BUILDING.

When we build, let us think that we build for ever. Let it not be for present delight, nor for present use alone; let it be such work as our descendants will thank us for, and let us think, as we lay stone on stone, that a time is to come when those stones will be held sacred because our hands have touched them, and that men will say as they look upon the labour and wrought substance of them, "See! this our fathers did for us."—J. RUSKIN.

THE WEEK.

It is much to be regretted that in the sudden realisation of the need of technical education there is a likelihood of fostering schemes which are not efficient. Lord ROSEBURY, for example, appears this week as the representative of trustees who have a large sum of money at their disposal for founding a London "Charlottenburg." He advocates the project by saying, "it is little short of a scandal that our own able and ambitious young men, eager to equip themselves with the most perfect technical training, should be compelled to resort to the universities of Germany or the United States." It has been pointed out by the British Consul in Stuttgart that English students do not utilise the advantages offered to them in Germany. Their numbers form only a small percentage of the foreigners. It is the same in America. To assign the principal part in the creation and maintenance of the new institution to the London County Council is not warranted by any experience of that body's manner of dealing with technical affairs. The Works Department might, in fact, be taken as evidence of the mismanagement which in ordinary businesses is driving people to German and American markets. When the Council has shown fitness to have contracts carried out in a systematic and economical manner it will be time enough to make it an authority for the highest class of industrial education. Nor is it easy to understand why Lord ROSEBURY should become an adviser for the purpose. He has never displayed any special interest in technical education, and, indeed, he may be instanced as the type of those gentlemen who have managed to succeed by luck rather than by labour or technical knowledge, and whose connection with manufactures has been one of the causes of the present condition of affairs. The only body that hitherto can claim to be successful in the promotion of technical education is the Council of the City and Guilds of London Institute. Their two colleges in London have, if all things are taken into account, turned out a surprising number of captains of industry. The amount received in fees from students is not one-third of the expenditure, and the general administration amounts to only 1,264*l.* per annum. Here we have the nucleus of an excellent system as well as experience. With an executive including among the members Sir J. WOLFE BARRY, Sir FREDERICK BRAMWELL, the Presidents of the Royal Society, the Institution of Civil Engineers and the Chemical Society, and the Chairman of the Society of Arts, Lord KELVIN, Mr. MATTHEY, &c., and various representatives of industrialism, there is a body of directors available with which the politicians of the London County Council are not to be compared.

THE collapse of the bridge across the river Ouse at Uckfield on Saturday last should be enough to move county councils to have similar structures closely examined. People are so accustomed to the duration of bridges under ordinary traffic, they are supposed to have faith in their endurance under all circumstances. The bridge which succumbed was erected in 1858, and took the place of an old masonry bridge dating from 1617. The bridge connected one side of Uckfield with the other and was constructed of brickwork and cast-iron. The cause of the accident was the passing of a traction-engine, which fell into the river. The gas-pipes, water-mains and sewers were all broken and

much inconvenience resulted. Fortunately there is a station of the London, Brighton and South Coast Railway near the bridge. The company's workmen gave their assistance and a temporary bridge was put up during the night. At the next meeting of the Council it will be decided what kind of bridge is to be adopted. The traction engine, which was the proximate cause of the collapse, was exceeded in weight by another, which safely crossed the bridge earlier on Saturday. It is not improbable that traffic of that kind exercised some influence on the cast-iron girders and weakened their power to resist a strain. We cannot, however, obtain precise information on the subject, for the County Council have taken no steps to make a thorough investigation of the state of the bridge. All over the country there are examples of old-fashioned bridges which are subjected to a class of traffic unknown when they were constructed, and they are being gradually weakened by it without any measures being taken to add to their strength.

WHEN EBENEZER ELLIOTT, the Corn Law rhymer, was writing about mechanics, his ideal was to see a man of that class throned in an elbow chair, or reading LOCKE while reclining on a sofa, and the visitor was not expected to show surprise when he saw a carpet on the floor. So much luxury was not supposed to be ostentation. ELLIOTT looked on it as partly arising from taste, which he said was "the link which binds us to the skies—a bridge of rainbows thrown across the gulf of tears and sighs." The English mechanic has advanced since those days, and it is his own fault if he does not possess such a home as ELLIOTT saw in poetic vision. The claim for what would then be regarded as luxury, but happily is now only convenience, was brought before the London County Council on Tuesday. The housing of the working classes committee recommended "That, without in any way diminishing the quality of the constructional work in the Council's cottages or curtailing the area of the living space provided, the housing of the working classes committee be permitted to rearrange the rooms so as to allow of the provision of the same number of rooms or cubicles of varying sizes in lieu of all rooms being of a compulsory minimum size." The tenants of the new cottages erected by the Council wish to have a room in each tenement which should be used as a parlour or ceremonial-room. The committee thought that the space wasted in a room of the kind might be partially thrown into the living room. The committee are, however, bound by certain regulations. There are at present four classes of cottages at Totterdown Fields. For one containing three bedrooms, a parlour, a living-room and scullery, the rent is 11*s.* 6*d.* per week, but there is a demand for the cottages. The second class is 8*s.* 6*d.* a week, the third 7*s.* 6*d.* The fourth class, which the committee expected would be most popular, seems to be avoided, for the accommodation of a bedroom, a living room, and a scullery with a kitchen range, is considered to be insufficient. The committee, therefore, sought powers to deviate from the normal type and this was granted. The desire of the working-classes for superior and increased accommodation is a satisfactory sign of increased self-respect, and is one which architects will be glad to foster in preparing plans of such dwellings.

EXETER CATHEDRAL.*

"HAPPY are the people who have no history" is a familiar saying. It might have originated with some ancient philosopher of Exeter, and if so it would have been heartily appreciated in the settlement. Exeter, as we know, was important in the historical sense. But the inhabitants at all times have shown small anxiety about recording events for the benefit of posterity. The city is now somewhat of an easy-going place, with little of the exhausting excitement which we see elsewhere. The climate must have always disposed men to lassitude, and the Romans perhaps looked upon the district as if it were a fit residence for lotus-eaters. To them it was Isca Damnoniorum. Why did they select it, or did they gain it by conquest? There is no telling. VESPASIAN is supposed to have gone there in order to recover possession of it, but some coins are seemingly the only palpable evidence of Roman occupation.

After the Romans departed from Britain, Exeter may have had some share in the troubles which followed. The Saxon flood swept the British race westward. But, as well as can be made out, Saxons and Britons appear to have yielded to the influence of the district, and to have considered it was better to enjoy life at Isca while elsewhere there was fighting for superiority. The Danes presumably heard of so happy a region and tried to gain a footing there, but it was only for a brief period. The people were willing to fight bravely when invaded, but on condition they were allowed to revert to their quiescent life. We have an indication of the spirit, or want of spirit, which prevailed. The river Exe was an open way which was free to rovers, and the Saxon king EDWARD laid it as an injunction on his Council that they should investigate the means necessary to make the river less of a danger. Not even the fear of Northmen was sufficient to rouse the inhabitants to take precautions. But in all these centuries we find merely allusions to occasional incidents, and it is absolutely impossible to make out any abstract of the annals of Exeter, even at the rate of one entry in a century.

We are now concerned only with the ecclesiastical history of Exeter. There seems to have been some sort of connection between Chichester and Exeter. As in other things, it is unwise to seek any precision on the subject. But as the ancient seat of the Sussex bishopric was Selsea, so in Devonshire the bishopric was in Crediton. A church dedicated to St. PETER existed at Exeter, which, from the name, was possibly founded by some Roman Christians. There was, however, no ambition to impart to it higher ecclesiastical rank. The Exeter people would have been no doubt quite satisfied if the cathedral at Crediton and its bishop were at a more remote distance from them. Reformers, however, are always springing up who are wishful to disturb established customs, and one of them arose in the middle of the eleventh century in LEOFRIC, the chancellor of EDWARD THE CONFESSOR, who was appointed bishop of Crediton. At the time most parts of Devonshire and Cornwall were in a disturbed state and constantly liable to invasions. LEOFRIC wished to gain security, and he sought an amalgamation of the Cornish and Devon dioceses. It was a novel proposal, and required some diplomacy to realise. The king agreed, and in his grant he declares, "I, EDWARD, place this privilege, or charter, with my own hand upon the altar of St. Peter, and, leading the prelate LEOFRIC by the right arm and my Queen EADITHA leading him by the left, do place him in the episcopal chair, my dukes and noble cousins, with my chaplains, being present." The importance attached to the queen was due to the circumstance that Exeter was then a part of the property settled upon her. Prior to the murder of BRIANTRIC, king of Wessex, the consort of the king, or Cyning, was recognised as a queen, but afterwards she was termed "the lady." By courtesy, especially in documents written in Latin, she was called "regina."

In any other place there would be some document to demonstrate whether LEOFRIC built a cathedral, but in Exeter, as we have said, there was indifference towards the most important events. The monastery of St. PETER was supposed to have been founded for Benedictine monks.

There were eight monks in residence at the time of change. They were sent to Westminster and canons or prebendaries took their place. LEOFRIC was installed in 1050, and he was allowed to retain possession of the see after the Norman Conquest. He died in 1072. From his will it is evident that he recovered some of the monastic possessions for the benefit of the see. All his property he left for church purposes. He was succeeded by OSBERN, a Norman, who ruled from 1072 until 1103. Exeter then contained about 360 houses, of which forty-seven belonged to the bishop. The property in land was extensive.

The first of the building bishops was WILLIAM WARELWAST, who presided from 1107 to 1136. The interim of four years was caused by some differences which had arisen between HENRY I. and the Pope over episcopal appointments. A compromise was effected, and WILLIAM, who had been chaplain to RUFUS as well as HENRY, and who showed himself to be a partisan of the King rather than of the Pope, obtained the see of Exeter. One of the obscure problems connected with the history of the cathedral relates to the constructional operations by the bishop and his successors. The cathedral has the peculiarity of a tower on the north and one on the south side. They now form the transepts, but it has been suggested that originally they were detached from the main body of the church. They are both Norman, but the northern tower exhibits details which almost belong to the Transition period. At Châlons-sur-Marne, Lyons, Angoulême, and Geneva there are similar towers. The towers served no use that can now be ascertained. It has been declared they were intended as castles, which were a fetish with the Normans, and supposed to be invaluable in scaring the conquered natives.

It is thought that the Norman church coincided with the present nave and aisles and with the three western bays of the choir. If we wish to appear better informed we must trust to speculation or imagination. In 1194 HENRY MARSHALL, or MARISCALL, brother of the Earl of PEMBROKE, was consecrated bishop, and he is said "to have finished the building of his church according to the plat and foundation which his predecessors had leide." It is inferred that he extended the choir, erected several chapels, a north porch and other works. WALTER BRONSCOMBE restored chapels, but his love of building was more markedly expressed in other parts of the diocese. The death of BRONSCOMBE brings the history of this cathedral to 1280. At such a time not only was Norman work superseded, but the Pointed style had developed. It was not to be expected that if money were at command much reverence should be shown to the work of predecessors, part of which was nearly 200 years old. It was therefore decided to make a clean sweep of the early work, with the exception of the towers. Some of the walling was utilised, for we presume the services were continued. But care was taken to conceal all old masonry. When so much is said about restoration in all forms, we ought for the sake of consistency to condemn the men who showed such little regard for antiquity. We cannot suppose that the Norman church of Exeter was superior to the Norman church of Chichester. Would visitors from all lands who enjoy the sight of every part of Exeter Cathedral wish to see it brought back to a state corresponding to that of Chichester, which makes so many strangers shiver as if they had unexpectedly entered a tomb? Masonry for its own sake is not long admired. There needs some extraordinary circumstance, as the murder in Canterbury Cathedral, to make people take an interest in forms which have ceased to correspond with their accepted theories of beauty. It has been asserted there is a duty on us to conserve everything that is ancient as evidence of continuity. Posterity is not always grateful for the legacy.

It is to PETER QUIVIL, who was elected in 1280, that we owe the great transformation. He died eleven years afterwards from too hastily swallowing a syrup. As he was archdeacon of St. Davids and a canon of Exeter he may have long meditated on the work demanded. There is a tendency in narrating the history of English cathedrals to give the whole credit for improvements to one man. If we possessed such information as is found in monastic chronicles, we might discover that for many years the modernising of the cathedral was debated by the bishop

* See Illustration.

and canons, and the capital had been acquired to enable the works, when once started, to be carried on without intermission. There must have been a matured plan in the Exeter case, for at first sight the interior appears to be almost as uniform as that of Salisbury. Yet the main works occupied nearly a century, and indeed, if all details are taken into account, the operations lasted for about two centuries and a half. There are changes in detail, for there is a difference between the work of the Decorated period and that of the Perpendicular, but to a general observer the unity of the building is one of its striking qualities.

It is remarkable what a succession of lovers of building was enjoyed by Exeter, who were loyal to the ideas of Bishop QUIVIL. THOMAS BITTON, his successor, devoted himself mainly to work in the choir. As a rule that part always was allowed priority. He lived until 1307. Then came WALTER STAPELDON. He had been Lord Treasurer to EDWARD II., but he was most enthusiastic about his new duties. His end was tragic. He was entrusted with the government of London, but as he was reputed to be an enemy of Queen ISABELLA, and to have interfered with the arrangements for hearing lawsuits in London, he incurred the enmity of the citizens. He was killed at Cheapside, and his head fixed on a pole. His first undertaking seems to have been the painting of the choir. He also completed the arcading above the arches or triforium. There was a great amount of glazing executed during his episcopacy. It was also his privilege to provide the high altar, which, if not of silver, had a silver slab, probably the part carrying the altar stone. He is also credited with a screen which no longer exists, and of which the object is doubtful. The organ in the fourteenth century was simpler than ours, and it may have been employed for the Mediæval instruments as well as other purposes. Exeter also possessed a minstrels' gallery. STAPELDON must always occupy a large part in every history of the cathedral. This arises partly from the variety of his undertakings, although they may not have been in one sense as important as the masonry. Another reason is that the fabric rolls record with some fulness the expenses for which he was responsible.

JAMES BERKELEY held the office for only a few months, and although he was famous as being godly and wise he had no opportunity to perpetuate his name in masonry. JOHN GRANDISSON was another politician; he had discovered the art of acquiring wealth, and it amazed people that a prelate who was responsible for such heavy building expenses should have been able to leave legacies not only to churches, colleges and prelates, but to the Pope, the Emperor, the King and the Queen. One of his first acts was to clear off the debt due to WILLIAM CANON, of Corfe, for marbles. He had also to grapple with the great task of altering the nave. From an arrangement made with the mason, it is evident that marble had been provided, but somehow had suffered injury, and it was necessary the defects should be remedied and columns which had been lying about set in their proper places. The operations are supposed to have occupied nine years. Some of the stone may have been ordered by Bishop QUIVIL nearly forty years before the time of the arrangement. It should here be mentioned that the diocese supplied the greater part of the stone required in the building. The stones in the foundations were brought from Whipton, in Heavitree parish, and from Berlegh, or Barley. The outer walls are built of stone from quarries in Salcombe and Branscombe. The vaulting is of Beer stone and the keystones from Silvertown. According to Archdeacon FREEMAN, "the coarser red sandstones of Wonford and Whipton were used for the sub-bases under the pillars; the delicate and creamy tinted variety from Salcombe and Branscombe (midway, locally and geologically, between our reds and whites) for the interior walls; the semi-volcanic or trap of Silvertown and Thorverton for outward facings or for the infillings of the vault; the slabs of Hamhill for steps, like those of the altar; and the pocombe from Barley, good for paving, and used with happy effect, alternately, with Ipplepen and other marbles in the restored lady chapel; finally, the soft-grained products of Beer and Caen for every kind of sculpture." Caen stone was imported in QUIVIL's time.

GRANDISSON is stated to have achieved the completion of the buildings in 1350, but work still remained to be done

in the windows, and there was the sculpture in the west front. The towers were also altered, a chapter-house was erected and a cloister, although the latter is a novelty in a cathedral.

It is a misfortune at Exeter that the first impression of the cathedral which the visitor receives on approaching the west front is unfavourable. The site is not elevated, and the treatment of that part makes the building appear squat. The soaring spirit which designers and masons were so competent to express has to be sought elsewhere. The west front possesses, indeed, little right to be considered as architectural. All through the history of the building, amidst the mass of details given concerning payments to contractors and workmen we do not learn anything about an architect or a designer. The screen might have been the outcome of a contract with carvers who were prepared to bring it to completion without any supervision. There is no sense of measure, no composition, for on looking at it we feel that the rows of statues could be extended on the northern and southern sides to an unlimited extent. The screen has also the disadvantage that there is no dominant figure. Patriarchs, apostles, kings, saints, all appear in order, and for no other purpose except to show themselves to the spectator. That is the reason, no doubt, why FLAXMAN, who speaks so warmly about Mediæval sculpture, does not, if we remember rightly, condescend to notice Exeter Cathedral. He had no hesitation in comparing the sculpture at Wells to that by the great Italian artists. But at Wells all the figures are subservient to the Almighty JUDGE. In fact, it would be an advantage if the visitor could be blindfolded before he enters Exeter Cathedral and to postpone seeing the west front until the interior had been exhausted.

As we have said, it is not unlikely that while the works of the building bishops were in progress it was necessary to use the Norman building. In our time, with improved aids and appliances, the difficulties of the builder are increased when there has to be an arrangement of that kind. In the fourteenth century it was more of a task to overcome the obstacles. The regularity with which the entire length of the cathedral is carried out becomes then more remarkable. Although there was an abundance of stone, those used in the piers are not very large. But the mouldings could not be more true if they were executed by machinery. The vaulting is comparatively simple, for there was no desire to make a congregation wonder why the stones did not fall on their heads. The triforium may be considered as wanting in depth, and therefore in dignity. But there must have been some difficulties with regard to height with which we are unacquainted. The efforts to surprise and to display the fancies of particular sculptors which were allowable in Mediæval times are not to be seen at Exeter. When we consider all the circumstances and remember that for a long period between the erection of the Norman building and the coming of Bishop QUIVIL there could have been little training for masons in Exeter, the satisfactory character of the work is enough to make us wonder. We can also see the most beautiful episcopal throne to be found in England, miserably devoid of objectionable features, unrivalled sedilia, fanciful vaulting shafts, and if to these be added the colouring and gilding as well as the stained glass in some of the windows, we may be able to form for ourselves some idea of the splendid appearance which the building must have presented to the eyes of all classes of people.

The Reformation does not appear to have brought much danger to the cathedral, at least while HENRY VIII. was on the throne. Under the reign of EDWARD VI. some of the treasures were confiscated, but we believe the money derived from them was utilised for public works. With ELIZABETH the chapter was deprived of some of its landed property, but on the whole Exeter fared better than most cathedrals. At the time of the Civil War it fell into the hands of the Parliamentary troops, but it is doubtful whether all the havoc was committed which we find described by Royalist writers. One curious arrangement which was carried out was that the cathedral was divided by a brick wall in order that there might be separate services for Independents and Presbyterians. After the Restoration the see was given to JOHN GAUDEN, to whom the authorship of the *Eikon Basilike* is ascribed. The

cathedral fared no better than the other buildings of its class during the later period of indifference to Mediæval art.

BUILDING SUPERINTENDENCE.*

THE late Professor HAYTER LEWIS used to say that no class of information relating to buildings was more desirable than what could be derived from accounts of failures. Man is not always perfect, as physicians and surgeons can testify, and his work corresponds with his weakness. Building is a complex operation in which many have to co-operate, and the possibility of a variety of errors is never absent. The causes may sometimes be traced to the initial stages, for errors are due to building-owners possessing only the vaguest ideas of what they require. But who would have the courage to afford the particulars which are needed? No one objects to the accounts of failures in the human mechanism announced every week in the medical journals, nor is a doctor likely to suffer when he records changes in a patient's treatment, although they are acknowledgments that originally he was wrong in his diagnosis. But it would be hazardous to describe errors in plans or superintendence, although the Courts make allowance for the fallibility of architects. By-laws and municipal regulations may be considered as precautions to limit a builder's liability to err, and a man who complies with them is sure to have no misgivings about doing his duty. Then we have workmen who are thoughtless, and indifferent whether they are charged with other mistakes besides those they have committed. There is no doubt that money is wasted through failures every year in all parts of the world where buildings are erected, and those best acquainted with the circumstance are not always able to point out a remedy.

Failures in building did not originate in our time, although from what is sometimes said it might be imagined they were unknown in the past. The Mediæval masons were supposed to go through their daily tasks as if they were performing religious duties. Much used to be said about "the elder days of art, when builders wrought with greatest care each minute and unseen part." But the discoveries made during the restoration of cathedrals and churches have cast much doubt on the honesty of the Mediæval builders. They also were disposed to scamp whatever was not visible, and were acquainted with as many tricks as their successors. In such instances the prices probably were low. The hurry which is a characteristic of our age, and which demands expedition in all things, has increased the tendency to failure. In the United States, where there is still more haste than in England, it is inevitable that imperfect work should be executed unless where machinery has superseded hand-labour. The reports of the Mosely Industrial Commission, to which we lately referred, are by themselves sufficient proof of the carelessness with which American buildings are executed. The bricklayer states there is no pretext and no attempt to properly bond the brickwork. The plasterer says his work is far and away behind that executed in England. There is much else to the same effect, but, as we have already commented on the reports, we need not go further into the subject.

The book by Mr. T. M. CLARK may be regarded as a warning to young architects about what will be foisted upon them by builders and workmen unless they are always wide-awake and keep their eyes open for detection of defects. Judged by the pages, it would appear that the building superintendent is the only man to whom the American people must look if they desire buildings which will endure and will not require an excessive outlay on repairs. He is told that he must not blindly trust to the accuracy of the plans. If, for instance, "the drawings show stone and brickwork bonded together in elevation, it should be his duty at once to procure bricks of the kind to be used in the facing, and lay them up with mortar joints of the usual or specified width, in order to ascertain with certainty the

height which a given number of courses of brick will lay." The words are alone sufficient to explain why American architects are not always favourable to quantity-taking, for how could brickwork be taken off with accuracy from plans when there is no respect for standard sizes?

Mr. CLARK is not satisfied with generalities which may become vague. He takes three classes of buildings—a stone church, a wooden house and a steel-framed structure—and he goes systematically through all parts from the foundations to the summit. In some points we find a correspondence with English work and read of faults which are familiar. They are made more explicit by the aid of numerous woodcuts. The author does not always adopt the professional manner. He endeavours to render his descriptions clear by turning them into incidents which have occurred. For example, when speaking of laying concrete he supposes the wary superintendent is struck by the spick-and-span appearance of the piers and the presence of a few stray pebbles about the pit. The following dialogue ensues:—

Superintendent: Mr. Foreman, how did you get this pier done so soon?

Foreman: Well, sir, we hurried a little on this pier because we wanted it to get set before it rained, and—

Superintendent: I left word to put in only 12 inches of concrete at a time in each pier.

Foreman: O law, sir! that ain't no way to build a pier. There ain't no one can tell me nothin' about concrete. That's as nice a job of concrete as ever—

Superintendent (remembering the scattered pebbles): You didn't put the stones in dry and then grout them, did you?

Foreman (slightly taken aback): Well, sir, perhaps—yes, we did; you see that is the best way to do where you have such coarse sand, and then—

Superintendent: Get some one here and take that all out. It is impossible to tell now how much cement there is in it, but it has not begun to set, so if you take it back to the pen and add a shovelful of cement to every two shovelfuls of this, and mix it well, I will let it pass into all the piers 12 inches thick.

Foreman (deferentially): Yes, sir; anything you say, sir.

In England if a similar scene occurred the language heard would be somewhat stronger. But the Americans have more control of temper, and it is necessary to be respectful even to a foreman. Another suggestion of American methods is given in what is said about mortar being one-half cement. Mr. CLARK remarks, "Let the contractor and his men understand that this means one cask of cement to each cask of lime, not one-half barrel of cement to one of lime as some masons pretend to interpret it." It is strange that there should be trickery in materials, although by American law and custom only the best is presumed to be intended where nothing is stated to the contrary in specifications. Everything must, however, be scrutinised. From the chapters in the book we might suppose that deception is as much due to the nature of particular workmen as to any implied desire of the contractor. Indeed, it is advised that the superintendent should be rigorous as much for the sake of the contractor as for his own. Fires are so common in America it is recommended that the ends of beams which are built into a wall should be bevelled at the ends, that is, forming an acute angle instead of a right angle. The reason is, "that they drop out quietly when their outer ends are consumed, but if left square the portion in the wall acts as the short arm of a powerful lever whose outer end being depressed as the floor falls, prises the wall outward with immense force." We gave above an instance of the manner of dealing with concrete piers which is sometimes practised. A companion is the description of brick piers which we now extract:—

We will inspect the brick piers which support the girders in the main cellar. Of these there are rather more than is necessary, the plan showing them spaced but 6 feet apart from centres. A few only have been built, of well-formed hard brick, 12 inches square, as the plan shows, but with joints of a suspicious grey-blue colour instead of brown. They have been completed some three days, but we find that a knife-blade easily penetrates the mortar after the outer crust is pierced. Calling the mason, we ask him if the piers were laid in sand and cement only, without lime, as the specification required. He answers with considerable hesitation that "A little lime might perhaps have been put in, but it is mostly cement."

* *Building Superintendence: a Manual for Young Architects, Students and others interested in Building Operations as carried on at the Present Day.* By T. M. Clark. New edition. (New York: The Macmillan Company.)

Our suspicions are not allayed, and we ask to see the cask from which the cement was taken, and to have the mortar mixer brought before us. The former is about to disappear in search of these witnesses, but we detain him and send a boy in his stead, who does not return; and after a good deal of writhing our captive confesses, being confronted with the soft mortar, that there was no cement on the ground at the time, and he had had the piers built with the best mortar he could possibly make with the materials at hand.

"What did you colour the mortar with to make it so dark?" we ask; and the foreman replies, "Well, we didn't suppose you would know the difference, so we sent over to the grocery store, and got some lampblack and mixed it in."

We impress upon his mind our objection to such tricks by ordering all the piers to be demolished in our presence, and dismiss him with an admonition.

In the society-room of the church, which is of large size, there is one girder 40 feet long, supported by a column in the middle. The superintendent finds the girder is less than a third as strong as it should be. He notifies the architect, who in reply informs him that in his haste he erased two other columns from the plan, and intended to make another arrangement about the girder, but it had "slipped his mind." He did not wish to dictate how the error was to be remedied, but left the matter wholly to the superintendent, in whom he expresses confidence. Mr. CLARK apologises for representing his architect as liable to make mistakes. But how is his hero the superintendent to display his ability unless occasions are offered him?

The chapter on steel-framed buildings reveals that this essentially American development occasionally retains the defects which are common in an earlier class of construction. The concrete employed is likely to be without strength, for "workmen rarely have any conception of the requisites for good concrete, and do not hesitate to smuggle in portions reduced to mere mud by the forgetfulness of the men whose duty it is to turn off the water, without knowing or caring that a streak of this sort may form a dangerous seam in the mass." At the rolling mills experts are employed to make tests, and the owners conscientiously endeavour to produce efficient material. But the workmanship is of a different kind. There is sometimes irregular punching, and the holes have to be widened by a driftpin, by which the metal is weakened.

We have said enough to suggest the character of the volume. As in some of VIOLLET-LE-DUC's books, an effort is made to impart animation to the instructions, and in that way the young superintendent is better able to realise the forces with whom he will have to contend. We have pictures, as it were, of American methods, and it often happens they bear a resemblance to our own. The use of the volume is not therefore confined to American cities, for the warnings might well be hearkened to by those who take charge of building operations in this country.

THE PROPOSED LIBRARY, STRATFORD-ON-AVON.

THE following statement has been issued by Mr. Sidney Lee:—At the beginning of this year I was elected a trustee of Shakespeare's birthplace, an honour which I highly appreciated. Within a few days of my election as trustee of the birthplace I had to leave England to fulfil a series of long-standing engagements in America, whence I am just returned. Rumours reached me in America that my fellow-trustees proposed to remove or alter various buildings adjoining Shakespeare's birthplace, and that public opinion was, on literary and artistic grounds, strongly excited by this course of action.

As soon as I arrived home I made careful inquiry into the origin of these rumours, and after due investigation of the circumstances I have now assured myself that the public has been misled on almost all the essential points. Spasmodic endeavours have been made to remove the misconceptions from the public mind, but they persist in many quarters. I believe it to be to the public advantage and in the interests of truth to set forth clearly the full facts of the case. The public may then be in a position to form a judgment on the subject which shall be final. But it should be understood that I take this step on my sole personal responsibility.

Put briefly and stripped of flowers of speech, the charges alleged against the trustees were two. First, it was stated that they were wantonly bent on destroying the historic aspect of Henley Street, in which Shakespeare's birthplace stands, by

arranging for the demolition of houses of historic interest, which had lately come into their possession, in the immediate neighbourhood of the birthplace. Secondly, the trustees were accused of conspiring with the Corporation of Stratford-on-Avon to apply to the purposes of a free public library another building of ancient date which was situated in the same street in close proximity to the birthplace.

Two separate issues have been raised in the strife and have not always been kept adequately distinct. The trustees of the birthplace, as constituted by the Act of Parliament of 1891, form a body that is quite independent of the Corporation of Stratford. The Act gives the Corporation a large representation on the board of trustees, but each body has its own statutory functions. In regard to the present issues, the trustees are solely concerned with the fate of the cottages in immediate proximity to the birthplace garden, which were purchased by Mr. Carnegie for presentation to them. The second issue touches the fate of another building, which, although it adjoins this newly acquired property of the trustees, belongs to the Corporation, and has, in the exercise of that body's exclusive discretion, been appropriated by it to the projected free library.

The trustees are charged by Miss Corelli with neglecting to preserve "the present irregular beauty of historic Henley Street." As recently as last month she wrote that "if the proposed alterations are carried out, not a scrap of the original side of Henley Street as thousands of pilgrims have known and seen it will remain." One critic described the street as "a thing of peculiar value," which "once changed . . . will be lost for ever." "Let Shakespeare's street alone," cried another. "Leave the sacred side of Henley Street uncontaminated by modern bricks and mortar." These adjurations may be admirable in sentiment. But the remorseless hand of time robbed them of practical significance or of relevance to the present issue more than a hundred years ago. Henley Street is undoubtedly one of the oldest in the town. Its records date from the Middle Ages. But no part of Stratford underwent more frequent and more complete renovation between the date of Shakespeare's death and the end of the last century. As the little Elizabethan or Jacobean houses of timber and rough-cast fell in the course of ages into decay they were from time to time replaced by new structures, usually wholly of brick. More than sixty houses form the street. The owners (of all but two or three, belonging to the Corporation) were private persons in humble circumstances, who naturally carried out the needful renovations with a sole regard to economy, and with no consciousness of sentimental considerations. As a result the street, with the exception of one short strip, has long been lined by low, featureless brick-fronted tenements, ranging in date through all the decades of the nineteenth century. One large section, on the side of the street almost directly opposite to Shakespeare's birthplace, is barely four years old. Its architecture is of obtrusively suburban type. In some instances when the buildings fell to ruin and reconstruction became inevitable, the interior timber supports were retained in order to save expense, and relics of ancient workmanship of no very romantic character were by economic accident and by no archaeological design incorporated in the reconstructed edifices. But even here new flat brick fronts, fashioned entirely of modern material, invariably displaced the old timber façades with their overhanging storeys.

It is common knowledge that Shakespeare's birthplace, with the adjoining house, which was also his father's property, is now distinguished (among other things) from the rest of the street by enjoying permanent protection from the vicissitudes to which its neighbours have always been liable. Last year Mr. Carnegie purchased for presentation to the trustees a row of four cottages on the east side of the birthplace, where the risk of fire was chiefly imminent.

Mr. Carnegie reserved to the Corporation the right of appropriating to its own purposes a small portion of the site of these four cottages, of which the precise extent was to be defined by mutual arrangement between the trustees and the Corporation. The transaction was only carried through at the expenditure of much time and money. Mr. Carnegie's intervention was, indeed, peculiarly opportune on more grounds than were foreseen. The owner of the three cottages furthest from the birthplace had been a refreshment caterer on a modest scale. It now proved that she intended to convert her three tenements into a single restaurant or tea-shop of an orthodox modern pattern. It was only on payment of a very large sum (2,000*l.*) that she relinquished her resolve of establishing a restaurant on what (she argued) was, from its proximity to the birthplace, with its annual army of visitors, the best site for such a purpose in the town. Thus, by a happy coincidence, Mr. Carnegie's purchase protected the birthplace not only from peril of fire but from peril of proximity to a most incongruous innovation.

No conspicuous historic nor archaeological interest attached to any of the four houses. The two furthest removed from the birthplace were little better than hovels. They had been

crudely built of cheap modern brick within living memory, were innocent of all architectural features and were at the back in ruinous condition. These two tenements have been recently demolished, and the site is to be converted into a garden. The other two cottages nearest the birthplace boast a more reputable record. About 1810 the old timber front with an overhanging storey was removed, and a new flat brick front with projecting windows was set up in its stead. But despite other repairs of later date, the ancient timber of the side walls, the timber-beams of the roof and an open fireplace with inglenook and chimney-corner seats were suffered to survive. A thorough survey led the trustees to the conclusion that the old work inside these cottages rendered their preservation desirable. The expert advice of Mr. J. A. Cossins, the architect who represents at Birmingham the Society for the Protection of Ancient Buildings, showed that it would be easy to renew the ancient shape of the interior. The harmless nineteenth-century brick façade has neither architectural nor archaeological value, but I believe that the trustees propose to leave it standing for the present. The garden, formed of the unoccupied land whence the two adjacent hovels have been removed, will now bound these cottages on their eastern side. Thus the object of isolating the birthplace, which the purchase of the four cottages was intended by Mr. Carnegie to secure, will be fully attained.

I now turn to the action of the Corporation in the matter of the free library. Here, too, I find that the censorious clamour rests on everything except accurate knowledge. The need or desire of a public library in Stratford has been impugned. Undoubtedly there are in the town two good Shakespearean collections of books, each devoted to a particular department of the subject; one of these special collections is in the birthplace museum, the other is in the Shakespeare Memorial. But the existence of these collections—admirable as they are in their own way—has little bearing on the present question. These Shakespearean collections have nothing in common with a library destined to serve the general purposes of the Stratford public. At present the numerous readers and students among the rank-and-file of the Stratford townfolk are without free access to any general literature apart from Shakespeare—to works of reference, to standard treatises of science or art, to newspapers and periodicals.

Mr. Carnegie's gift did not originate the library movement there. Before that was in question efforts were made to establish a free library, and it was understood at Stratford that Miss Corelli, who now attacks both trustees and Corporation on the ground that the town "has never sought a free library at all," generously proposed to provide a site for a free library or reading-room, in furtherance of the townfolk's wishes. "Before any mention was made of the proposed gift of a free library to Stratford-on-Avon by Mr. Carnegie," wrote Mr. Fred Winter, an active citizen of Stratford, to the *Stratford-upon-Avon Herald* on June 12, "I was asked to obtain for Miss Corelli a price for the piece of land (then belonging to Mr. John Wright) adjoining the Technical School in Henley Street, for the purpose of a free library." It would therefore seem that Miss Corelli thought to locate her library or reading-room in "historic Henley Street." [This has been denied.]

The circumstances of the case excluded from the Corporation's consideration an elaborate architectural design. The cost of maintaining the new library was to fall on the rates, and the rateable value of a little town like Stratford was quite small. The selection of the Henley Street site was induced by like imperative practical considerations, and despite all the bold assertions to the contrary, no rational archaeological interests are jeopardised thereby. The Corporation already owned in Henley Street premises which, though they were long occupied as a china shop, could be turned to municipal uses with the smallest possible burden to the ratepayers. This arrangement was at once sanctioned by the Local Government Board. On one side these premises were bounded by the row of cottages which were to be transferred by Mr. Carnegie to the birthplace trustees. On the other side stood the vacant land of which Miss Corelli would appear to have contemplated the purchase. To unite that still vacant plot with the adjacent site of the Corporation's premises was eminently desirable on grounds alike economical and archaeological. It was well known that were the vacant land not soon secured for public purposes, it was destined for a new shop of unattractive modern type, and Mr. Edgar Flower, whose liberality and zeal for the welfare of Stratford are as conspicuous as his artistic skill and knowledge, rendered the town the best of services, from every point of view, by purchasing the vacant land at the price asked by its owner, and by handing it over to the Corporation to form part of the site of the new library.

Of all the censure passed on the Corporation or trustees in the course of the controversy probably the least justifiable is the adverse criticism levelled at the Corporation on account of the policy that it adopted in regard to its Henley Street premises (now used as a china shop). All manner of erroneous information has been put into circulation on the subject. The present condition and the historical associations of the building

have been recklessly misrepresented. It has been christened, quite erroneously, "the house of Shakespeare's cousin," and that misnomer has even defaced a resolution passed by the British Archaeological Association. The fact that the Corporation was patiently taking the best advice with a view to preserving in the building whatever was of ancient value was ignored. It was stated over and over again that the Corporation had obstinately resolved to destroy it root and branch. The authentic history of the premises is extant in the Corporation archives.

The house is now in a very bad state. The greater part of the parapet of the modern brick front has fallen down. In the ordinary course of events the Corporation would be obliged to provide for the house's entire reconstruction. The assignment of the premises to a public object renders possible renovation less drastic and in fuller harmony with archaeological sentiment. At the invitation of the library committee of the Corporation, Mr. Thackeray Turner, the secretary of the Society for the Protection of Public Buildings, in company with another member, inspected the china shop premises on May 29. The Society's report is in full accord with all that the Stratford authorities have done or intended doing.

Thus it will be recognised that, so far from destroying "historic Henley Street," the trustees and the Corporation, through the generous aid of Mr. Carnegie, are doing precisely the opposite. They are permanently preserving all structural work in houses under their control there which has proved on accurate examination to possess any kind of archaeological interest. The process of modernising Henley Street had in past years progressed very far, and of late, but for Mr. Carnegie's interposition, threatened a conspicuous advance. That process has now, at an interesting point in the thoroughfare, been arrested, and some careful and scholarly restoration has been made practicable.

THE OLD MARKET HALL AT WINSTER.

THE limestone districts of the Peak are dotted with small ancient towns and villages, but not many of them, says Mr. W. Smithard, can boast of a building older than their parish church, and secular structures of Mediæval date are exceedingly rare everywhere in the county. The upland town of Winster, therefore, is doubly exceptional in that its church is quite modern, whilst it possesses a thirteenth-century market hall. This quaint little structure is situated at the southern side of the main road, which runs from east to west, and is of unusually liberal width. Winster was formerly a township of considerable importance amongst its neighbours, and until about forty years ago a well-attended general market was held there every Saturday, at which farmers sold their produce and bought manufactured goods, while the miners and other work-folk obtained there all the necessities of life, as well as some luxuries. Then the hall was the nucleus of a scene of active business and gaiety, which overflowed and spread itself into the spacious street; but after the railway was laid up the Derwent and Wye valleys, the equilibrium of local relationships was disturbed, and Winster was left in the cold, with the result that the market declined and eventually died out.

The market hall, which is rectangular in plan, is a two-storeyed building about 8 yards long, 5 yards wide and 30 feet high. The lower part consists of plain stone-pointed arches on very thick circular piers with round capitals, somewhat battered. In like manner to churches, the sides of the hall are built to face the cardinal points of the compass. Formerly the arches were open, but for some time past they have been filled up by a stone wall. The upper part of the building, dating from the seventeenth century, is of good red brick pierced with oblong stone-mullioned windows. It is roofed with thin sandstone slabs from adjacent rocks, which are very picturesque but excessively heavy. The roof lately has shown signs of collapse, and this is supposed to be due chiefly to the weight of the slabs, a portion of which have now been removed.

Since the hall has not been required for its original purpose it has served a number of baser uses in the character of stable, store-room or cart-shed, &c. It is now in possession of a Winster grocer. For many years the hall belonged to the Staley family at Winster, and it passed to its present owner for a small sum as lien on a lapsed mortgage. Formerly the tolls must have been valuable, but the ownership now carries no privilege, except right of usage as with ordinary buildings, though it involves the expense of maintaining the high road and pavements between the hall and the post-office. The interior woodwork—that is, floor, stairs, manger, &c.—is dilapidated and dirty, and the roof is in dangerous condition. The owner, therefore, is about to have the place thoroughly renovated and converted into a store-room for his shop goods. Its external appearance afterwards should not be much changed, for the walls are good. The owner talked of reroofing it with common slates, but it was pointed out to him this would quite

spoil the look of the hall, and he has now agreed to use again the original stone slabs or similar ones.

One cannot help regretting, however, that the Parish Council have not acquired the hall, knocked down the walls between the arches, and turned the upper room into a museum for specimens of local rocks, fossils, ores, &c. This unpretentious structure is, perhaps, the humblest of market halls, yet one admires it for its very humility as well as for its mellow tints on brick and stone, its softened lines and its historic associations. Small though it be it still tells us of the great principle of the Middle Ages—that every privilege carried a well-defined duty along with it. The hall is truly a unique relic of bygone Derbyshire, and it should be guarded with religious care.

In spite of apparent decadence, the inhabitants boast that Winster is still the richest village in the Peak. An unusual number of country craftsmen, such as saddlers, &c., find a home there. Near the market hall are several large stone houses, with handsome Classical fronts. The bulk of the working inhabitants find employment at the Mill Close lead mine,

NEW PREMISES, GLASGOW.

(See Illustration.)

THE new buildings for Messrs. STEWART & McDONALD's headquarters are in Glasgow. The frontages to Buchanan, Argyle and Mitchell Streets are 572 feet long and eight storeys high. The chief public entrance is at 146 Argyle Street, inside which is the principal staircase, which is 21 feet by 21 feet, and its traffic is relieved by two passenger hoists. The goods inlets and outlets are chiefly in Mitchell Street. There are two cart entrances and five other entrances. When the whole of the rebuilding is completed, the premises will contain 235,000 square feet of floorage. The whole is divided into six buildings by fireproof divisions, and the two last blocks are of fireproof construction. The prominent features and balconies are granite, the rest of the façades being of white sandstone. The archi-

DOORWAY, NEW PREMISES, GLASGOW.

the only one of importance now worked in Derbyshire, and from which several huge fortunes have been made. If ever that should come to grief it will be, indeed, a black day for Winster.

Satisfactory Progress is being made with the extensions to the Central station of the Caledonian Railway Company, Glasgow. The scheme includes the roofing-in of that portion of Argyll Street between Jamaica Street and Hope Street, and with the object of showing the height of the new structure the company, at the instance of the law and parliamentary bills committee of Glasgow Corporation, have fixed up ropes at various points in the street, which gives a fair idea of the size of the new station buildings. The ropes are 63 feet in length, and in order to carry them to the extreme point, a scaffolding of two storeys had to be erected on the top of the buildings.

tect is Mr. HORATIO K. BROMHEAD, F.R.I.B.A., Glasgow. The contractors are Messrs. P. & W. ANDERSON, masons; W. VICKERS, carver; JAMES GRANT, joiner; P. & W. McLELLAN, steel beams; M. McCULLOCH, cast-iron; M. SPEIRS & SON, plumbers; G. ROME & Co., plasterers; C. & J. MALLOCH, glaziers; Mr. JOHN BAXTER, measurer. Messrs. STEWART & McDONALD have branches in London, Edinburgh, Liverpool, Birmingham, Rochdale, Dublin, Leeds, Preston, Hull, Belfast, Newcastle, Sydney, Wellington, N.Z., Port Elizabeth, Toronto, Montreal and Melbourne. There are thirty-five departments in the business. Mr. ROBERT KEDIE is the senior partner, and the other partners are Mr. NINIAN B. STEWART and Mr. R. B. STEWART.

NOTES AND COMMENTS.

As the congress of the Sanitary Institute which is to open on Tuesday next, at Bradford, will be the twenty-first of the series, we may conclude that the experiment has been successful. The period of majority has been attained, and everyone who has watched the efforts of the Institute must desire that the progress henceforth will compensate for the labours required in earlier days. If we consider the number of attempts made by other societies to hold annual congresses during the last quarter of a century, and which have ended in failure, the success of the Institute becomes the more remarkable. There is no doubt that this result has been gained by the devotion of the Council, who were inspired by public rather than by personal interests. As far as possible local representatives are always secured for the various sections, and in that manner a general interest has been excited throughout the country. In Bradford the same course will be followed. The president is the Earl of STAMFORD. The local committee will have the mayor of Bradford (Alderman WADE) as chairman, with Dr. EVANS, the medical officer of health to the city, as secretary. Mr. MAURICE FITZMAURICE, C.M.G., the chief engineer to the London County Council, and whose name was connected with the Forth Bridge and the great dam at Assouan, will preside over Section II, in which the relations of architecture and engineering to sanitation will be discussed. At all the congresses the exhibition of sanitary appliances has formed the most popular feature. Visitors who might be puzzled by technical terms and scientific investigations find in the new inventions object-lessons which cannot be misunderstood. At Bradford the exhibition will be held at the Belle Vue Barracks. From the arrangements it is anticipated that the collection of objects will represent the most advanced applications of ingenuity in the service of sanitary science. Around Bradford there is much to be seen, and the principal manufacturing will be open to the inspection of members of the Institute. For those who believe that health is promoted by occasional relaxation, visits to fine scenery and to interesting buildings have been settled.

ARCHITECTS have good reason to be satisfied with the decision of Mr. Justice BUCKLEY in the case brought by the Commissioners of Woods and Forests against the Playhouse, Ltd., the lessees of His Majesty's Theatre. There are countless cases in London and in English towns which demonstrate that the owners and occupiers of buildings are indifferent to architectural lines, no matter what care may have been taken in devising them. They are sacrificed to painted announcements or to those in gas or electric lamps. Generally the architectural value of a building is minimised by the lettering, but that is not of much account if profit is believed to be increased by the sacrifice. It would hardly be considered necessary that so effective a building as the larger of the two theatres in the Haymarket should require any indication of its purpose by means of electric light. But a frame some 30 feet long with letters 1 foot 9 inches high was set up for that purpose. A crown was above. There was a covenant in the lease against such a desecration, and it was necessary to apply for an injunction to prevent the exhibition of the advertisement. There could be no defence for such conduct and the injunction was granted for the removal of the disfigurement. The defendants were ordered to pay costs. London would present a different appearance if a similar course could be adopted in the principal streets.

A LEGAL definition of a house which will be applicable to all cases has yet to be formulated. Nowhere is one so desirable as in the Law Courts. It is no use to say a certain space covered by one roof is a house, for there are structures of that kind, such as blocks of offices and flats, which may contain a large number of houses. As good a test as any would be the fees received by the district surveyor. The question can arise in connection with very simple houses. An injunction was applied for a few days ago, before Mr. Justice SWINFEN EADY, which related to a class of house which could be erected for 300*l*. The company owning land called the Ilford Park Estate granted a conveyance of three plots. Not more than one house was to be erected on each of them, and the elevation was to be

approved by the company's surveyor. The design sent in by the defendant was not approved, and the injunction sought was to prevent the erection of such a building as was represented. It was alleged that the defendant was endeavouring to erect two houses on each plot instead of one. The planning was certainly ingenious. As his Lordship said, there was no internal communication between the ground floor and the first floor; there was no common staircase, as the ground floor did not require a staircase; and there was no common front door, but separate front doors for each of the two tenements. In order to pass from one house to another it was necessary to go out of the front door of one tenement to a space which opened upon the street, and to enter the front door of the other. There was no question here of one house being built and being intended to be used as two. In substance there were here two houses structurally separated in every respect, with separate doorways into the street and with no internal communication. It was different from the case where a building was erected and intended to be used for flats. In that case there was internal communication. Here there was none. His Lordship came to the conclusion that what was intended by the defendant was merely one house superposed upon another, and each building therefore constituted two separate houses. The injunction followed.

THE managers of the Poplar and Stepney Asylum lately applied to the London County Council to allow one of the members of the Fire Brigade to advise them, as a large expenditure was about to be incurred in devising means of protection against fire. The Council have prudently declined. Their responsibilities are too numerous without voluntarily accepting an addition to them. There are enough architects and engineers who would be competent to give the advice desired. The application, however, is evidence of the uncertainty prevailing on the subject. Seemingly it has not got into the public mind that architects and engineers are sufficiently competent to deal with the subject. In the United States the gravity of having instruction is recognised by the provision of courses in fire-protection engineering in the Armour Institute of Technology, Chicago. The new section will be in charge of Professor FITZ HUGH TAYLOR, formerly engineer to the Underwriters' Laboratories. The course will be one of four years. The special instruction seems to be three hours a week during the second year in the chemistry of fire protection, eight hours during the third and fourth years in fire-protection engineering and eight hours during the autumn and winter terms of the fourth year in scheduling, special hazards, underwriters' requirements and insurance practice.

IF the late JULES SIMON is cognisant of what takes place in this lower world, he would probably say that his good-humoured philosophy was doomed to further trials. In the course of his chequered career, for he was a poor teacher and a journalist before he became Prime Minister of France, and in his closing years he continued to live by his pen, he met with many crosses which he bore as if he did not feel their weight. His admirers thought they would make compensation for former neglect by erecting a statue in the square of the Madeleine near the house in which he lived at the topmost storey. But for two years the pedestal has been awaiting its burden. It is now announced that the statue will be revealed to the public on July 12. One of the reasons for the delay has been that beneath the square there are several cellars, and precautions had to be taken to prevent a collapse of the arches. As the memorial of King WILLIAM IV. in the City of London was an obstacle to the progress of the works on the District Railway, we can understand why a bronze statue and pedestal should excite some alarm about the ability of the pavement in a retired part of Paris to support the weight.

ST. JAMES'S COURT: DETAIL OF ONE ENTRANCE.

ST. MICHAEL'S COLLEGE, TENBURY.

By J. S. BUMPUS.

TENBURY, a quiet little market-town of 1,730 inhabitants, is pleasantly situated on the banks of the Teme, in the extreme north-west corner of Worcestershire, the river dividing that county from Shropshire just at that point.

Cyclists and pedestrians, fond of a beautiful and comparatively unexplored country, would do well to make Tenbury their headquarters for a few days. The Swan, an excellent hostelry, replete with comfort, stands picturesquely at the foot of the Teme bridge.

A mineral spring was discovered here in 1839, by workmen sinking a well. The water sprang up suddenly from a bed of limestone, lying under a massive stratum of old red sandstone 32 feet below the surface. It contains chloride of calcium (calc), of sodium (soda), magnesium and bromine, with a trace of iodine. "Horrid stuff," we have heard it designated. Nevertheless, it has proved highly beneficial in scorbutic, cutaneous and rheumatic disorders. There are a pump-room and baths, and walks laid out on the bank of the small river Kyre (a tributary of the Teme), forming a spa.

Of the parish church of St. Mary, the tower and chancel are the only parts of the ancient church erected in the eleventh century. The nave was destroyed in November 1770 by the overflowing of the Teme, which surrounds the churchyard. This injury was occasioned by digging a grave near the foot of a pillar supporting the roof, between the nave and south aisle, when the water, percolating through, undermined the column and threw down that portion of the building. Careful restorations were carried out by the late Mr. Henry Woodyer some years ago, but it is hard to think he could have sanctioned such an atrocity as the beetling western gallery. The chancel and sanctuary are well appointed and cared for, and there is daily prayer. The church contains some monuments of interest, one of which is ascribed to Sir John Sturme, who joined the Crusades under Richard I. The town boasts several picturesque houses, and a red brick "butter cross" of striking originality. The Teme is famed for its trout and grayling fishing, and in the season there is much attraction for the disciples of Izaak Walton. From Tenbury, Ludlow, with its romantic environs, ruined castle and noble parish church; Leominster with its Norman priory church, and Hereford with its cathedral may easily be visited. The county round is studded with village churches, which, if not exactly grandiose

ST. MICHAEL'S, TENBURY, WEST FRONT OF THE CHURCH.

are full, many of them, of interesting detail, and well merit examination by the student of ecclesiology—especially Burford and Little Hereford.

But the main attraction at Tenbury, and the spot with which the place seems to be now inseparably associated, is the beautiful church and group of buildings known as St. Michael's College, founded by the Rev. Sir Frederick A. Gore Ouseley in 1856. The church, of which he was the first vicar, was erected at his own expense. The college, of which he was the first Warden, and partially endowed by him, was intended, not only as a means of promoting the choral service of the Church, but also to give, at a moderate cost, a liberal and classical education to the sons of clergymen and gentlemen of moderate means, combined with sound Church teaching and the maintenance of a daily choral service of the highest devotional type.

The comparative isolation of this interesting foundation has, we fear, caused it to be left unvisited by many who would otherwise gladly avail themselves of the privilege. The distance from London is certainly great, but the journey is very easy. The 9.50 A.M. train from Paddington is a good one. It runs to Oxford without a stop, and even as far as Worcester is fairly fast. By getting into a through carriage for Kidderminster all change, as far as that place, may be avoided. Here a train departs for Tenbury, Woofferton and Hereford branch soon after the arrival of the London one. Returning, it is a good plan to take the midday train from Tenbury to Birmingham. From the latter place, a fast train leaves for London at 2.40, stopping only at Leamington. The scenery on the Tenbury branch is highly novel and interesting. At Bewdley there are delightful peeps of the Severn, and as far as Cleobury Mortimer the rail threads the Wyre Forest, a district of 7,000 acres planted with ash and underwood. It seems that a periodical fallage has been adopted from very early times; hence the complaint of Drayton in his "Polyolbion"—

When soone the goodlie Wyre, that wonted was so hie
Her statelie top to reare, ashamed to behold
Her straight and goodlie woods unto the furnace sold;
And looking on herself, by her decay doth see
The miserie wherein her sister forests bee.

Arrived at the quiet little station of Tenbury, it is a walk of two good miles up to the college. Conveyances may be chartered at the Swan, but a guest at St. Michael's, not overburdened with impedimenta, will find this walk (supposing he has arrived on a fine, bright afternoon in early September) a delightful one.

Leaving the town behind us, the road (which is the high one to Leominster) ascends gently for a considerable distance. Orchards, hop-gardens, cornfields and rich pasturelands meet the eye on all sides. Charming peeps of the distant scenery present themselves at various points, and an occasional black-and-white timbered house, a local feature, stands out picturesquely against the deep blue sky and green foliage, still in all its summer freshness. At length we arrive on the rough, open, breezy Old Wood Common. In the distance, to the north, are the great Titterstone Cleve and the Ludlow Vinhalls, while on the other side are the lovely scenery and peaceful quiet of a typical Worcestershire parish, embosomed in the richest foliage. At the termination of the Common we see, on our right, St. Michael's Vicarage, the residence of the Warden, the Rev. John Hampton, separated from the road by a hedge and surrounded by one of the most charming gardens imaginable, all "very snug and parsonic," as Sydney Smith would have said. Another minute's walk brings us to the college.

In his "Life of Sir Frederick Ouseley" *—one of the most able pieces of ecclesiastical biography produced in modern times—the Rev. F. W. Joyce remarks that "had St. Michael's been built near some large town with all the advantages of railway accommodation, it is quite likely that the school, at all events, might have more materially prospered. But," he continues, "one thing is very certain, and that is the whole place would have lost one of its chief charms, and that which no man more thoroughly appreciated than its founder from the beginning to the end of his work, viz. the simplicity of its rural surroundings." And, again, "There, before your eyes, as you pass through this scene of primitive English life springs, as it were, out of the very ground, a lofty church with a noble

pile of buildings by its side." St. Michael's was characterised by a writer in the *St. Stephen's Review* of October 1883, as "the one real development of the æsthetic principle that England is yet able to boast . . . emphatically one of the loveliest architectural efforts of the century—the *chef-d'œuvre* of an architect pre-eminently capable of grasping the spirit of the Middle Ages." This description may be somewhat overdrawn, but few could pass St. Michael's for the first time, springing up suddenly as it does in this sequestered spot, without surprise and admiration.

Pausing awhile at the college gates, it may be well to sum up briefly the history of the foundation of the college. Sir Frederick Ouseley in 1849 took deacon's orders, and was licensed to the curacy of St. Paul's, Knightsbridge, under the Rev. W. J. E. Bennett (*clarum et venerabile nomen*). When, in the following year, St. Barnabas, Pimlico, was consecrated as a chapelry to St. Paul's, Sir Frederick principally served that church, his fellow curates being the Revs. Henry Fyffe and G. F. de Gex. The success of Mr. Bennett's work at St. Paul's, Knightsbridge, to which St. Barnabas stood in the relation of a chapel of ease, the *éclat* of the consecration of St. Barnabas itself, the novelty of its construction with collegiate buildings for clergy and choir, its multiplied services, the free and open access to the church for rich and poor alike, the beauty of the architecture and the dignity of the ritual, combined to make it an object of wide attraction. All this, however, was not done without opposition and dislike on the part of the Puritan section in the Church. The year 1850 was a memorable one in the annals of the English Church; indeed, it was a time of intense politico-religious excitement in the whole country. It was a year in which the Prime Minister, himself, heretofore, the leading champion of religious toleration, thought fit to dictate to the bishops of the land what should be their course in the government of the Church; and thereby, in exciting the passions of the multitude, provoked a scene of strife and controversy, the end of which he was unable himself to foresee.* Bishop Blomfield's "histrionic" charge had been delivered in St. Paul's Cathedral, and, to crown all, the Pope had parcelled out England into dioceses. No wonder, then, that the popular mind was exercised, and in November, 1850, five months after the consecration of St. Barnabas, there ensued, for a long series of Sundays, riots at that church unparalleled only by those at St. George's-in-the-East ten years later. Indeed, had it not been for the determined attitude of the congregation and the intrepidity of the officiating clergy, the right to undisturbed worship would have been entirely set aside and the beautiful church wrecked by a misled and ignorant mob. Affairs culminated in the resignation of Mr. Bennett† and the assistant clergy. During the tenure of his curacy at St. Barnabas, Sir Frederick Ouseley generously bore the whole expense of the choral services, which were celebrated (Sundays and weekdays alike) in a stalled and richly-appointed chancel, and in the full cathedral manner. When the break up came, the chorister-boys who had been educated and boarded in the adjacent collegiate buildings, were sent under the charge of the Rev. Henry Fyffe to Lovehill House, Langley Marish, a few miles from London on the Great Western Railway, and in order that the traditions of St. Barnabas might not be broken, a private chapel was attached to the house in which choral service was held twice daily until Michaelmas, 1856, when Ouseley's scheme culminated in the erection of St. Michael's.

From 1851 to 1852 Ouseley travelled abroad, and, on his return in June of the latter year, bought some ground on a high tableland adjoining the Old Wood Common previously noticed. He had made his acquaintance with the neighbourhood some years before, through the frequent visits he paid to his old friend and tutor, the Rev. J. Wayland Joyce at Burford Rectory. Before the end of 1852 he had fixed on the site, not only for the church, but also for the college. Throughout 1853

* See Lord John Russell's famous "Durham Letter."

† In 1852 Mr. Bennett accepted the living of Frome Selwood, in Somersetshire, which he held until his death, in 1886, at the age of eighty-four. The restoration and rebuilding of the church of St. John Baptist will ever be a memorial of him, and the services and work of the parish were in accord with the splendid church known far and wide for costly magnificence; on it he had expended his own private fortune.

the plans were being prepared by the architect, Mr. Henry Woodyer, of Guildford,* and on May 3, 1854, the foundation-stone of the church was laid. A little more than two years later, viz. on Monday, September 29, 1856, the Feast of St. Michael and All Angels, the church and buildings were consecrated with a magnificent ceremonial by Dr. Hampden, the Bishop of Hereford, who had all along been most kind and cordial, and who approved of the scheme in every way. He assigned a parochial district, which included portions of the parishes of Leysters, Tenbury and Middleton-on-the-Hill. By the then vicar of Tenbury (Rev. John Churton) Ouseley was considered as a "Puseyite." Events at St. Barnabas were fresh in the minds of many.

Sir Frederick Ouseley dearly loved his picturesque estate—and well he might—so tranquil and so beautiful, and with such a rich, smiling country spread around it. To stay for a few days at this place is a distinct privilege, and going back to town and business is like entering another world.

On entering the college gates one cannot fail to take note of the "hallowed acre" surrounding the church on its northern and eastern sides, and the scrupulously neat manner in which the turf and graves are kept and tended. No hideous urns or meaningless piles of Euston Road cemetery masonry offend the eye. All is in good taste; several of the stones being of the coped form, as approved by the Ecclesiological Society in the *Instrumenta Ecclesiastica*. The graves of the poor are marked by small fleuriated crosses of iron with brief inscriptions. Thus the turf is not disfigured by heaps of nameless mounds. Beneath the east window of the church we observe the tomb of the founder, whose sudden death, on April 6, 1889, caused such profound regret. It consists of a block of polished red granite, on which lies a cross of white marble, supported at the ends by four small pillars cut out of the granite. It was subscribed for by fifty of Ouseley's friends, and the design was furnished by Mr. Aston Webb.

(To be continued.)

HOLMBURY ST. MARY.†

UPON the present occasion I have endeavoured to provide a ramble rather in accordance with the intentions of the Society when first established, than one possessing any very archaeological or architectural features. My meaning is, that the Council having been kind enough to appoint me a long summer day, I have tried to utilise it by arranging somewhat of a picnic, which, having been held in some of the most beautiful parts of our home county, and within easy reach, may send us all home refreshed after the week's work.

Nevertheless, I have consulted, I think, all the records available in order to make my paper interesting and instructive, as well as our walk agreeable.

I have not been able, after considerable research, to establish definitely whether the camp which we have seen this afternoon is of Roman origin or not, but I propose to give you the result of my investigations.

From a very early authority I learn on the confines of Shire, Ewhurst, Abinger and Ockley (on the common called the Churt or East Churt), and on a considerable eminence which shoots out between Leith Hill and Conyhurst Hill, is a large camp called Holmbury. It is situated on the eastern declivity near the top of the hill to which it gives its name, and toward the southern extremity of it.

It is a work of an extremely irregular form, having an entrance near the north-west angle and another near the south-east, and is fortified with a double trench, except on the east, south and south-west, where the precipice rendered it unnecessary, and where, therefore, it has only a single one.

The area within is 8 acres 2 roods 13 perches; it is supposed to be of Roman construction. It is about two miles from the Stane Street Road, and about as far in a straight line west of the camp called Anstie.

Aubrey, in his "Natural History and Antiquities of Surrey," 1718, says:—"Within this parish is a mountain called Holmbury Hill, near to which (adjoining to the road from Dorking to Arundel) is a very great camp, double trenched and deep, containing by estimation about 10 acres at the least. The

inhabitants hereabout have no name for it. From this camp is a noble prospect over the wyld to Kent and Sussex, and quite over Sussex (in a clear day) to the sea; as also to Hindhead (a hill in Hampshire). Contiguous to this hill is Boare Hill, where the tradition is that heretofore were wild boars; and Hether Hill, denominated (they say) from a yeoman family of that name, which hath continued in this parish from before the Conquest, and are still here. Full east from this camp, in the wyld, is a large pond called Eaglewood Pond, in the parish of Newdigate, of about twenty or thirty acres. From Dorking to North-down Hills in Sussex is a large prospect of several miles off, over a spacious vale, very broad, full of enclosed pastures; the fore-shortening of the prospect makes it like a wood."

Brayley, in his "Topographical History of Surrey," says:—"In the Saxon Chronicle occurs a notice of a battle which took place at Aclea, in which the Danes, who had invaded England, were defeated by the Saxons, under their king, Ethelwulf, in 851."

Leland, in his "Collectanea," mentions the victory over the Danes as having happened at Okeley, and it has been generally admitted that Ockley, in Surrey, was the scene of that conflict.

On Holmbury Hill, in this parish, is an ancient camp of an oblong form, but with a considerable angular projection at one end; at the opposite extremity are distinct remains of a double ditch and vallum, which are continued along the side that was distinguished by the main entrance.

It is probable that this was the position occupied by the invading host. Aubrey states that "the mote and mob of the keepe of a castle, indifferent large," were remaining in his time near the church.

H. E. Malden, in his "History of Surrey," says:—"This exactly bears out the idea of a camp of refuge fortified by banks, ditches and abattis." (Cæsar: "De Bello Gallico.")

Holmbury and Hascombe both show traces of Roman science. They are rectangular on three sides, only in each case the south side, crowning a steep slope, follows the contour of the hill.

Just as the later Roman engineers sometimes adopted the style of fortification of the barbarians who filled their armies, so barbarians who had seen Roman warfare copied the Roman science. Apparently some late Roman and some barbarian camps are indistinguishable in form. But these fortifications perched upon the tops of hills, away from water, are quite unlike the works of the Legions. Such works, perhaps, belong to the time when the Romans had departed, and when the Welsh of Surrey were alarmed by the progress of English invaders from the north, east and west. Few, if any, of these camps have been systematically explored for remains, but they have yielded a few coins and flints.

The age of a fortification is not to be decisively determined by the remains found in it. For instance, in an undoubted British camp near the South Downs, the first investigations of an eminent antiquary led to the discovery of two old-fashioned tobacco pipes and a halfpenny of King William III.

Many of them may have been occupied by different people at different times, long after the first builder had disappeared. Three of the most considerable Surrey camps, St. George's Hill, Anstiebury and Hascombe, are completely overgrown by woods. As Surrey was not the scene of Roman warfare after, perhaps, the first year of the invasion under Claudius, Roman military remains are few. There was apparently a *tête du pont* covering the foot of London Bridge. But its existence is rather a matter of conjectural probability than evidence. There is a rectangular, or nearly rectangular, camp on Puttenham Heath, south of the Hog's Back, called Hillbury, which with a single bank and ditch close to a stream which is within missile reach of the western vallum has all the appearance of Roman work.

(The Hillbury camp is not exactly rectangular; the north side is shorter than the south. But Roman engineers did not always observe the rules of Polybius or Hyginus exactly.)

It is a very possible halting-place of a detachment of Vespasian's army. There are three small square enclosures on Walton Heath. There is a very small square camp near the Mole, above Stoke d'Abernon, near Randall's Park, and there used to be three small square works near Chertsey, nearly opposite Laleham. On Farley Heath, near Albury, is a large nearly rectangular fortification, with remains of brick buildings, which is clearly a Roman station. It was a camp, possibly, converted into a permanent settlement or garrison. A systematic excavation of it would probably yield very interesting results, for a great quantity of coins have been found there by merely random digging.

We may picture Roman Surrey to ourselves as a pleasant rural country, ungarrisoned, secure from enemies, during the greater part of the Imperial rule. The Legions were quartered far away in the north and the west. Neither was Surrey a great centre of trade or population. The towns must have been few and small. In what is now Southwark there were villas with tessellated pavement and other marks of wealthy inhabitants. Sufficient remains have been discovered at

* Woodyer was a pupil of the late William Butterfield. Specimens of his work may be seen in the exquisite groups of buildings and chapels of the Convalescent Home, Eastbourne, and the House of Mercy at Clewer; in the Church of the Holy Innocents, Highnam, near Gloucester; and in the restoration (1873) of the church of St. Helen, Abingdon.

† A paper read by Mr. T. H. Alexander before the members of the Upper Norwood Athenæum.

Kingston-on-Thames to lead us to suppose that there was a small town. The Thames valley was no doubt as attractive to a Roman, or Romanised Briton, as to ourselves.

Albury—in Domesday, Eldeberrie, the Old Bury—was named apparently from these ruins. In Aubrey's time the remains of buildings were evidently much more considerable here. The bases of two of the pillars of old Albury Church have been thought, perhaps wrongly, to be Roman, taken from this place. At Woodcote, near Croydon, there used, according to Camden and Aubrey, to be very extensive remains. There was the small town on Farley Heath.

It is impossible to say from remains, or from the names in the Itineraries, that there were any other towns.

High up on Walton Heath, between Reigate and Epsom, there are remains of a few Roman houses, and a brass image of Æsculapius has been found there. One wonders what took a fairly rich man to such a spot, unless he wished to test the speed of his British horses over the turf made famous by subsequent struggles.

Near Gatton various Roman relics have been found, including parts of the ornamental trappings of horses. At Pendill, in Bletchingley, a Roman hypocaust and foundations were discovered in 1813. A Roman villa was discovered at Pitsey, near the Pilgrims' Way, in 1864. There was another near Guildford, another near Chiddingfold, and remains, in Stukeley's time, at Tongham. At Abinger there was a small Roman villa, pleasantly situated, with a hill between it and the north, standing among the sandy heaths, and close to the great forest. It was the hunting-box, perhaps, of an official from London. It is in the grounds belonging to Lord Farrer. The remains here have well-nigh disappeared now—not without fame in their decay. It was here that the late Charles Darwin scientifically observed and recorded the ravages of the earthworms upon the exposed and once admired tesserae of the atrium.

HOLMBURY CHURCH.

Roman Surrey, without a name of its own, was merely an agricultural, residential and sporting district then as now. But the neighbourhood of the Anderida Silva, where the boar, the red deer and the wolf haroured, must have afforded more stirring sport than can be obtained with the Royal Buckhounds, the Surrey Union or round the pheasant preserves. On the chalk downs the bustards wandered in troops; on the heaths the still not extinct blackcock mocked the skill of the archer. In the streams the otter fished as he still fishes, and perhaps the beaver engineered. It must have been a pleasant place when the north-east wind brought up no cloud of smoke from London, when nature had still as a rule the upper hand of man, and when from the brow of Leith Hill the hunter could gaze over an unbroken sea of oak boughs tossing between him and the distant South Downs.

In conclusion, Capt. E. James, R.E., who some time since commanded the Ordnance district in which the line of country between Sand Hills and Farley is situated, wrote to Mr. J. P. Harrison, who contributed a paper on the subject of Roman roads to the Surrey Archaeological Society:—"The Weald of Sussex was the Andred's Weald, and (with the adjoining clay district in Surrey) was probably never thoroughly settled by the Romans. It remained forest, and was occupied by the aboriginal inhabitants. The Romans having advanced by the Thames occupied with their outposts the line of old British works, facing southwards, on the sandstone hills, overlooking the Weald. The works were probably Crooksbury, Hillbury (Puttenham), Hascombe, Chinthurst (called also Somersbury) (Wonersh), Holmsbury, Leith Hill and Anstiebury. On the south of the Weald the Romans had established colonies at

Chichester, Arundel, Shoreham, &c., and occupied the northern end of the South Downs with their outposts."

Thus, although we cannot decisively ascertain the origin of these earthworks, so lost is it in the obscurity of the past, yet there stand the "everlasting hills" with these records of what our ancestors have done clearly delineated upon them, notwithstanding the ages which have since past; and they still afford objects of interest for our study and provide food for our imagination, whether we picture to ourselves the "aboriginal inhabitants," stained with woad, working upon them, or the stalwart figures of the Roman soldiers.

The following notes were kindly furnished by the Rev. A. C. Hayes, rector of Holmbury:—

The church of St. Mary the Virgin, Holmbury St. Mary.—The church was designed and given to the newly-formed district parish by the late George Edmund Street, R.A., and was consecrated on November 6, 1879. It is in the Early English style. The walls are built of Holmbury Hill stone (Hythe beds), and the dressings of windows and doors are of Bath stone. The rapid slope of the site enabled the vestries, by a slight raising of the north aisle, to be placed under the church. Over the western bay of the nave rises a bell-turret with shingled spire. It contained originally five bells arranged for chiming, and cast by the eminent organ-builder, Mr. Lewis, with religious inscriptions after the old fashion, instead of the modern custom of giving the names of the maker and churchwardens. A sixth bell was added in June 1887, when a chiming clock made by Messrs. Gillett, of Croydon, was presented by the parishioners, in celebration of the fiftieth year of the reign of Her Majesty Queen Victoria. The following inscriptions on the five bells were composed by Mr. Arthur Edmund Street, the founder's son:—

- (1) Patrem nostrum celebramus.
- (2) Christum Filium salutamus.
- (3) Sanctum Spiritum laudamus.
- (4) Caros mortuos ploramus.
- (5) Vivos ad preces vocamus.

And may be roughly translated:—

- (1) The Eternal Father's Name we praise.
- (2) Salute we Christ the Son.
- (3) To laud the Holy Ghost we raise
Our voices clear and strong.
- (4) The dear departed lady we deplore.
- (5) The living call to worship and adore.

The points in the exterior of the church that chiefly call for notice are the considerable height of the east end, and the recessed and canopied tomb of the founder's wife in the south wall of the church. Entering the nave through the western screen, the arches on each side are carried on pillars of blue Pennant stone, with smaller shafts of Belgian marble. The reredos is of Purbeck marble, and in the centre is a fourteenth-century triptych—the Blessed Virgin and the Infant Saviour surrounded by saints and angels—attributed to Spirello Aretino. The altar cross is of old Limoges enamel, dating probably from the twelfth century. The altar cloths and banner were works by the sisters of St. Margaret's, East Grinstead, and the dossal and sedilia hangings by ladies in the parish.

The stained-glass windows were all executed by Messrs. Clayton & Bell, from Mr. Street's designs. In the east window he has introduced the kneeling figures of his patron saints, St. George and the Martyr King St. Edmund, and in a small window over the west door are his arms, with the motto of his family, "Fidelis inter perfidos." His crest, a St. Catherine's wheel, will also be noticed in the pattern border of the side windows in the chancel, as well as in the church banner. Under the west window is a beautiful old terra-cotta of the Blessed Virgin and Child, by Lucca della Robbia, given to the church by Mr. J. P. Clayton. The organ was built by Messrs. Lewis. The handsome oak lych gate at the entrance to the churchyard was erected by the late Sir William Dowman, Bart., of Toldwynds, in the parish of Holmbury St. Mary. The churchyard cross, designed by Mr. A. E. Street, was erected by the parishioners and others in grateful and loving memory of the great architect, who, surviving the consecration of the church little more than two years, was laid to rest in the abbey of Westminster, December 29, 1881.

Round the base of the cross is the text, Psalm cxxii. 4-5:—"I will not suffer mine eyes to sleep," &c.

The illustration of St. Mary the Virgin, Holmbury, is from a photograph by Mr. Henry Virgoe.

The Bishop of London consecrated on Tuesday the church of St. Cyprian, Marylebone. The total cost of the new building will be about 13,000*l.* of which 3,000*l.* is still required. The architect is Mr. J. N. Comper, and the interior of the church is an example of fifteenth-century architecture. The church will seat 600 persons. The interior is of Bath stone, the roof being of pine with fibrous plaster panels.

VALUATION OF CHRIST'S HOSPITAL.

ON Thursday in last week at the West Sussex Quarter Sessions the appeal of the Council of Almoners of Christ's Hospital against the assessment committee of the Horsham Union, in respect to two poor rates, was heard before his Honour Judge Lumley Smith and other magistrates.

Mr. Bray, K.C., for the appellants, in his opening explained, says the *Sussex Daily News*, that the two districts concerned were Horsham Rural and Itchingfield. In regard to Horsham Rural the sum was 14,745*l.* gross and 11,150*l.* net, while in respect of Itchingfield the sum was 450*l.* gross and 350*l.* net. Christ's Hospital was a charity and was not founded on a commercial basis in any way. It was only children of parents who could not afford to pay for education who were educated in this school, and the highest payment of money that could be made under the scheme was 20*l.* In a great many cases there were no fees at all; essentially it was a charitable institution. The actual cost per boy was something under 60*l.* per year. The buildings were to a great extent obviously of an ornamental and monumental nature. It was a very old-established institution, and not unnaturally the Council of Almoners were of opinion that it was an opportunity to erect something which could be a monument for ever to the founders of the hospital. In consequence buildings had been erected on what some people might call an extravagant basis, certainly an extravagant basis if anything in the commercial line had been intended. The Court had to consider what would be the rent which could reasonably be obtained from a yearly tenant. Of course, there was no tenant or competing body. The schools probably contained more accommodation for boys than any other school in the kingdom, greater than Eton, Harrow, Winchester, or other schools. He explained that a valuation was made by the overseers, who included Mr. S. Smith, a valuer, at Horsham. They put the gross rateable value at a little over 11,000*l.*, and the net rateable value at 8,817*l.* The Council of Almoners, thinking that this was excessive, objected. The assessment committee called in Mr. Ryde, who raised the figures from 8,817*l.* to 11,150*l.* Taking it at about 6*l.* per boy, the rateable value would work out roughly at some 6,000*l.* Mr. Ryde took 3 per cent. upon the actual cost of the buildings. The Council of Almoners complained that he had assessed the school in one lump sum, and no details were given. In the Oxford case it was held that they must disregard everything of an ornamental or monumental character; in fact, they must take what was described as the utility value of the buildings. Three per cent. ought to be applied if they were to take it on the structural value.

In reply to Mr. Boxall, K.C., for the respondents, his Honour said they were not going to view the buildings, because most of the justices were conversant with them.

Mr. Bray next compared Mr. Ryde's assessment of the various buildings with that of the overseers. Mr. Hedley, who was called in by the Almoners, assessed the buildings from the point of view of their utilitarian value, looking upon them as of quite unnecessary size.

His Honour: He does not cube all the buildings.

Mr. Bray: No, he takes another building that will do as well. This was done to a great extent in the Oxford case.

Mr. Hedley was then called. He stated that he had nearly twenty-five years' experience in valuing large works, hospitals, infirmaries, asylums and schools. He gave evidence bearing out points in the opening, submitting that 6*l.* per boy was a fair value for this description of building.

In cross-examination by Mr. Boxall witness contended that many of the buildings were too high for the length and breadth. Lower buildings would have been sufficient to accommodate the boys. For the dining-hall the height was 56 feet, and he had deducted 30 feet.

His Honour: He has valued the lower half and not the upper half.

Witness said the roof was very expensive, being handsomely decorated. He described the water tower, the most costly work of the buildings. This was of no value, and he had taken it off. In regard to the dormitories the accommodation was enormous, the floor space being too large, and they were too lofty. He had never seen such accommodation. Good accommodation could have been provided at much less expense. He had taken a third off here and also in the preparatory school. The infirmary was one of the finest in the country, far in excess of any requirements in a place like that. "I wonder," he added, "whether you could get anybody to pay a rate for an infirmary based upon the capital of this place." In the sanatorium there was too much accommodation, too many bedrooms for infectious disorders. A half would have been sufficient. The five courts were too large.

Re-examined: Over other schools he had never seen buildings so large as those for the accommodation.

His Honour: You have gone on the principle of taking the costs on percentage of value?—Witness: Yes.

His Honour: Then your view is that the place is unnecessarily large and unnecessarily ornamental, and you have

reduced the dimensions of the place to what you think sufficient Witness: I have.

His Honour: Then you reduced it to a style of building you think good enough for the purpose and valued that?—Witness: Yes.

His Honour: The result is you have not valued the building now assessed, but what you think would be good enough for the Almoners to build had they been humble-minded gentlemen to erect buildings for this purpose?—Witness: Yes.

Mr. Bray: Is this a common thing?—Witness: Yes, to take the utility value.

The Judge: Utility valuing is right.

Mr. Alexander A. Stenning, of thirty-five years' experience, said the buildings were constructed upon a too liberal plan for the purpose of letting or utilisation, and he had deducted 25 per cent. He estimated 5*l.* 7*s.* per head, and this was rather above the average. He did not think any public institution was rated up to this.

In reply to Mr. Boxall, witness said he was surveyor to Christ's Hospital, and was designing a new building at the schools in Hertfordshire. He was not architect for the schools at Horsham. A great deal had been spent on the buildings, which were not rateable. The chapel and dining-hall were far too costly. The master's house was very costly—3,200*l.* for accommodation which they would not let for more than 60*l.* net.

Mr. Boxall: Was it suited for the purpose?—Witness: I think not; there is not the accommodation.

Mr. Boxall: Then this is too small?—Witness: It ought to be differently arranged. Personally, I don't approve of the plan, and could have built better houses than that. He added that there was an excess in every department, and parts were lavishly done.

While the witness was being questioned in regard to the cubic feet, his Honour caused some amusement by asking how many cubic feet were the boys to have in the playground.

Mr. William Lempriere, who was educated at Christ's Hospital, and is at present senior assistant clerk at the schools, gave some interesting figures in regard to the hospital buildings. He stated that accommodation was provided for 820 boys, and at the present time there were 747. The site of the schools was purchased from the Aylesbury Dairy Company, and 53,000*l.* was the price of the original purchase. Afterwards other property was purchased for 100*l.* and 1,225*l.*, making a total acreage of 1,167. The contract price for subways and foundations was 23,207*l.*; fees to architects, surveyors, clerk of works and law charges, 29,000*l.*; pipes and outfall, 5,228*l.*; road making, asphalted paths, tree planting, laying-out and levelling, 34,274*l.*; well, 2,131*l.*; reservoir and machinery, 13,027*l.*; furniture and equipment and laying of foundation-stone, 12,491*l.*; electric supply, 11,385*l.*; contracts for the buildings, 383,471*l.*; total, 566,500*l.*

Mr. Bray: Do you find your own police?—Witness: Yes. He added that they acted subject to the approval of the Charity Commissioners. The erection of old portions of Christ's Hospital was exceedingly expensive—about six times as much as if new portions were erected. About 150,000*l.* more was spent than anticipated.

Mr. James Green (Messrs. Wetherall & Green), consulting surveyor to the Treasury, War Office and Board of Trade, acting for the London County Council, and chairman of the assessment committee for the borough of Kensington, was also called. He had assessed Charterhouse, King's College Hospital, King's College, and was also concerned in the new colleges for Oxford University. He based his estimate on the same lines as Mr. Stenning, and, in giving particulars, remarked, in regard to the infirmary, that this was a very extravagant building—one that was carried out to the doctors' fads. He had deducted 50 per cent. of the cost. He assessed the rateable value 5,903*l.* and the gross 7,870*l.*

This was the case for the appellants, and Mr. Boxall, on behalf of the respondents, submitted that they desired to deal with the assessment in a reasonable spirit, being well aware that it was a large charitable undertaking, and that there was a very great expenditure of capital on what must stand by annual value at very high rent. They desired to avoid all litigation. He contended that in the evidence of the witnesses who had been called the cost of construction had been entirely left out of their calculations. He drew attention to the fact that the Council of Almoners acted with the approval of the Charity Commissioners, and ridiculed the suggestion put forward that there had been an extravagant expenditure of a quarter of a million. He submitted that the money had been judiciously expended. They might have expended more than they anticipated, but anyone who saw the appropriateness of every bit of the buildings and their usefulness could not say that there was injudicious expenditure as alleged.

Mr. A. L. Ryde (Messrs. Ryde & Sons), Westminster, of twenty-five years' experience, was then called, and, alluding to the suggestion of waste, said he had seen Mr. Aston Webb and had come to the conclusion that there was no extravagant

expenditure. If 30 feet were taken off the dining-hall Mr. Aston Webb would be horrified, because the building would be ill-proportioned. The buildings were well-proportioned and the architecture was very plain, except here and there, where it broke out in stone relief. He gave detailed particulars of how he arrived at his valuation, and was being cross-examined by Mr. Bray when the Court rose.

The further hearing of the appeal will take place on Saturday, July 4.

A NEW PORTRAIT OF SHAKESPEARE.

IN a letter to the *Standard* Mr. C. L. Eastlake writes:—The publication of a booklet under this title, by Mr. John Corbin, an American author, has revived a question on which a few years ago much controversy took place, viz. as to whether the portrait presented to the Shakespeare Memorial Museum at Stratford-on-Avon by Mr. Edgar Flower is from life, and the original picture from which Martin Droeshout executed his well-known engraving prefixed to the first folio edition of Shakespeare's plays. A recent visit to Stratford has enabled me to examine the picture carefully, and, without pretending to more than ordinary experience in such matters, I venture to think that a solution of this problem is less likely to be attained by the aid of antiquarian research than by the light of common sense. If it is part of Mr. Corbin's theory to suggest that the engraving was based on what is known as the "Ely Palace Portrait" (now in the Shakespeare Birthplace Museum) I fear that I cannot agree with him. That picture, in its original state, may or may not have been a contemporary likeness, but its relation to the engraving is extremely doubtful.

In declining to believe that the so-called Droeshout picture was the original of the print, Mr. Corbin is on safer ground. The issue in this case is a very narrow one. There is so much resemblance in detail between the two that we must choose whether the print is to be regarded as a copy from the picture or the picture from the print. I have come, almost regretfully, to the latter conclusion, and for the following reasons:—

In the first place, bust-length portraits at the period to which this picture is assigned were, as a rule, somewhat smaller than life. The so-called Droeshout picture is larger. Anyone who takes the trouble to measure Elizabethan or Jacobean portraits in our National Collection will find that they average 8½ inches in length from the top of the head to the underside of the chin. But the head in the "Droeshout" measures quite 10 inches. This is an abnormal length in portraits of the alleged date (1609), but is not inconsistent with the character of some works executed at a later period.

Secondly, the head in the print is slightly inclined on one side, so that the right eyebrow is rather higher than the left and the lobe of the left ear is sloped. In the painted picture the eyebrows are on precisely the same level. The head is as perpendicular in pose as if its axis had been defined by a plumb-line. Now, this is just such an alteration as a late painter might have designedly made in copying from the print, but hardly one on which an engraver would have dared to venture in reproducing a portrait.

Thirdly, the print clearly indicates, with actual lines, the stubble of a beard on the chin and lower part of the face. In the picture the corresponding portions are as smooth as a billiard-ball. What engraver would take the trouble to improvise and introduce such additional minutiae? On the other hand, it is more than likely that a clumsy painter translating a print into an oil-picture would shirk the trouble of representing in detail the appearance of an unshaven chin.

Again, there is considerable difference between the print and the picture in the delineation of a braided ornament which runs down the front of the doublet on each side of its buttons. In the picture it is a chain-like pattern, each link of which is identical in size and symmetrically disposed. But in the engraving the same ornament is most irregularly drawn—in fact, hardly recognisable as a chain pattern at all. Now, this is a detail which an engraver could have reproduced with mechanical accuracy, if he had chosen to do so, when copying the picture. But it is not so rendered, and the inference is obvious. That the so-called Droeshout picture, if ever tolerable in execution, has been unskilfully retouched there can be no doubt. Even inferior English portraits of the late sixteenth or early seventeenth century, however archaic in style or rudely drawn, are seldom "messy" in their handling. This one bears signs of over-daubing in more than one place, especially above the right eyelid. The high lights on the tip of the nose and in one corner of the mouth have evidently been superadded, while the hair and portions of the background appear to have been repainted with some bituminous medium.

I pass over the presumed anachronism presented by the "cursive" letters of the inscription, because inscriptions on pictures afford, at best, but dubious evidence of authenticity. It is not necessary to regard the Droeshout picture as a forgery. Indeed, if it had been one, we might have expected better

work. Much more probably it was produced by some inexperienced painter or amateur who, perhaps two centuries ago, amused himself by trying to copy the well-known print in oil-colours. It is quite possible that more than one of the numerous portraits of Shakespeare now extant may have been painted from life. But it does not follow that Martin Droeshout based his engraving on either of them. The print may have been executed from a drawing which has long since perished. The "counterfeit presentment" which it recorded survives in a traditional form, but it shares the fate of other traditions in having been from time to time modified, idealised and sometimes perverted by posterity.

ST. PETER, STANTONBURY.

THE old church of St. Peter, Stantonbury, Bucks, stands in the fields overlooking the river Ouse, remote from human habitation, and it is now seldom used. The building escaped the fate of the Manor House, to which it was no doubt a chapel. The site of the house is still visible, with its terraces and bowling-green, though the house has been razed to the ground. The church is very small, and now consists of a nave, chancel and north porch only. The nave is Norman. On the north there are two large Norman arches, ornamented with zigzag moulding, which apparently separated the nave from the north aisle. These arches have been built up, and the north aisle, if it ever existed, has disappeared. The northern doorway is Norman, and is probably not in its original position. The southern doorway is also Norman, but has been blocked up, and the lower part is concealed by the raising of the soil of the graveyard. At the west end of the church the old stone bench still remains. This is an interesting and somewhat uncommon feature in a parish church. In the gable there is a single sanctus bell behind a curious little doorway; there is no bell-cote. Close to the chancel arch there is a niche with an early arch. This might have been a window or the resting-place of a saint. In the south wall is a piscina. The chancel arch is of richly decorated Norman workmanship of two orders, with detached shafts, well carved capitals and beak-head moulding round the arch. Within the circular arch is a pointed arch of rude execution, ornamented with a band of late Norman work. The pulpit is of the Jacobean period, with well carved panels. It is very small, pentagonal in shape and set close in to the angle of the south aisle. The chancel is Early English, and is rather long in proportion to the nave; there is no window now on the south side. On the north side there are two ambries and one on the south side; there is also a sedilia on the same side. The altar rails are probably Jacobean; they are very slight. Outside it will be noticed that the buttresses on the west are set back some little distance from the angles of the northern and southern aisle walls.

SOUTH LONDON TECHNICAL ART SCHOOL.

THE following reports are published by the Council of the City and Guilds of London Institute:—

"Mr. Tyrrell has reported the details of some of the works executed, and the successes gained by past and present students during the year, and I venture to think his list is a remarkable one as showing how the school has fulfilled its purpose, and the wide field over which its influence extends. Taking one instance—The new 'Lloyd's Registry' in Fenchurch Street, probably the most notable building recently erected in London. The external sculpture was designed and modelled by G. Frampton, R.A., and the carving was mainly the work of students of the school, Messrs. Tyrrell, Allen, Mills and Rutland being engaged in its execution. The ornamental carving was executed by Mr. Taylerson and the internal metal frieze by Mr. Lynn Jenkins, both past students. On another notable building, 'Electra House,' the work of Mr. G. Frampton, R.A., Mr. Goscombe John, A.R.A., F. W. Pomeroy, H. Hampton, T. Tyrrell, C. Rutland and C. Gunthorpe occupy positions of the first importance. The works in the Royal Academy Exhibition, numbering about one-quarter of the total sculpture exhibits, and the works contributed to the various competitions for memorials to the late Queen Victoria, as well as for other competitions, all bear witness to the artistic capacity and activity of the students who have passed through the school. This, no doubt, will be gratifying to the Council of the City and Guilds of London Technical Institute, to whose generous support these results are due, and should give them the satisfaction arising from the knowledge of having done a good work. I believe this is thoroughly appreciated by all those connected with the art of sculpture and carving. Indeed, at a recent meeting of an artistic society which includes the great majority of art-workers, and those of the highest attainments, I had the great gratification of hearing a most eloquent and appreciative tribute by Mr. G. Frampton, R.A., to the work that has been

performed in the school. Those students who were present (and subsequently those absent who heard of what was said) took opportunity to say they wished cordially to associate themselves with all the remarks that had fallen from Mr. Frampton. Whether our school holds the distinguished position there claimed may be open to some question; but that this school has largely contributed to that revival in sculpture which is an acknowledged fact, and has been an important factor, indeed, doing all that was practicable towards placing our country in a position of equality in all branches of the art of sculpture with the other countries of Europe is, I submit, beyond dispute. "W. S. FRITH."

"The Royal Academy for the past year exhibited 130 pieces of sculpture, twenty-five of which were by men who have passed through the schools. The Liverpool Victoria Memorial competition, which was in uncertainty at the time of my last report, was eventually won by Mr. C. Allen, and is being executed by him. Mr. A. Turner obtained the Sheffield competition for the execution of a statue of Her late Majesty Queen Victoria. He (Mr. Turner) also was commissioned to execute a Victoria memorial for Delhi. A replica of this work he produced for the town of Shields. Mr. Hampton has no less than five statues of the Queen to execute in bronze and marble. Mr. Price is in the final three for the Armstrong Memorial for Newcastle-upon-Tyne. Mr. Poole is engaged on some important work for the new town hall in Cardiff. Mr. Broadbent is also modelling and carving a memorial building for Bradford. There are at present six of our students studying in the Royal Academy schools. Mr. Ransom last year won 20% for modelling from the life, and Mr. Crisfield gained the Armitage competition of the value of 30% for figure design, the subject being 'The Expulsion.' The London County Council have awarded five of our students exhibitions in sums varying from 20% a year for three years down to 5% for two years. Mr. M. Morahan, our last year's silver medallist, has been appointed teacher of modelling and carving to the Borough Polytechnic. Mr. Brock, R.A., judged the scholarship and the travelling studentship. The scholarship, the subject was a sundial, was won by Mr. Cecil Fabian; a good second was by Mr. E. G. Payne. Mr. Payne's work afterwards took a County Council scholarship of 20% for three years. The travelling studentship, the subject was a shield, was taken by Mr. F. Roselieb. The second place, carrying honourable mention, was given to Mr. Harold Parker. Some horses in Mr. Parker's shield were so able that Mr. Brock asked him to assist him in his studio. Mr. Colton awarded the drapery study competition. Mr. J. Gordon was first and Mr. P. Allen the second. Mr. Frampton, R.A., awarded the best place in the section of design to Mr. Ernest Smith, Mr. P. G. Bentham being second. Mr. Frampton spoke very highly of the figure-work and the design, which he said was very creditable, several of the works showing great promise. "T. TYRRELL."

"Since writing my last report concerning the life classes under my charge, I can again assure you of the excellent work and endeavour on the part of my students. The attendances have been most regular and satisfactory, and the number of students averaging as in previous years, the day classes in this respect being particularly gratifying. Of the many old students I have mentioned in previous reports, whose names it is perhaps unnecessary to recapitulate, all I hear are doing well. The last two students to join their ranks are Mr. R. H. Smith, who is getting plenty of work as an illustrator of marine subjects, and Mr. Edwin Noble, who has lately been publishing some excellent sporting prints. Of those teaching, in addition to their ordinary illustrating work, are Mr. H. Cole, who holds a post at the Camberwell School of Arts and Crafts, and Mr. H. Watson under the Technical Education Board. Mr. Oliver Dawney has gained a London County Council scholarship of 20% per annum for two years, having previously held an exhibitionership of 10% under the same body. Mr. W. C. Penn gained the Armitage scholarship of 30% at the last Royal Academy school competition, and in addition to these very recent events I find that thirteen of our past and present students exhibited twenty-four works in the last exhibition of the Royal Academy. Of many of our students engaged in commercial artwork it is exceedingly difficult to trace their performances, the majority of whom become absorbed by the firms for whom they work, where it is most unusual to individualise the efforts of their employés. There is an enormous amount of work executed at the present day in show cards, posters and artistic advertisement of all kinds, the designers of which must necessarily be skilled artists, and those men who do such work practically form the bulk of our students. Frequently some are able to work independently, and one I may mention, Mr. H. Dobson, has now twelve to fifteen men assisting him, several of whom, I am glad to say, are at present attending the schools in the evenings. It is difficult for those not actually engaged in the work to appreciate the benefit of such an institution as this to the great mass of men who are not able to work entirely on their own account. Their study here forms a stepping-stone to

higher positions and better remuneration for their work, and raises the artistic standard of those who have the energy to take advantage of the privileges of study we are able to give them here. "INNES FRIPP."

Mr. Stevens writes :—

"In making my report of the past year's work, I am glad to be able to say that the class goes steadily and successfully forward. Ours is a class that provides men that are a very great help to employers, as we are practical workers, and it is very difficult to obtain English workmen that can be entrusted to perform the work in the higher branches of house decoration, and it would be a great assistance, both to the employers and the employed, if the class could be brought under their notice more thoroughly. The attendance of students is greatly improving, and the standard of work is also much more advanced. Two students have obtained good situations, one, Mr. Waterman, with the P. and O. Company, and Mr. Bishonden with Messrs. Mowlem & Co. The others that have used the class I hear excellent accounts of. One student, Mr. P. Stevens, has been awarded an artisan scholarship, by the London County Council of 30%. This makes the fourth; one for 60%, one for 30%, one for 15%, and one for 5%. More students have joined this session than ever before, as the class is becoming more widely known and appreciated."

ST. MAGNUS'S CATHEDRAL.

THE following statement has been issued by the Society for the Protection of Ancient Buildings:—

A local correspondent, writing to the *Orkney Herald* on the 13th of last month, calls attention to the destructive restorations at present going on under the patronage of the Magistrates and Town Council of Kirkwall. He says:—

"I have contested, point by point, almost every part of the work privately with those in power, and have been defeated all along the line, and I am forced in self-exoneration to give the matter more publicity. I am the more encouraged to do it now, since the operations executed upon the west gable last week seem to have aroused more sympathy with my views." And at the end of the letter—"I do hope that what remains of Taylor's legacy may be diverted from its injurious mission and applied so far as it will go to undoing the mischief it has caused. Let the inhabitants rise to the occasion and insist upon the removal of the new work, and relaying of the old skews and cross, and checkmating the contemplated work upon the windows and porch beneath them."

The spoiling of St. Magnus's Cathedral is a tragedy that must appeal to a far wider audience than the inhabitants of the islands.

The Society first had its attention called to the subject by the letters that appeared in the *Scotsman* of August 1893, but it was not until the spring of 1900 that the matter became acute. The Town Council had by then called in an architect to advise them, and his report had been published in the local Press. The Society at once addressed the Council. The following passages are quoted from the letter:—

"The principles for the proper repair and maintenance of our ancient buildings have been matured by the Society during twenty-three years of existence, in considering thousands of cases in detail and in acting in a wholly voluntary and disinterested way.

"From the beginning it had the active advice and support of such men as John Ruskin, Thomas Carlyle, William Morris and others. The problem, as they understood it, was to maintain our ancient historical buildings in good constant repair, while resisting to the utmost a passing fashion for smartening, scraping and renewing, which in England has largely destroyed the historical authenticity and the beauty of our cathedrals.

"We hold that every penny of money called for absolute repairs should be spent in doing these repairs as perfectly as possible, but that every penny spent beyond that sum in alterations, renewals or supposed improvements by addition will be a certain percentage written off the value of the building.

"It is with very great pleasure that we note that the architect's report recommends that the marvellously beautiful west porches should be left untouched, and that no alteration should be made to the central tower. Only a few years since the most eminent architects would probably have advised that the thirteenth-century west doors should all be cleared away and replaced by a copy and conjecture. A doorway not inferior to these in beauty was destroyed in this way at Lichfield Cathedral some years ago. The same principle, however, should apply to the whole of the ancient work inside as well as out, and not an inch of imitative work should on any account be allowed in the building. Where new stones must be added for reasons of safety, they should in every case be square and unmoulded, even if coming against moulded work,

for the object is not to puzzle but to proclaim, 'This is repair, not a sham.' No merely ornamental parts like the little shafts to the windows should be replaced."

To this letter a sympathetic reply was received, but as facts now prove, the recommendations of the Society were entirely ignored.

In the following spring (March 1901), as the result of a visit made to the cathedral by two professional members of the Society, a letter was again addressed to the Town Council calling their attention to the destructive work then going on. It was pointed out:—"That instead of the old pointing being repaired where repair was most needed, nearly the whole has been gone over, the filling of the old joints being raked out and the new pointing filled in in a uniform and commonplace way—and, worse than all, the new pointing has been 'lined out' in a way entirely unsympathetic with the character of ancient work and terribly injurious to the scale and beauty of the ancient masonry."

The following passage is also quoted from the same letter:—"In speaking of the work already done, we have in view to ask you once again to consider the results of a general scheme of 'going over' ancient work in a uniform way, instead of careful detailed repair of any portions worst decayed, leaving the rest to be dealt with in the future as the occasion may arise. We also specially invite your attention to the noble west front, as yet untouched by a modern hand. This front does not require large pointing repairs, and if the masonry of this front is treated like the adjoining bays on the north side an irreparable injury will be done."

The letter concluded with some technical advice on pointing and the composition of the mortar.

The Council requested the architect under whose direction the work was being executed to reply to the above letter, and expressed themselves perfectly satisfied with his reply.

In 1902 in reply to further inquiries addressed to the Council, the Society was referred to the architect, "by whose advice and according to whose directions the repairs were being carried out." The correspondence with the architect proved entirely one-sided, and the Council took up the position that it was not in their province to make the architect reply to the Society's letters if he did not think proper to do so.

In August last a member of the Society visited the cathedral and reported that the south aisle was being scraped, and that the traces of ornament on the ribs of the arches were to be destroyed. And last month in the *Orkney Herald* there appeared the letter referred to above calling attention to the fact that, in spite of the many protests, the recent money legacy for the preservation of the fabric is being spent on the destruction of one of the most romantic buildings in Great Britain.

THE RELATION OF WINDOW-AREA TO FLOOR-SPACE.

DURING the last few weeks, says the *American Architect*, a somewhat informal, though careful, effort has been made in the halls of Cornell University to determine a general statement of the relative proportion between window-openings and their position, and the floor-area and the depth of the rooms to be lighted.

The data were intended to apply to the problem of securing an adequate supply of natural light in the lecture-rooms on all ordinary days between 8 A.M. and 5 P.M., under the climatic conditions which prevail in Ithaca, N.Y., conditions in no way differing from those usually found in this latitude.

Information was secured which was based on actual experience in six buildings on the Cornell Campus, and referred to rooms lighted from one side only. From the statements submitted by the professors in charge of the work in the several buildings the following data have been compiled regarding sixteen rooms adequately lighted, and nine rooms in which the light is "nearly sufficient."

Number of Rooms.	Total Area of the		Ratio.	Average Height of		Ratio.
	Floors.	Windows.		Room.	Window-tops.	
Sufficient 16	10,466	2,000	1,000:191	22 1	11 9	1,000:538
Nearly so 9	5,392	799	1,000:146	20 6	10 2	1,000:495

All these rooms are alike in having unobstructed light; no buildings stand before the windows.

A peculiar relation which should be observed is that the well-lighted rooms have an average of 654 square feet of floor-area and average 22 feet 1 inch deep, while those whose light is "nearly sufficient" are smaller and shallower, being of 599 square feet area and 20 feet 6 inches deep.

One explanation of this unexpected result is found in the figures relative to the positions of the windows. In the well-lighted rooms the window-tops average 11 feet 9 inches above the floor and 1 foot 6 inches below the ceiling; in the other rooms they are 1 foot 7 inches nearer the floor and 11 inches further from the ceilings.

The conclusions to which this local experience leads are these:—

1. There should be at least 150 feet of window-space for each 1,000 square feet of floor-space in rooms which, in use and location, are similar to those here described, and are lighted only from one side.

Therefore an office 15 feet by 25 feet should have at least 56 square feet of window-space, and a classroom 30 feet by 40 feet should have at least 180 square feet of unobstructed lighting surface.

2. The proportion between the height of the window tops and the depth of the room lighted should be at least 500 to 1,000, or, in other words, the distance from the floor to the window tops should be one-half the depth of the room to be lighted.

These figures support the old principle that "top light" is the best; the nearer the window tops come to the ceiling the more efficient will be the lighting to be secured from a given surface. Care should be taken that overhanging lintels be not allowed to obstruct the light.

GENERAL.

The Completion of the public buildings now in progress in London has been officially announced for the following dates:—New War Office, June 26, 1906; new Public Offices in Parliament Street, June 1, 1907; Royal College of Science, June 1, 1905; Victoria and Albert Museum, February 23, 1907; Admiralty (Block III.) (say) June 30, 1906. (Contract about to be made for superstructure.) Such progress is being made with the above works as to justify an assumption that they will be completed by the specified dates. In some cases it is possible that the fittings will not all be finished, but every effort will be made to avoid delay.

Herr Andrae, who has been engaged as one of the principal explorers for the past four years in Babylon, is compelled to return to Germany in order to follow his service in the army. Archaeology has to succumb to the military spirit of the empire.

The Committee appointed to consider the proposed restoration and renovation of certain parts of the Temple Church, including the rebuilding of the turret and steeple and the restoration of the doorways and arches, have adjourned the consideration of the matter until after the Long Vacation in November next. In the meantime, it may be stated that the reports as to the dangerous condition of the ancient structure are without foundation, as the building is perfectly sound, and will, it is said, remain safe for many years.

A New Museum, which if possible will unite the characters of the Victoria and Albert Museum and the Museum of Arts and Manufactures in Paris, is about to be established in Munich. In it will be placed the Pettenkofer collection of physical and mechanical apparatus. The architect is Herr Oscar Miller.

The Court of Common Council have resolved not to hold another loan collection in the art gallery of the Guildhall until 1905.

M. Osiris has had a bronze casting made of the *Moses* of Michel Angelo, which is to be placed on the tomb of his family in Montmartre. A copy in marble, which was in the same position, will be presented to the Orientalists' School at Auteuil.

The Sub-Committee on Building of the Lord Mayor's Committee of Inquiry into the affairs of St. Bartholomew's Hospital met on Friday at the Mansion House. Alternative plans for the proposed improvements at the hospital were submitted by the architect (Mr. P'Anson) and considered together with reports upon them by the Medical Council. A new out-patients' department being imperatively necessary, it was decided by the committee that that work ought first to be proceeded with. The estimated cost of the work is about 100,000/.

The Government of Peru have organised an international competition for the purpose of obtaining designs for the reconstruction of the Executive Palace at Lima. The first premium will be of 3,000/., and the second of 1,000/.. The competition will be closed December 31, 1903. Full particulars may be obtained from the official representatives of Peru.

The Eighth Annual General Meeting of the British Association of Waterworks Engineers will be held at Bolton, on Tuesday, Wednesday, Thursday and Friday, July 21, 22, 23 and 24; under the presidency of Mr. Robert H. Swindlehurst, waterworks engineer to the Corporation of Bolton.

The Committee of Management of the City Orthopaedic Hospital are carrying out considerable improvements and additions to the premises in Hatton Garden, consisting of new isolation ward, registration and consulting-rooms and nurses' cubicles. The architect is Mr. F. T. W. Goldsmith, A.R.I.B.A.

Mr. Frank H. Gorst, of the firm of Richard Gorst & Son architects and surveyors, of 7 Birley Street, Blackpool, has been selected as the architect for the new church to be built for All Saints parish, Blackpool.

THE Architect and Contract Reporter

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000*l.* inclusive. Premiums of 30*l.*, 20*l.* and 10*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

CONTRACTS OPEN.

ACCRINGTON.—July 14.—For the erection of bank premises, Blackburn Road, Accrington. Mr. Henry Rose, architect, 15 Cannon Street, Accrington.

ALLERWASH.—July 8.—For the erection of a pair of cottages at Allerwash, near Fourstones. Mr. C. H. Sample, land agent, Matfen, Corbridge-on-Tyne

BAILDON (YORKS).—July 9.—For the erection of a residence. Mr. Sam Bradley, architect, Yorkshire Bank Chambers, Shipley.

BARNSELY.—July 10.—For erection of five houses, Hunningley Lane, Stairfoot. Mr. Ernest W. Dyson, architect, 14 Market Hill, Barnsley.

BERMONDSEY.—July 8.—For the casing of the front steps of the town hall with marble. Mr. R. J. Angel, borough surveyor, Town Hall, Bermondsey.

BIGGLESWADE.—July 14.—For the erection of vagrants' ward, disinfecting chamber, work-sheds, &c., at the work-house. Mr. J. Owen Jones, Shortmead Street, Biggleswade

BRADFORD.—July 6.—For the erection of shop property in Manningham Lane. Mr. Jas. Ledingham, architect, District Bank Chambers, Bradford.

BRADFORD.—July 7.—For the erection of electricity station at Sunbridge Road destructor works. Mr. F. E. P. Edwards, city architect, Whitaker Buildings, Brewery Street.

BRADFORD.—July 8.—For the erection and fitting of mortar-pan shed and engine-house at Sunbridge Road destructor works. Mr. F. E. P. Edwards, city architect, Whitaker Buildings, Brewery Street.

BRIGHTON.—For plastering the exterior of Manor House, Brighton, near Howden, Yorks. Mr. T. S. Ullathorne, architect, Selby.

BRIERFIELD.—July 14.—For the erection of a police station and courtroom at Brierfield, Lancs. Mr. Henry Littler, architect, County Offices, Preston.

BRISTOL.—July 9.—For refronting premises in Marsh Street, Bristol. Mr. T. H. Yabbicom, city engineer, 63 Queen Square, Bristol.

CARLISLE.—July 13.—For alterations to the Crown Court, Carlisle. Mr. Geo. Dale Oliver, county architect, Carlisle.

CARLISLE.—For the erection of a new house for the medical superintendent at Garlands Asylum. Mr. Geo. Dale Oliver, architect, Carlisle.

COCKERMOUTH.—For repairs and painting of All Saints Church, Cockermouth, and spire, reslating part of the roof, boarding ceiling and other general repairs. Mr. John Fleming, Market Place, Cockermouth

CROYDON.—July 6.—For an addition to the dining-hall and alterations to the laundry at the workhouse, Queen's Road. Mr. F. West, surveyor, 23 Coombe Road, Croydon.

DARLINGTON.—July 8.—For the erection of a wing to the technical college, comprising lecture theatre, engineering drawing-office, classroom, &c. Mr. G. Gordon Hoskins, architect, Court Chambers, Darlington.

DARTFORD.—July 7.—For the erection of a boundary wall at the infectious hospital, Bow Arrow Lane, Dartford, Kent. Mr. Robert Marchant, architect, 28 Theobald's Road, W.C.

DARTMOUTH.—July 6.—For the erection of four houses in Victoria Road, Dartmouth. Mr. E. H. Back, architect, Dartmouth.

DERBY.—July 6.—For the erection of a battery-house at the electric-light station. Mr. Arthur Eaton, 6 St. James's Street.

DEPTFORD.—July 14.—For the erection of four blocks of five-storey working-class dwellings at Hughes Fields. Particulars can be had at the Architect's Department, L.C.C. (Housing Section), 19 Charing Cross Road, W.C.

DORSET.—July 15.—For repairing and painting the exteriors of the following police stations throughout the county, viz. WALTHAM ABBEY.—July 7.—For the construction of foundations for the new public offices, fire station, &c., at Waltham Abbey. Mr. W. Turner-Streather, surveyor, High-bridge Street, Waltham Abbey.

WHITECHAPEL.—July 6.—For structural repairs and alterations at 403, 405, 407 and 409 Mile End Road, E. Mr. F. J. Tootell, clerk, 74 Vallance Road, Whitechapel, N.E.

WICKLEWOOD.—July 6.—For alterations and additions to the workhouse at Wicklewood. Mr. J. Owen Bond, architect, 15 Upper King Street, Norwich.

THE old station buildings at Carnoustie having been found inadequate for the heavy traffic, the directors of the Dundee and Arbroath Joint Railway decided some time ago to erect new station buildings. A portion of these, the buildings on the north platform, are now almost completed, and when the whole is finished the station will be one of the finest of its size on the East Coast of Scotland. The platform has been made several yards wider than before, while the buildings, waiting-rooms and office are well appointed and well finished. A glass roof, the supporting girders of which are tastefully painted, shelters a large portion of the platform. These and several other alterations will be much appreciated by visitors during the coming season.

is 50 feet wide, providing two footways each 7 feet wide, in place of a single footway from 2 to 3 feet wide in the old structure, and a 36-foot wide carriageway. The gradient is comparatively easy, and what is perhaps of more importance, a fairly straight line with the railway bridge to the north has taken the place of the zigzagging roadway of the olden days. Built of freestone, with a granite arch, it has a span of 60 feet, and is at the centre of the arch 10 feet above the bed of the stream. An ornamental touch has been given to the parapets by the construction of balustrades immediately over the archway. Otherwise they are plain and solid, stand 4 feet 3½ inches above the pavement, and are on the east side 205 feet and west side 300 feet long. In the centre of the balustrades on both sides bronze tablets bear an inscription setting forth that the bridge was built at the joint expense of the Corporations of Edinburgh and Leith, when Sir James Steel, Bart, was lord provost of the city, and Mr. Richard Mackie, provost of the burgh.

ELECTRIC NOTES.

THE Inverness Town Council have resolved to remit to a special committee to enter into negotiations with a company or companies for the introduction of electric light.

THE electric-light committee of the Coventry City Council have recommended that application be made for sanction to borrow 5,000*l.* for the purchase of electric motors to be let on hire.

MR. R. H. BICKNELL, a Local Government Board inspector, held an inquiry at the municipal buildings concerning an application by the Maidenhead Town Council for sanction to a loan of 10,000*l.* to extend their electric-light buildings and add new plant, cables, mains, &c. Mr. Burstall, the consulting engineer, informed the inspector that the original estimate was 24,249*l.*, and the actual expenditure 23,022*l.*

THE joint committee of the tramways and electricity departments of the Glasgow Corporation have agreed (1) that the total quantity of current now to be taken from the tramways department by the electricity department (including the 150,000 units, or any increase of that quantity, taken from the Coplawhill sub-station under the arrangement of date April 10, 1902) should be fixed at not less than 700,000 units, and (2) that it be remitted to the general manager of the tramways department to consider and report as to the price

at which the quantity of current to be taken from Pinkston station should be furnished to the electricity department, after which the details of the proposed new arrangement between the two departments can be finally adjusted and recorded in the minutes.

THE accounts of the Leeds Corporation tramways for the first year since they were completely worked by electricity show the profits to have been equal to a rate of 8*d.* in the pound. The gross profits, 103,055*l.* 3*s.* 9*d.*, were 21,911*l.* 3*s.* in excess of those of the previous year. From the gross profits, 103,055*l.*, the sum of 26,667*l.* has to be deducted for interest, and 14,387*l.* for sinking fund. The profit to the ratepayers amounts to 62,000*l.*, which is 13,758*l.* more than in the preceding year, while comparing the amount with that of two years ago the surplus is practically doubled. The net profit is equal to 24 per. cent. of the total receipts, and this is about 3 per cent. more than in the previous twelve months.

BUILDING AND BUILDERS.

MEMORIAL-STONES have been laid of a new Methodist chapel which is being erected in Smart Road, Walton, the estimated cost of which is 3,600*l.*

THE general purposes committee submitted to the Sutton Coldfield Town Council on Wednesday the plans of the new town hall and fire station for approval, and recommended that application be made to the Local Government Board for their consent to appropriate the proceeds of the old town hall and offices in Mill Street (4,050*l.*) towards the erection of the new town hall, and for their sanction to borrow 4,086*l.*, the balance of the sum required to cover the cost of the erection of the hall. Further, that application be made to the Local Government Board for their sanction to borrow 1,920*l.* for the cost of the erection of the new fire station.

THE memorial-stones of a new Wesleyan church, to be erected on the Derby Road, Long Eaton, were laid on the 26th ult. The building which has hitherto done duty for both chapel and Sunday school was built sixteen years ago, and with the rapid increase of population in the immediate vicinity the disadvantages of carrying on services and Sunday-school work in the same building have become more pronounced. The erection of a new church and the enlargement of the Sunday school were consequently decided upon, and are now in course of fulfilment. The estimated cost of the buildings and site is 9,300*l.*

THE Glasgow and West of Scotland Master Plumbers' Association held their annual excursion on the 25th ult. Driving from Edinburgh through the policies of the Duke of Buccleuch, the party, numbering about 100, lunched in the Dalkeith Cross Keys. In the afternoon the drive was continued by Melville Castle to Roslin, the party returning by brakes to Edinburgh, where they dined at Ferguson & Forrester's. Ex-bailie Macfarlane, Port Glasgow, presided, and the croupiers were Messrs. Robert Russell and Chas. Higney, jun. After dinner the toast of "The King" was given in felicitous terms by the chairman, who also submitted "The Guests," coupled with the names of Major Findlay, who represented the Master Wrights' Association, and Mr. Webster, of the Master Masons' Association, both making appropriate replies. The party arrived in the city shortly after eight o'clock.

MR. H. P. BOULNOIS, Local Government Board inspector, held an inquiry at the Council Chamber, Birmingham, into the merits of a scheme prepared by the London and North-Western Railway Company for providing new dwellings for persons of the labouring class. It was explained by Mr. W. Bishop, solicitor, London, that the London and North-Western Railway Company proposed to acquire thirty-three houses near Monument Lane station for the purpose of improving the railway. The houses were occupied by persons of the labouring class, and it was proposed, in accordance with statutory obligations, to provide accommodation for the persons displaced, numbering 122, by erecting houses at no great distance from the dwellings which would in the near future have to be pulled down. It was intended to erect nineteen new houses, each house containing five rooms, with yard, &c. Mr. Bishop suggested that the site, which Mr. Boulnois had inspected, was eminently suitable and desirable. Accommodation would be provided for all the people who would be displaced. The new houses, too, would be superior to the old ones. Further information was given to Mr. Boulnois by Mr. Stannard, district estate office of the company. Messrs. Ball & Hatley, of the chief estate office, were also present. The Local Government Board will receive a report in due course.

grounds of the Royal Botanic Society, Regent's Park. Absolutely perfect summer weather favoured the function, the success of which was a record. The grounds were brilliantly illuminated with electric light and gracefully arranged Japanese lanterns. On the west lawn and in the conservatory military bands performed the numerous items of lengthy programmes to the manifest delight of appreciative listeners; a magnificent exhibition of rhododendrons and another of roses attracted flower lovers in the intervals of the pieces; while the rival marquees, in which were dispensed strawberries and cream and other delectable summer consummations, were not less assiduously frequented. Altogether the Society may be congratulated on having given an entertainment of which pleasant memories will remain with those who were so fortunate as to be present.

THE Newington Adamant stone, which is being put on the market by the Newington Adamant Stone Co., of Pulman Street, Newington, Hull, is an artificial stone manufactured by experienced men under the direct supervision of the manager, Mr. H. Vokes, and is guaranteed by the makers to be equal to natural stone in appearance, and to offer the following advantages over the latter to the user:—Greater durability, it being practically indestructible; it is more economical, its cost being considerably below the natural stone; it can be made to any shade of colour; it possesses an attractive appearance and perfect finish; and is non-absorbent.

50 HOLBORN VIADUCT,
LONDON, E.C.

The second illustration is from a photograph of the Stand arranged by Mr. G. Riches, of Cromer, whose specialty is hand-moulded, sand-faced red bricks. The above specimen of work, with gauged carved centre panel introduced to illustrate how especially adapted are the bricks for this class of work, was designed by Mr. W. Barnsley Hughes, architect, of 31 Craven Street, W.C.

TRADE NOTE.

A LARGE new clock has just been erected upon the church tower at Beadnell, Northumberland, in commemoration of the Coronation. Messrs. John Smith & Sons, Midland Clock Works, Derby, have carried out the work, and they are also just completing a similar clock for Colnbrook, near Windsor.

THE SPEEDON RADIATOR.

THIS is a new radiator now being presented to the public by the Coalbrookdale Company, Ltd., 141 Queen Victoria Street. It is a complete hot-water circulating system within itself, being boiler, circulating pipes and radiator combined. It can be placed anywhere; takes up little space; is perfectly safe and odourless; requires no chimney. It costs, we are told, less than one farthing per hour, and is eminently suitable for bedrooms, bath-rooms, libraries, drawing-rooms, shops, churches, schools, greenhouses, &c. It is fitted with an automatic attachment which turns the gas down when the temperature of the water reaches 197 degrees, and retains its heat for a considerable length of time after the gas has been quite extinguished.

MAYRESCO.

MAYRESCO is the name given by Messrs. Mayfield Bros., of Sculcoates, Hull, to a new water-paint and sanitary washable distemper which is fireproof, free from lime or other alkali, and lime-resisting, and is equally applicable to wood, iron, brick, stone, or plaster. It is made in pure white and a variety of delicate tints. It will take varnish, forms a valuable priming, and, it is claimed, applied to old tarred work, will effectually prevent the tar from coming through new paint.

HOUSES IN IRELAND.

A PAPER on "The Housing of the People of Ireland during the Period 1841-1901" was read by Mr. R. E. Matheson, registrar-general, at the last meeting of the Statistical and Social Inquiry Society. It stated that during the sixty years there was a gradual reduction in the number of houses from 1,328,839 to 858,158. There was also a great alteration in the relative number of houses. Thus mud cabins, which in 1841 numbered 491,278, fell to 9,873 in 1901. In considering this decline it should be borne in mind that a large portion of the decrease was due to emigration. Houses of a somewhat better class also showed a considerable falling off, while second class dwellings or good farmhouses gradually increased from 264,184 to 521,454, and first-class houses of a better description than the preceding rose from 40,080 to 75,225. As to house accommodation in the whole of Ireland, he said in 1841 the number of families having only fourth-class accommodation formed 42.46 of the total families in the country, and in 1901 the percentage was only 4.53. The percentages of third-class accommodation respectively were 39 and 31.64. In the second-class the figures were 16.41 and 56.37, while in the first-class the figures were 2.13 and 7.46 respectively. Dealing with one-room tenements, he said of the 59,265 families in Dublin 21,747 were located in one-room tenements, or 36.70 per cent. The percentage in Belfast was 1; Cork, 10.62; Londonderry, 7.15; Limerick, 15.80, and Waterford, 7.28. Comparing Dublin with other big cities it was found that the number of persons in one-room tenements with five or more occupants in every 100 of the total population was—Dublin, 10.61; Belfast, 0.10; London, 0.70; Liverpool, 0.24; Manchester, 0.05; Edinburgh, 2.33; Glasgow, 5.24. In conclusion, he said that the material improvement in the housing of the people of Ireland since 1841 was very satisfactory, but there was still much to be accomplished. The substitution of modern labourers' cottages in the rural districts for mud cabins and the erection of artisans' dwellings in some of the larger urban districts had done much to provide suitable habitations for the people, but the statistics of tenements of one room showed that in many parts a considerable proportion of the population were still exposed to the evils resulting from overcrowding. It was gratifying to know that the subject was attracting earnest attention in Dublin, where great good had been effected through the princely munificence of Lord Iveagh. The movement for the dwellings of the poor had recently received an important

TELEGRAMS.

"Trowelled. London."

impetus by reason of the great practical interest manifested by His Excellency the Lord Lieutenant.

Mr. Ormsby, president of the Royal College of Surgeons, said he felt that the rich did not often think or know of how the poor lived, and very often these poor dwellings were within a stone-throw of the houses of the wealthy. He maintained it was the bounden duty of everyone to do something to ameliorate the condition of their poorer brothers. The condition in which they lived was a blot on civilisation and a reproach to Christianity. At the recent meeting in the College of Surgeons, presided over by His Excellency, he was much disappointed at the apathy shown by those who attended. Out of that large meeting not more than a dozen responded to the appeal of taking even one share, where they were promised 3 per cent. for their money.

Mr. Frederic W. Pim said overcrowding was the greatest evil from which Dublin suffered. It suffered both morally and physically, and little improvement might be looked for until houses were built for the poorer population, and until they were removed from the terrible overcrowding and the wretched condition in which they lived at present.

EAST LONDON WATERWORKS.

THE East London Waterworks Company have opened two new reservoirs at Walthamstow. The company have now twelve storage reservoirs in the Lea Valley, which, when full, have a combined water area of 479 acres, and a total capacity of 2,400 million gallons, and a shore line of over fifteen miles. All of the reservoirs can be filled by gravitation, with the exception of the two new ones, which can only be filled half-way by that means. The other half has to be filled by pumping. The Act of 1897 granted the company powers for the construction of these two new reservoirs, which have been named the Banbury and the Lockwood, a pumping station, aqueducts and further diversions of the Lea and Ching Brook, which works are now approaching completion. In 1900 powers were obtained for removing the intake on the Lea from its present position at Ponder's End to Enfield Lock, for constructing two storage reservoirs to cover an area of about 1,000 acres between Enfield Small Arms Factory and Chingford Mill, and for building a pumping station, forming aqueducts, diverting roads, and other incidental work. The works to be carried out under the powers of the Act of 1897 were begun in May 1899, and the two new reservoirs have a

combined capacity of 1,198 million gallons. This will nearly double the water storage for East London. Brick-lined aqueducts, over a mile and a half in length, have been constructed, as well as inlet and outlet work for both reservoirs, while the river Lea diversion extends to a mile and three-quarters. In the new pumping station, which is situated close to the Banbury reservoir, and has been called the Greaves, pumps have been erected. These are capable of lifting 105 million gallons of water a day. The chief difficulties of the works were in connection with the puddle trench of the Lockwood reservoir, where it was found necessary to carry the excavations down to 60 feet below the ground level. The length of the banks encircling the new reservoirs is over three miles. The northern extremity of the new works adjoins the Chingford pumping station, and the water here enters a double culvert and also the new aqueduct, 36 feet wide, which is capable of carrying 180 million gallons daily. This aqueduct extends for half a mile to the Greaves pumping station, where there are the three new centrifugal pumping engines to lift water from the aqueduct into the Banbury reservoir. From this aqueduct a similar channel, 20 feet wide, with a carrying capacity of 80 million gallons per day, leads to the High Maynard reservoir, a mile further south, passing on the way the inlet chamber to the new reservoirs. Three cast-iron pipes lead vertically down for 50 feet from the inlet chamber to a tunnel 577 yards long, connecting the two reservoirs. The tunnel has a valve tower at each end—one in each reservoir—and there are also valves on the vertical inlet chamber pipes so that water can be directed from one reservoir to the other, or from the aqueduct to either reservoir, or from either reservoir to the aqueduct as the water level will allow. At the south end of the Lockwood reservoir is another valve tower, at the commencement of an outlet tunnel, leading to the Capper Mills aqueduct, whence the water can pass to the Lea Bridge station.

BUILDING IN GLASGOW.

EVIDENCE was given on behalf of the operative masons before the Glasgow Municipal Commission on the Housing of the Poor. The witnesses were Mr. A. M'Gillivray and Mr. Thomas Fraser.

They said that, viewing the matter, firstly, from their standpoint as workmen, the cost of building (including high wages

&c.) and the rise in the price of materials were not the main causes of the excessive rise in rents. The cost of erecting houses had risen considerably of late years, yet in districts where the expense of building was greater than it was in the city, the rents were considerably less. In country districts, for instance, the labour involved in erecting a building was much greater than it was in the city. In Glasgow the methods of building had been so much modified and altered that the cost of every particular item was reduced to the lowest possible point. Brickwork, concrete rybats, mullions, stairs and pavements were substituted for the dearer material—stone. Rubble from old buildings was used for the back walls of tenements. In the dressing of the stonework machine power had replaced hand labour; machines were now used which, at a very small cost, could do the work of eight to fourteen men. The hoisting of the materials and preparing of the mortar was done, for the most part, by steam-power. The actual work of the operatives had been so split up and specialised that the greatest possible amount of work was taken out of the workman.

They stated emphatically, as a direct contradiction of the statements already made to the Commission, that the policy of "ca' canny" was unknown in the building trade in Glasgow. They were of opinion that high rent was the direct outcome of land monopoly, and they were persuaded that if the municipality was ever to accomplish anything in this matter, it must secure the land in and around the city. Besides this, if the building operations which the municipality might undertake were to be a success, it must not let out the work to a contractor, but employ the labour direct. The point which they desired particularly to emphasise in this connection was that it had been their experience all along, while engaged on public buildings, that the contractors almost invariably scamped the work. They did not only regard the subject from their standpoint as operatives. They were also deeply interested in the housing problem as citizens and occupiers of houses. Land monopoly could not in itself cause rent to rise if workmen did not crowd into the city and compete for house-room. The reason why workmen came to the city where house-room was scarce and rents high was that they could not find work in the country. In their trade it was becoming every day more difficult to obtain employment outside the large cities. The cause of this was that those industries alongside of which their trade could only be carried on were being localised in the cities, so that they might be conducted at the lowest possible cost.

Statistics showed that the lives of city dwellers were eight years shorter than those of country dwellers. This side of the question had, therefore, a very direct bearing upon the housing problem. For where a man worked, there he must dwell. And while they did not believe it to be the duty of the municipalities alone to say where industries should be carried on, it was nevertheless necessary that this side of the question should be considered. The development and improvement of the tramway system might alleviate the present conditions. In going to and from their work they often found it very difficult to obtain the necessary car service. In the first place, the cars were run in many districts with evidently no regard to the starting or stopping hours of workmen. As a result of the route system, they found it very expensive travelling by the cars. The extension and improvement of the tramway system might for a time alleviate the evils, yet this expenditure of the citizens' money would, unless the municipality acquired the adjacent land, simply enrich the present landowners. They submitted, therefore, that the municipality should acquire land and erect dwellings fit for men to live in—dwellings, not in the vicinity of smoky factories or poisonous chemical works, but dwellings which men might consider their home. No one-apartment houses should be tolerated. Some of the remedies proposed by them were beyond the present powers of the municipality. Yet the evil effects of the present system were so far-reaching and the whole matter so pressing that they believed the municipality should endeavour to deal with the subject in a thorough and drastic manner. Referring to "jerry buildings," one of the witnesses stated that some of the most glaring examples of "shoddy work" were to be found in certain public buildings, which he particularised. The same witness added that the introduction of machinery in their trade meant harder work for the men.

INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE annual meeting of the above Society was held at the town hall, Kensington, on the 25th ult. Mr. William Weaver delivered the presidential address. He referred to the vast importance of municipal work and its effect upon national life and welfare as a whole. The continued growth and changes in the vast Metropolis presented, he believed, a grave problem

20 OLD CAVENDISH STREET, W., LONDON.

which, in a lesser degree, applied to many of our large towns. The changes during the last half-century were stupendous, and there was every indication that the next half-century would present a similar record. It was "the age of the engineer," and Mr. Weaver went into detail upon the wonderful progress made in such departments as water-supply, locomotion, roads, refuse removal, sanitation and lighting. As to locomotion, the President said that the partial or complete disappearance of horse traction would effect a vast improvement in the sanitary condition of the streets, would demand altered methods of road construction, and lead to the universal adoption of impervious pavements. With proper regulations motor traction should prove a great addition to the comfort of town residents, and the general adoption of such traction would be equivalent to widening the streets owing to the lesser requirements of the changed traffic.

Then followed a series of papers on technical subjects. The treatment of sewage is apparently an engrossing topic for the engineer, and such authorities as Professor Frank Clowes and Mr. Scott-Moncrieff were heard. The former gave the result of the experimental bacterial treatment of sewage as pursued by the London County Council. It is satisfactory to learn that under proper conditions a very uniform and satisfactory purification of sewage can be effected, and that the process is comparatively cheap. So important is the subject as regards the health of the community and the condition of the river Thames that the London County Council is now publishing a standard book containing an account of the experiments.

Mr. F. Smythe showed how public roads can be brightened and the air sweetened by the planting of suitable trees. In future there is no reason why some of our most desolate town thoroughfares should not be improved in this way, and he recommended the modern municipal engineer to add arboriculture to his list of studies. The plane is the finest tree for road-planting, and the next in order of preference are maple, sycamore, oak, poplar, elm, lime, birch, ash and willow. For manufacturing or smoky districts planes, Norway maple, sycamore, poplars and ash are the most satisfactory.

Mr. T. W. E. Higgins dealt with the importance of motor-vans for municipal purposes. Their employment would relieve the streets of many tons of horse manure and dispense with a

small army of scavengers. Mr. T. W. Aldwinckle read a useful paper on "Minimising the Risk of Fire in Temporary Buildings," and Mr. W. Nisbet Blair discussed "Cremation." According to figures quoted, cremation in England is making very slow progress. In ten years only 2,015 bodies have been cremated at Woking—the first crematorium in England. Ten years ago the total for Woking was 101, and last year it was only 275, as compared with 301 in 1900.

Lunch was provided by the Mayor, and later in the day a party of engineers proceeded to Earl's Court to inspect the complete exhibition of fire appliances.

NEW SCHOOL BUILDINGS, COSELEY.

THE memorial-stone of the new school for girls, cookery, laundry and woodwork centres, at Mount Pleasant, Coseley, Staffs, was laid on the 22nd ult.

The buildings will be an important addition to the educational machinery of the district. They are being erected upon sites immediately adjoining and connected with the existing mixed and infants' schools at Mount Pleasant. The new girls' school is for 350 scholars, and is placed with its chief elevation to Mount Pleasant Street. It has a large central hall and seven classrooms, together with cloak-room, lavatory and other conveniences. The central hall is effectively lighted by large clerestory and dormer windows, and the classrooms with boldly arched windows of fresh and original character. A central fêche is placed upon the main roof.

The block containing the cookery and laundry centres is situated upon the Ivy House Lane side of the site. There will be a large room for sixty cookery students, with scullery, cloak-room and lavatory attached, and another similar room for the accommodation of sixty scholars in the laundry department. This is provided with a drying-room and other requisite appurtenances. Upon the south-east, or boys' side of the site, the centre for the teaching of woodwork is placed. This contains a workshop, with cloak and lavatory accommodation.

The existing mixed and infants' school will be converted into a boys' department and infants' department, and will be generally renovated and properly ventilated. A compact and

convenient residence for the caretaker is put in a commanding position upon the site.

The style of the various buildings is an economical and inexpensive type of Renaissance. The materials are brick and stone, relieved by moulded brick strings and pressed arches and quoins. There will be tile roofs and wood-block and granolithic floors. The interior will have glazed brick dadoes. The ventilators are those of Messrs. Walters, of Wolverhampton, and the low-pressure heating apparatus is being installed by Messrs. Glydon, of Birmingham. The contractor is Mr. Henry Gough, of Wolverhampton, the amount of whose tender is 8,394*l*.

The whole of the work is being executed from the designs and under the personal superintendence of Mr. S. Henry Eachus, architect, of Temple Chambers, Wolverhampton.

LONDON COUNTY COUNCIL WORKS DEPARTMENT.

THE half-yearly return of the works committee of the London County Council, covering the cost of works completed by the works department during the half-year ended March 31 last, has been presented to the Council. It discloses some large and serious losses, but these are mainly in connection with the erection of Horton Asylum, Epsom, and the matter has already been fully discussed in the Council. The return deals with twenty estimated works, the final estimate for which was 591,790*l*, while the actual cost has turned out to be 638,534*l*, or a balance of cost above final estimate of 46,744*l*. On only four of the works is any excess of cost over estimate shown, but in these cases the excess is 56,535*l*. The cost of the building of the superstructure of the Horton Asylum has exceeded the estimate by 37,878*l*, the final estimate being 291,165*l*, and the actual cost 329,043*l*. The erection of a central electric-lighting station for the same asylum has resulted in an excess of cost over estimate of 1,977*l*, on a job estimated to cost about 14,000*l*. The provision of an "epileptic colony" on the Horton estate, as an adjunct to the asylum, has resulted in a balance of cost above estimate of 5,018*l*. The other loss, which amounts to 11,617*l*, is on the construction of the Hackney Wick relief sewer. This work was estimated at 125,329*l*, and has actually cost 136,946*l*. With regard to this work the committee do not think that the

ultimate cost is excessive having regard to the difficulty of estimating accurately. A great deal of difficult work was encountered, and much pumping was necessary. The remaining sixteen works embraced in the return all show a balance of cost below estimate, the aggregate saving amounting to 9,791*l*. The jobbing works executed by the committee during the half-year have resulted in a balance of cost below schedule value of 1,334*l*. In concluding their report the committee state that the number of works referred to them for execution and not included in the present return was forty-one, representing an estimated expenditure of, approximately, 739,000*l*, but they did not anticipate an excess of cost over accepted estimate in respect of any works where the accepted estimate was over 1,000*l*.

WORKMEN'S DWELLINGS IN LIVERPOOL.

AT a meeting of the housing committee of the Liverpool Corporation on the 20th ult., Mr. J. B. Colton presiding, the following report as to the cost of workmen's dwellings was presented:—"The special committee appointed by the housing committee beg to report that they have carefully considered Messrs. Mines & Sutherland's offer to build twelve three-roomed tenements of similar dimensions to those proposed to be erected by the city engineer with 'the old-fashioned bricks and mortar for at least 25 per cent less than the city engineer's price' of 1,230*l*, according to the plans and specifications submitted."

While the plans and specifications were under consideration Messrs. Mines & Sutherland pointed out to the chairman that all they had offered to do was to build a block of cottages of "similar size" to the engineer's concrete cottages, but not to a similar specification.

The committee are of opinion that it is not generally understood that workmen's cottages erected for the class of tenants for whom the Corporation seek to cater, viz the dispossessed, must be erected so as to comply with the requirements of the Local Government Board, and justify the sanction of an adequate period for repayment of loans.

The special sub-committee on examining the plans and specification came to the conclusion that cottages built thereunder would not be approved by the Local Government Board, and would be of no use to the housing committee. The buildings, which were to be of the cheapest possible structure, had

an estimated life of only thirty-five or forty years, even if occupied by a good class of tenant. The partition walls between the rooms were to be lath and plaster. The floors were to be thin boards on wooden joists instead of being laid on concrete with iron or steel joists, which is considered an absolute necessity by the housing committee. There was no provision for ash-shoots and bins as in the city engineer's scheme. There was no gas supply. There was no specification for balcony and outside staircase. No provision was made for paving the area at the rear or building boundary walls. All the rooms were 2 feet lower in height than the engineer's scheme.

The above are some of the principal defects in the plans and specification, and the committee accordingly amended and submitted the same to Messrs Mines & Sutherland for their consideration. The town clerk also sent Messrs. Mines & Sutherland a comparative note, pointing out the differences between their specification and that of the city engineer, in order that they could see what was really included in the city engineer's scheme and estimate of 1,230*l*.

On the 15th inst. Messrs. Mines & Sutherland wrote to the town clerk as follows:—"We regret we cannot see our way to build the workmen's dwellings at the price we tendered under the specification as altered by you."

The special sub-committee would point out that Messrs. Mines & Sutherland were not asked to provide anything that was not similar to or was not included in the city engineer's scheme.

TRAMWAYS AND BUILDING ESTATES.

At the Middlesex Guildhall, Westminster, recently, Mr. Walter Dowson, deputy under-sheriff of Middlesex, and a special jury, sat to assess the compensation to be paid by the London United Tramways (1901), Ltd, to Mr George Ralph Fitzroy Cole for the value of the freehold land and premises at Twickenham, which the company have compulsorily acquired in connection with their tramways. Mr Rawlinson, K.C., and Mr. G. E. Jones, instructed by Messrs. Crawley, Arnold & Co., appeared for the claimant; and Mr. Roskill, K.C., and Mr. E. Morten, instructed by Messrs. Stanley, Wasbrough & Doggett, represented the tramway company. The case was of considerable importance, inasmuch as a large portion of Mr. Cole's claim consisted of items for alleged depreciation to his estate at Twickenham caused by the advent of the tramways. The

properties acquired by the company were:—(1) A piece of land at the corner of Colesbridge and Cole Park Road, Twickenham, 475 square yards, of which 85 were included in the bed of the river Crane; (2) a small triangular piece of land $3\frac{1}{2}$ square yards in area, forming part of the Gables, London Road; (3) 650 square yards of roadside waste on the west side of Ivy Bridge, London Road; (4) 60 square yards of roadside waste on the east side of Ivy Bridge; and (5) a cottage in Oak Lane, Twickenham, with an area of 567 square yards, rent 25*l*. a year. Mr. Rawlinson stated that Mr. Cole's claim was under two items—one for land actually taken, and the other, which was a much larger item, for injurious affection to the Cole Park estate by the construction and working of the tramways. The amount originally claimed by Mr. Cole was 27,308*l*., and the amended claim 15,521*l*., of which 11,568*l*. was for consequential damage. Mr. George Frederick Sharpe, architect and surveyor, gave evidence to the effect that he had acted as surveyor to the Cole estate for seven years, and had assisted in the development of that estate. He considered the tramways had considerably depreciated the property. The first claims made by Mr. Cole, amounting to 27,308*l*., were put forward partly on his advice, and reduced afterwards to 13,000*l*.. His reason for this reduction was that the effect of the tramways had not been so serious as he had anticipated. Mr. Benjamin P'Anson Beach, F.S.I., a member of the firm of Messrs. Farebrother, Ellis & Co., Fleet Street, was also called on behalf of the claimant. His figures for the land actually taken amounted to 12,803*l*.. After Mr. Fitzroy Cole, the claimant and other witnesses had given evidence, Mr. Roskill, on behalf of the company, commented on the extraordinary nature of the claim, the original amount of 27,000*l*. being reduced to 13,000*l*.. No damage had been done by the trams. Mr. E. H. Bousfield, of Messrs Edwin Fox & Bousfield, stated that he had acted as surveyor and valuer to the company in the compulsory acquisition of these properties, and had amicably settled nearly every claim. This claim, too, would have been settled had it been in any way within reason. His figures were 683*l*.. He considered that the claim for consequential damage was absurd, as there was no damage whatever; the tramways benefited the estate rather than damaged it. Ultimately the jury returned the following verdicts:—(1) Cole's Bridge, 55*l*.; (2) the Gables, 5*l* 10*s*; (3) west side, Ivy Bridge, 132*l*.; (4) east side, Ivy Bridge, 16*l* 10*s*.; (5) cottage, Oak Lane, 55*l*.; consequential damage, nil—total, 759*l*., which included the usual 10 per cent.

THE WEEK.

THE address of the Earl of STAMFORD to the Congress of the Sanitary Institute on Tuesday was well adapted to the occasion. His lordship did not attempt to pose as a specialist, but he was successful in a task which specialists avoid—that is, in summarising what has been accomplished of late years in sanitation, as well as what remains to be done. There was also courage shown in pointing out in a manufacturing city like Bradford the necessity of a central authority to deal with the evils arising from trade effluents. The shortcomings of the Factory and Workshops Act were also described, and it was said that, owing to careless draughtsmanship and definition, the majority of workshops remain in a similar condition to that of the cotton factories at the beginning of the nineteenth century, when the law from its indefiniteness remained a dead letter. Mr. FITZMAURICE, in his address to the Section of Engineering and Architecture, was able to give some facts to prove the difficulty attending the housing problem in London. It was calculated that in some of the central districts a tenant would have to pay for a five-room tenement 6s. 8d. a week to meet the interest and sinking-fund charges on the capital required for the land, whereas in the suburbs the corresponding figure for similar accommodation would be 1½d. per week.

THE new Rector Magnificus of the Technical High School of Berlin, Professor GEORG HERMANN HETTNER, has gained reputation by his investigations in the higher mathematics. His appointment to the office shows that skill in practical engineering or manufactures is not the only condition required for the control of so important an establishment. The rector is a remarkable example of the professorial caste in Germany. His father, Professor HERMANN HETTNER, was a distinguished authority in literature and the history of art. He also served for many years as the Director of the Dresden Museum. One of his numerous books described his travels in Greece, which were mainly directed to the elucidation of subjects relating to art and archæology. A translation of it was published in Edinburgh, and few books of its class are so interesting and instructive. His eldest son, FELIX, who died in October last, was an archæologist, and was entrusted with the direction of some of the German explorations. Another son is a professor in the University of Leipsic. Professor GEORG HETTNER was born in 1854 at Jena, where his father was then professor. He taught in Göttingen and in the University of Berlin, before he was appointed to the Technical High School.

THE case of MILLAR, SON & CO. v. RADFORD, which was heard in the Court of Appeal, is of importance to all agents connected with the selling or letting of property. The plaintiffs were in 1900 employed to find a purchaser or tenant for a property in Surrey. The arrangement was not in writing, but the plaintiffs claimed that it was agreed by the defendant that they were to receive a commission of 5 per cent. on the rent in the case of letting, and in case of sale they should receive a commission of 5 per cent. on the first 1,000l. of the purchase money, 2½ per cent. up to 5,000l., and 1½ per cent. on the residue. A tenant was found who took the house on a lease for seven years and the plaintiffs were paid commission. About fifteen months afterwards the tenant purchased the property. The plaintiffs claimed commission on the sale, giving credit for the sum they had received. The defendant declined to pay, stating that the purchase was due to his own negotiation. At the trial Mr. Justice LAWRENCE said no evidence had been produced of the contract, and gave judgment for the defendant. The plaintiffs sought to have a new trial, partly on the ground that from the correspondence there was a continuous retainer of them. The Court of Appeal dismissed the application. The Master of the Rolls remarked that "the claim of house agents to be entitled to commission in circumstances like the present was a claim which was often made and was likely to continue to be

made. It was therefore important to point out that the right to commission did not arise out of the mere fact that agents had introduced a tenant or a purchaser. It was not sufficient to show that the introduction was a *causa sine qua non*. It was necessary to show that the introduction was an efficient cause in bringing about the letting or the sale. Here the plaintiffs failed to establish what was a condition precedent to their right to commission, viz that they had brought about the sale. It was open to the defendant in an action like this to say either that, though the plaintiffs effected a sale, they were not his agents, or that, though they were his agents, they had not effected the sale. If the defendant proved either the one or the other, the plaintiffs failed to make out their case." The decision is undoubtedly hard on the agents. It was understood at the time of letting that the defendant wished to have the sale deferred, and that the matter was left in the plaintiffs' hands. The case is, however, only a variety of a practice that is becoming general. People with property to let or sell are not satisfied with putting it on the books of several agents, but they endeavour to supersede them by acting on their own behalf. Much trouble is therefore gone through without the least remuneration, while the tenant or purchaser rarely gains any advantage, for he is not allowed the commission which should have been paid. For many reasons it is therefore preferable to deal with the agents.

THE competitive trials of wind pumping-engines which were arranged by the Royal Agricultural Society have an interest for others besides those engaged in agricultural pursuits. Water has often to be raised by wind engines for domestic supply as well as during building operations in the country. One of the conditions was that the engines should not exceed 4 b.h.p., with an actual wind velocity of ten miles per hour, and they were required to be erected on towers so constructed that the centre of the vane should be 40 feet in height from the ground level. Seventeen competitors took part in the trials, but there were twenty-two engines. The first prize was awarded to a Canadian firm for a machine which costs 70l., and the second to a Worcester firm for one which costs 77l. A description to the competing engines by Mr. F. S. COURTNEY has been published for the Royal Agricultural Society by Mr. JOHN MURRAY. The prize engines are economical in maintenance. It is not difficult to fix them, and they seem to be well adapted to builders' requirements.

ALTHOUGH there may be a tendency to litigation in Scotland it cannot be said that many actions arise out of the relations between architects and clients. Two cases springing out of one transaction which have been heard in the Sheriff Court of Ayr are therefore noteworthy, apart from the importance of the questions involved. Mr. W. W. REID, architect, Kilmarnock, sought to recover 156l. 18s. 2d., balance of fees due for designing a house at Monkton for Mr. DUNDAS HAMILTON. As a sum of 154l. had been received, the amount sought was about one-half the fees. Payment was refused on the ground that the architect had failed to perform his duties with reasonable skill and care, and that the defendant had sustained loss and damage to an extent exceeding the sum sued for. A cross action was taken by Mr. HAMILTON for the recovery of the large sum of 1,150l. for damages. It was said that Mr. HAMILTON had stipulated that the house was not to cost more than 2,600l., whereas the actual amount was 4,268l. It was also alleged that defective construction and inferior workmanship had been allowed, and in consequence of the delay in supplying working drawings great inconvenience was caused. Mr. REID explained that the original estimate amounted to close on 3,000l., but by lessening the size of the stable and modifying the decorations of the main house it was reduced to 2,600l. The cost would not have exceeded this sum if new work had not been rendered necessary by pursuer's interference while the work was in progress, and his frequent changes of mind as to what he actually did want. The Sheriff considered the allegations of Mr. HAMILTON to be too general and vague, and on that account dismissed the action. The architect's claim was considered to be proved.

FRENCH CRITICS AND ENGLISH PAINTING.

AMONG the numerous visitors from France who were encountered in London during the present week a large section, we hope, visited the English pictures in the National Gallery as well as those in the gallery at Millbank, which to some extent corresponds with their Luxembourg. It may be confidently asserted that the majority would be at least surprised. So many efforts are made to enable French people to realise the varieties of art, and France is so rich in examples, it would not be complimentary to suggest any deficiencies in their knowledge. But anyone who will take an impartial view of the public galleries in Paris and in London can have no hesitation in concluding that an ordinary Englishman has more opportunities to become acquainted with French pictures than a Frenchman with those of the English school. Although several French artists whose words carried weight with their countrymen have spoken most favourably of English work, their opinions did not count for much with the authorities of the Louvre. Fifty or sixty years ago it was possible to purchase examples by English masters at a moderate rate. But the prices of the pictures that could be regarded as really representative are now too exorbitant to be paid for out of the modest budget which the State assigns for such purposes. All the French pictures which we possess were not acquired out of public grants. The most interesting collection of modern examples is undoubtedly the gift of the late Sir RICHARD WALLACE. But however obtained, we have the materials which will enable a student to understand the characteristics of the French school from NICHOLAS POUSSIN to MEISSONIER.

There is the more need of a Frenchman making himself conversant with the numerous examples of English painting which are to be viewed at the National Gallery and at the branch establishment, because to some extent the old prejudices about English incompetency have not entirely lost their power. It is doubted whether there is an English school. The examples occasionally seen in international exhibitions in Paris were supposed to display exceptional ability, and to be picked to suit French taste. It is difficult for a stranger to realise that in the selection of such works favouritism counts for a great deal. The examples purchased by the donor of the Tate Gallery were not always of the highest class. But on that account they have their uses for strangers by revealing the average power of English artists. The accounts of English pictures which are written by Frenchmen commonly contain expressions of astonishment at the unexpected ability which they witnessed. We have no doubt that to any expert the humblest examples in Trafalgar Square or Millbank would also serve as evidence that English painting never descended so low as was imagined.

The surprise was quite natural if we remember the state of opinion on the subject. That most capable critic THORÉ, who wrote under the name of BURGER, said that the English school had not even entered into the history of art as it was taught on the Continent. The reputation of the artists was entirely insular. At that time, which is not half a century ago, there was not one picture by an English master in the Louvre. Indeed, it appeared as if the prejudice weighed so much on foreign intellects, men who otherwise were good judges were unable to consider English pictures on true grounds. MÉRIMÉE declared that HOGARTH could neither paint nor draw; that he was a comic poet rather than a painter, and it seemed to him incomprehensible that such a man would dare to write an "Analysis of Beauty," and still more extraordinary that a Frenchman could be found to make a translation of it. Now it is only necessary to look at his pictures in the National Gallery to learn that HOGARTH, apart from his subjects, was an excellent manipulator of colours, and he could apply them in such a manner that they continue to show more freshness than is visible in the works of men who believed they had acquired the Venetian and other secrets. Most of his paintings represent indoor scenes, and he has rendered architectural and other details with an accuracy that is remarkable. It is therefore absurd to affirm, like M. CHESNEAU, that the beauties of nature, the reflection of light upon the face of the clouds, and other phenomena of open air, never received the least attention from him, and on that account he was

not an artist and never more than a moralist. HOGARTH was a realist, and he introduced no unnecessary elements in his pictures. But if he had had to deal with landscapes he would have presented what he saw in as downright a manner as any modern realist. REYNOLDS, on the contrary, has been a favourite with French critics. THORÉ begged Lord HERTFORD to enrich the Louvre with the *Nelly O'Brien*, for in that gallery he said it would have enormous success, and would inspire French painters to make new combinations in their own works. Another picture which he wished to see in the same place was GAINSBOROUGH'S *Mrs. Siddons*, which THORÉ described as being a creation entirely singular in its incomparable originality. Among landscapists CONSTABLE was fortunate in captivating the French. VILLOT, who was the official critic and historian for the Louvre, called him "the MESSIAH of modern landscape-painting," and, if possible, DELACROIX and GERICAULT would have used a higher eulogium if one could be discovered. LAWRENCE was another favourite, and became so by the exhibition in Paris of his Byronic *Master Lambton*, in 1824. But it is dubious whether if the picture were shown this year it would receive any commendation.

One objection raised by the French critics is that English painters possess no general types of humanity, and no matter what the subject may be, whether scriptural or classical, they present figures which are unmistakably of the English race. That is a question which it is difficult to discuss. Idealising is certainly not much practised in England, and it may be that foreign eyes are able to detect resemblances which a native critic would pass over. It is beyond contradiction that in some successful modern pictures it is easy to recognise the models used for some of the principal figures. The painters make no secret of the aid they have received, and if they are silent their friends may be more communicative. But the attempt to be natural in that way has an irritating effect on a French critic or amateur. The caricaturists have created types of English people which are accepted as faithful, and it is concluded the figures in the paintings have an affinity to the humorous exaggerations of the satirical journals. The variety of faces, the characterisation, the truth of expression are disregarded because it is believed the best pictures are no more than portraits of Englishmen and Englishwomen in fancy dresses. The French claim to be the sole inheritors of the generalising faculty which belonged to the Latin race; whilst in England, on the contrary, individualism is omnipotent, and asserts itself not only in literature but in art.

It cannot be denied, however, that although not avowed, the aim of Frenchmen has been the attainment of a quality which is believed to be peculiar to Englishmen. The point at issue in the great contest between classicists and romanticists turned on it. Was it preferable to have characters which came very near to abstractions in dramas and romances, or those which were as peculiar as an author could devise? In "Hernani," "Ruy Blas" and "Notre-Dame" beings were introduced which would have horrified the playgoers and readers of the time of LOUIS XIV. They were, perhaps, as far removed from nature as the classic people of CORNEILLE and RACINE, but they had an excess of individuality which was believed to be enough to redeem their extravagance. The fight against the principles supposed to be rooted in the Académie des Beaux-Arts is another sign of the tendency. A winner of the Prix de Rome in painting must now possess extraordinary powers or he is doomed to failure. He is supposed to be imbued with the antique and academicism. That is taken to mean, in other words, his acquirement of stereotyped formulæ for treating different classes of pictures, and to set himself right with the critics and the public he is bound to make a formal show of revolt. Of course, Frenchmen would maintain they had no thought of descending to the English level. But all who have studied French exhibitions for twenty or thirty years can hardly fail to recognise a tendency which from its persistence seems to be unavoidable.

Every benefit has its drawbacks, and it is possible that the systematic study of works of art which is followed in France leaves impressions which are not always favourable to the young artist. The copyists of pictures in our

galleries never become remarkable for their own originality. Dead masters control their thoughts as well as their hand. CONSTABLE used to say that, when he sat down to draw a scene from nature, as the first stage in the composition of a picture, he took care to suppress recollections of all the land-scape paintings he had seen. He was not alone in seeking independence. One consequence of French practice is the greater ease in the classification of modern French pictures than of those by Englishmen. We can recognise the masters to whom French painters believed they owed allegiance, and we can use those masters as representatives of different classes. In England, on the contrary, there is no such recognition of authority. Every painter aspires to be an islet and to be as widely separated from former masters as from his contemporaries. His countrymen he knows wish to have his personality asserted. No doubt some Frenchmen have believed that every master followed a like course. As THORÉ said, it is CHARDIN himself we admire when we look on his representation of a glass of water, and the "je ne sais quoi" which gives delight in pictures is simply the expression of the peculiarity of the artist's own way of seeing things and not his recollections of the style of other men's works. It is no doubt hard for Frenchmen who have been brought up in a belief about the virtues to be found in various dogmas of art to realise the worth of the peculiarities which are visible in English pictures. It is only occasionally they are allowed the chance to see English work in their own country, and then the examples may not be the best of their kind. For that reason it is to be hoped they will use the present opportunity to visit London galleries in order that they may realise the true principles of English painting. If they conclude that the principles are defective, well and good, but in that case they will have judged by evidence, whilst at present the opinions expressed are generally derived from hearsay, or are based on illustrations which are unsatisfactory as representations of pictures.

SIR HENRY WOTTON ON ARCHITECTURE.*

IT would excite no surprise if an ordinary seventeenth-century tractate were reprinted, although the subject might be considered only temporary or polemical. But architecture, whether old or new, cannot be looked upon as appealing to the ordinary reader. It is therefore a compliment to the noblest of arts when we find a firm having the courage to reprint "The Elements of Architecture," by Sir HENRY WOTTON, which was published in 1624. It was not the earliest book on the subject, for in 1563, that is, five years before WOTTON's birth, "The First and Chief Grounds of Architecture," by JOHN SHUTE, appeared; there was a second edition in 1579, and a third in 1584. Little is known about SHUTE except that he was a painter and had the Earl of NORTHUMBERLAND for a patron, while WOTTON distinguished himself in public life as well as in other ways.

HENRY WOTTON was a scion of an old Kentish family, and was born at Boughton Hall on March 30, 1568. He was therefore a representative of one of the most famous English periods. He was four years the junior of WILLIAM SHAKESPEARE; seven years younger than FRANCIS BACON; he preceded BEN JONSON, who was poet and bricklayer, by six years, and INIGO JONES by four years. JAMES I., whom he long served, was only two years his senior. At Oxford he was recognised as a clever student. Foreign professors in England were then more common than now, and from ALBERICUS GENTILIS he acquired a knowledge not only of civil law and mathematics, but a mastery of the Italian language, which afterwards served him as a diplomatist. Possessing an independence, he adopted SHAKESPEARE'S theory that home-keeping youth have ever homely wits, and that a man cannot be perfect unless he has been tried and tutored in the world. He therefore spent eight or nine years on the Continent, of which five were passed in Italy. According to IZAAC WALTON, "he became acquainted with the most eminent men for learning and all manner of arts,

as picture, sculpture, chemistry, architecture and other manual arts, even arts of inferior nature, of all which he was a most dear lover and a most excellent judge."

On his return to England he was appointed one of the secretaries of the unfortunate Earl of ESSEX. When the differences arose between the favourite and Queen ELIZABETH, partly owing to the failure of ESSEX to subdue the Irish chiefs, WOTTON became alarmed. As soon as ESSEX was consigned to the Tower, WOTTON was too well conversant with the risks of secretaries to be indifferent to the value of an hour. He used all expedition to reach Dover, hired a vessel at a heavy cost, and succeeded in reaching France. The second secretary of ESSEX remained and was executed. WOTTON had therefore at least another year to study art and politics in Italy. He wrote a book on the political state of Christendom. Having become acquainted with a plot against JAMES, he lost no time in travelling to Scotland, and introduced himself to the Court at Stirling as OCTAVIO BALDI, an Italian diplomatist. When JAMES was secure on the English throne, he appointed WOTTON to be ambassador to the Venetian state. It was while on the journey he made the celebrated definition of an ambassador as "an honest man sent abroad to lie for the good of his country," a witticism which afterwards caused him some trouble. Indeed, it has been stated he was recalled in consequence of the words. He spent four or five years unemployed in England, then he was despatched on a mission to the United Provinces and afterwards to Venice. WOTTON had a platonic affection for the daughter of JAMES I., who had married the Elector Palatine, and he was sent several times as adviser to her Court. JAMES was not liberal with his ambassadors, and after twenty years of journeyings and changes of residence in foreign cities, WOTTON was a poorer man than when he started in the king's service. He was promised the reversion of the office of Master of the Rolls, but through his necessities he could not wait until the holder died. As a refuge he accepted the Provostship of Eton, which he held until his death in 1639. Those who wish to know more about him can consult the biography which was written by his friend, IZAAC WALTON, and, with those of DONNE, GEORGE HERBERT and HOOKER, form the series of which WORDSWORTH says,

There are no colours in the fairest sky
So fair as these. The feather, whence the pen
Was shaped that traced the lives of these good men,
Dropped from an angel's wing.

The edition of "The Elements of Architecture" which Messrs. LONGMANS have reprinted is the first, which was brought out in 1624, ~~in~~ about the time when WOTTON was in treaty for his provostship. To it has been added the dedication to the Prince of WALES, afterwards CHARLES I. There is also a note relating to the ease with which a painter can convert a crying to a laughing face. He points out "this coincidence of extreme affections I observe represented by HOMER in the person of HECTOR'S wife, as paynters and poetes have alwaies had a kind of congenialitie. . . . She tooke her childe into her fragrant bosome weepingly laughing." Although it might be expected that WOTTON, from the nature of his pursuits, would give little attention to poetry, there is enough to show that like so many of his contemporaries he was impressionable to its charms. Some prefer his short poems to his grave treatises. In the last year of his life he wrote a letter to JOHN MILTON, in which he says, "I should much commend the tragical part if the lyrical did not ravish me with a certain Dorique delicacy in your songs and odes, whereunto, I must plainly confess to you, I have seen yet nothing parallel in our language." The words continue to be true, for after two centuries there is no rival of the class it represents to "Comus."

The tract on architecture, with others on education or moral architecture, a parallel between the Earl of ESSEX and the Duke of BUCKINGHAM, form the "Reliquiæ Wottonianæ" collected by IZAAC WALTON in 1651, and of which four editions were issued in the seventeenth century. The collection wrung praise from so cantankerous a critic as CARLYLE, who observed:—"His good old book deserves new editing, his good old genially pious life a proper

* *The Elements of Architecture*. Collected by Henry Wotton, Kt., from the best Authors and Examples. (London: Messrs. Longmans, Green & Co.)

elucidation by some faithful man." It is so excellent a miscellany we wonder it has not been often reprinted. Our business, however, is with one part of it, "The Elements of Architecture."

It would be interesting to discover the history of the book and the motives which inspired the author. It could not be asserted that the twenty-four years of the seventeenth century which had elapsed before the publication were entirely wanting in architecture. It is well to remember that the art was to some extent made illegal, and was therefore hampered in its exercise. Both ELIZABETH and JAMES had prohibited the building of new houses within three miles of London. It was preferable to authority that residences should be scarce than that the price of food should be raised through the increased demand for it, or that through the additional sewers the Thames should be rendered less agreeable to those who took pleasure in barges or boats. But London could show as examples of seventeenth-century architecture Staple Inn, Northumberland House, Zion House, King James's College in Chelsea, the Rolls Chapel and House, Camden House, Old Somerset House, the Queen's House, Greenwich; the Banqueting Room, Whitehall; Holland House, Kensington; and in the country, Crewe Hall, Audley End, Aston Hall, &c. Some of these evince foreign influence, but the majority were designed by Englishmen who carried on the old tradition and were indifferent to any reputation which was not local. It was, however, a time when native work was brought into competition with foreign; and thus about the same date we see Moreton Old Hall rebuilt in the half-timbered style that was familiar in Cheshire, and a start made with Audley House, Audley End, Essex, which shows Italian inspiration. WOTTON, we suppose, believed the period was ripe for the production of a book to embody the results of some of his studies in Italy. It might be thought that as the new philosophy was then occupying men's attention he should endeavour to act in the spirit of it and to promulgate the law of liberty rather than of convention. But possibly the whilom secretary of ESSEX was unable to admire anything which came from BACON, the weak man who was indebted to ESSEX for so much and who displayed his gratitude by bringing about the execution of his patron.

Whatever might be the cause, WOTTON declared that "our principal master is VITRUVIUS," whose felicity it was to write when Rome had attained the summit of power. Then we have such reverence for authority as is seen in the adoption of the advice of LEON BATTISTA ALBERTI, that all the timber used in a building should be cut from the same forest, and the stone out of the same quarry. Enormous heights of six or seven storeys in buildings were to be avoided. Even the determination of the depth to which foundations should be carried was supposed to depend less upon discretion than upon rule. PALLADIO advised a sixth part of the height of the fabric, and WOTTON appeared to think there was wisdom in the ratio.

The poets had made much use of the human figure as a standard for many things. The Tuscan pillar was therefore treated as a sturdy, well-limbed labourer homely clad. The Doric was a little trimmer than the Tuscan. The Ionic had much of the matron, the volutes being not much unlike women's wires in a spiral wreath. The Corinthian, lasciviously decked out, was like a courtesan. In spite of what VITRUVIUS said, WOTTON considered the entasis of pillars made them appear as if they were sick of some tympany or dropsy. Semicircular arches he held to be the securest, but the most graceful were those which, keeping the same height, shall be extended one-fourteenth part longer than the diameter. Gothic arches WOTTON despised on account of the natural imbecility of the sharp angle and their uncomeliness. He believed they ought to be removed from judicious eyes and left to their first inventors, the Goths or Lombards, amongst other relics of that barbarous age.

The endeavour to obtain a universal principle which could be applied to all manner of buildings is suggested by what is remarked about doors and windows. LEON ALBERTI, as a follower of PYTHAGORAS, determined the comeliest proportion for breadths and heights, reducing symmetry to symphony, and the harmony of sound to a kind of harmony of sight after this manner. The two

principal consonances that most ravish the ear are, by consent of all nature, the fifth and the octave, whereof the first riseth radically from the proportion between two and three, the other from the double interval between one and two or between two and four. If these proportions be transported from audible to visible objects and apply them as they fall fittest (the nature of the place considered), namely, in some windows and doors, the symmetry of two to three in their breadth and length, in others the double as aforesaid, there will, said WOTTON, indubitably result from either a graceful and harmonious contentment to the eye. A frank light can misbecome no edifice, temples only excepted, which were anciently dark, devotion more requiring collected than diffused spirits. Yet a house must not be made all eyes, which in northern climes would be too cold, in southern too hot; besides, there is no part of a structure more expensive than windows or more ruinous, not only as being exposed to all violence of weather, but because consisting of so different and unsociable pieces as wood, iron, lead and glass, and those small and weak, they are easily shaken.

The English houses which could be considered ancient were not ashamed of chimneys. But WOTTON held the Italians to be the best councillors on the subject, for they taught how gracefully to disguise the shafts of chimneys. He is, however, more of an Englishman when he mentions that, according to PALLADIO, the ancients warmed the rooms from secret pipes that came through the walls with one common furnace, and the arrangement might be preferred before our own. He adds:—"If the very sight of a fire did not add to the room a kinde of reputation, as old HOMER doth teach in a verse sufficient to prove that himself was not blinde as some would laie to his charge."

He recommends that all who contemplate building should not be attracted by any drawing on paper, but should have a model of the whole structure and every parcel or partition of it in pasteboard or wood. It should be as plain as possible without colours or other beautifying. For a structure which is to cost 40,000*l.* or 50,000*l.*, at least 30*l.* ought to be expended on an exact model. This may appear to be in keeping with the advice of SHAKESPEARE. But did both writers mean the same thing? WOTTON's model resembled one of those which are sometimes seen in the Academy and elsewhere, but SHAKESPEARE says, "we first survey the plot, then draw the model," and if we find the cost too high "what do we then but draw anew the model in fewer offices." "Henry IV.," in which the lines occur, it is believed was produced before 1599, and the dramatist's description of practice was therefore earlier. The question has interest because it is possible that models of buildings were not employed until they were imported from Italy, or were more common in WOTTON's time than in SHAKESPEARE'S.

The second part relates to the decoration of buildings by paintings and sculpture. There was a fear of those arts at the time as aids to superstition. But, as WOTTON shows, even the highest and most perfect endowments of nature can be misapplied, "as beautie in a light woman, eloquence in a mutinous man, resolution in an assassinate, prudent observation of houres and humours in a corrupt courtier, sharpeness of wit and argument in a seducing scholler, and the like"—words which epitomise the causes of many political transactions in that age.

The new edition of "The Elements" is an excellent example of modern printing. There are only 350 copies of the edition. The little book is worth preservation on account of its appearance, and to all who love architecture it is valuable as an indication of the endeavours to express "with the freedome of a plaine Kentish man" a system of aesthetics at a time when the subject was in a state of obscurity exceeding that which now prevails.

Mr. Ernest Rüntz informs us that in consequence of the death of Mr. Albert C. Breeden, one of his partners, he has altered the style of his firm from Ernest Rüntz & Co., architects and surveyors, to Ernest Rüntz & Ford. Mr. Geo. McLean Ford, A.R.I.B.A., who has been associated with Mr. Rüntz for upwards of twelve years, is now his sole partner. We are also requested to inform our readers that Messrs. Ernest Rüntz & Ford have opened branch offices at Lewes, Sussex, which will be under Mr. Rüntz's personal supervision.

THE CONSULTING ENGINEER.*

I WISH to speak to you a little about the duties and work of an engineer after his academic work and practical training is over; when, in fact, not only you yourselves, but also your employers, think that you are really useful members of society. Roughly speaking, the work of engineers may be divided more or less into two sections, which for general purposes may be called manufacturing engineering and consulting engineering. It is not the case, of course, that everybody comes exactly into one or other division, but practically everybody's work tends more or less to one or the other side, and is chiefly connected with it. As between these two sections of engineering work I do not make any comparison whatever. They are both, it seems to me, absolutely essential, and, so far as I can see, are both equally dignified. I myself happen to belong to one of them, the consulting division, but, as is the case with nearly every consulting engineer, a most essential part of my training was passed in the works of manufacturers, and among consulting engineers who are connected at all with mechanical work, a man is absolutely no good unless he has passed a very considerable time in manufacturers' shops of some kind or other. But in what I have to say to you I will refer more particularly to what I know most about myself—the consulting branch of engineering. Among engineers who may be called "consultants" I would include not only men who work independently, like myself, but also the great army of borough engineers of all classes, of engineers to municipal works of every kind, and of engineers to companies or firms who are not manufacturers. All these men, although they are not strictly consulting engineers, at least belong to a class distinct from manufacturers, and it is their kind of work which I know most about and desire to speak of. Their business is generally to scheme out plans for carrying out works; to draw up the specifications in which these plans are, or ought to be, described; to superintend the work as it goes on, and in general to formulate what they or their employers want to be done, and then to see that it is properly done. Very often besides they have the interesting experience of being actually users of the works that they have schemed out.

Lawyers and doctors, who belong to the other two great professions which we, as engineers, wish to emulate in certain respects, are, through their societies, fenced in by all sorts of rules and customs (beneficial on the whole, I imagine), which taken altogether form a very rigid code of professional procedure. But engineers have no such professional organisation at all. Of course we have the various professional institutions, including at their head the Institution of Civil Engineers, to which I hope you will all in time belong. But none of these institutions take cognisance specially of professional procedure or behaviour. Nor can a college course or a pupilage possibly deal with such matters, and so it is rather about these things that I would like to speak to you; there are no text-books on such subjects, and it takes a good many years to find them out. A good deal of what I have to say affects engineers equally whether they are going to be manufacturers or not. But the manufacturing point of view is necessarily different from my point of view, although the two are not antagonistic.

The main duty of a consulting engineer, the sort of thing he spends his time on, is the formulation of what one may call "schemes." A corporation wants a water supply or a gas-works, or a company a big manufactory; a railway, a bridge, or a design may be required for a tramway or other power-house or for an electrical transmission scheme. The engineer in such a case has not himself to design machinery, nor generally to design the details of anything, although he may have to design a general scheme of very great complication. His real work is to get out such a scheme in general outline; and almost the first point he has to consider, beyond and along with the actual engineering part of the work, is a financial one. He finds himself at once face to face with the question of cost; and one of the most essential parts of an engineer's work is the consideration of what a thing will cost, and whether it will pay to carry out. He may be fortunate enough to receive instructions to carry out certain work entirely independent of what it is going to cost, but in that case it is desirable to have this stated in writing beforehand, so as to prevent any question being raised afterwards. Personally I have never been fortunate enough to come off that way. More generally your directors will say to you, "Tell us first whether it will pay to carry out so and so, and if so, how best to carry it out." The question as to whether a thing will pay is influenced by a great many conditions." It is influenced first by the immediate cost, which is not a very serious matter to arrive at by estimating. A much more difficult question, you will find, is to arrive at the conclusion whether certain variations, certain improvements or certain alterations, which will cost money, will really yield a profit if carried out; and here come in certain pitfalls which I

would like to caution you against, because I know that sometimes they are very troublesome. There may be two ways of doing a thing, of which one costs 20,000*l.* more than the other, and the one which costs 20,000*l.* more is the "better" way. The engineer's business, however, is not necessarily to do it in the better way, his first business is to find out whether that way is going to pay; and if that additional 20,000*l.* is only going to save 500*l.* a year he had better not ask his directors to spend the money. This is a question which crops up continually. For example, in the case of a power-house there may be a question of using condensing or non-condensing engines. You know that if you use condensing engines you may save 15 per cent. or thereabouts of your fuel, and therefore condensation is "better" than non-condensation. But you must look at the matter not only from the engineering point of view, but also from the financial. I have a case in my mind in which the actual cost of condensation—which could be carried out very well—was something like 30,000*l.* for a certain power-house. If that 30,000*l.* is going to entail capital charges of 1,500*l.* a year, the question is whether the 15 or 20 per cent. of the coal bill is, or is not, worth that amount. It may be "better," but it may not be in the least worth while doing unless it is followed by a true and actual saving. I put down in a large power-house, some years ago, plant for superheating the steam, which works most successfully and without any trouble whatever. When I came to put down another station in the same city I naturally inclined to do the same thing again. First, however, I decided to run my first station week about with the superheating and without it for awhile. In this way I found that the difference in fuel amounted to about 6 or 7 per cent. of the coal used. The coal cost me 7*s.* a ton, and it was only a question of arithmetic to see whether I was at liberty to put superheaters in the new station. The result was that I did not put them in. Questions like this are not, of course, matters that one can say anything of in general; they must always depend on a particular place and particular circumstances. If an engineer can get coal at 7*s.* there are many things not worth while doing which would be desirable or essential when his coal costs him 25*s.* a ton or thereabouts. Every case has to be judged on its own merits.

There are one or two popular delusions on subjects of this kind which I may mention. They resolve themselves into purely financial questions, and an engineer should not only be able to deal with them, but should also make it his business to deal with such matters. There is sometimes a great cry about the transmission of power from coalfields; it is said that we ought to be able to utilise the resources of our coalfields on the spot and transmit electric energy, say, 200 miles away. It is a very pretty idea, and there is no difficulty in carrying it out; but it is, unfortunately, entirely a question of cost. I have never myself come across a case in which it was worth while, from the economical point of view, to carry out a long transmission of that sort. Although no doubt such cases exist, they are certainly very few. You must not be led away by a scheme just because it sounds attractive; the matter is really one only of pounds, shillings and pence. A similar thing, also very much talked about, is the utilisation of water-power, and this also is really a financial matter, in which every case has to be judged on its own particular merits. The actual capital expenditure for any such scheme is always very large, and is also very nearly independent of the number of hours per day during which the power can be utilised, that is to say, very nearly independent of the load factor—the capital charges are as great if the power is only to be used for six hours per day as if it were utilised continually day and night. If the engineer has to work out an arrangement of this kind which can be worked for only eight hours a day, he will almost certainly find that the capital expenditure is the same as if the plant were to be worked three times as long, and therefore the capital charges will be enormous in proportion. You will find that all the great water-power work which has been a success has been so because it has been supplied to works where the energy could be utilised pretty nearly all the twenty-four hours, and the capital charges distributed accordingly.

After the engineer has worked his scheme out and has satisfied himself that it is going to pay, his next duty is to prepare his specifications, and that is a matter of no small difficulty. I am not going to recite to you model clauses out of a specification. But, speaking generally, the first thing is that the specification ought to be perfectly clear and perfectly complete, so that any person tendering to it may know exactly what he is tendering to and what he is expected to do. If the contractors do not do this it is quite certain that there will be trouble before the end of the work. If you have left anything out of the specification your employers will have to pay extra for it, and extras have a way of costing very much more than if they were included in the specification as a part of the original work. To avoid trouble about extras, the specification must be not only clear, but thoroughly complete. But although it must be very complete, it must on no account

* An inaugural address delivered at the City and Guilds Central Technical College by Dr. Alexander B. W. Kennedy, F.R.S.

be too detailed. If you specify the size of every bolt and nut, and so on, you take responsibility out of the manufacturer's hands, you make it exceedingly difficult for him to use his own methods and his own patterns, and in the end your employer has probably to pay more for his work, without the work itself being any better. On the other hand, you should specify what you do want with such completeness that the firms tendering may understand exactly what they have to tender for, and so that afterwards no claim for avoidable extras can possibly be made. Of course (and it may frequently happen) if you put in their specification something out of the way, something unusual that you want done, and which you have not seen done before, it is eminently desirable that you, as consulting engineers, should work out in detail some way of doing it, and include this in the specification. It is only fair to the contractor, if the engineer is proposing something new, to indicate that it has been worked out. Otherwise you may be at once met by the statement that it cannot be done—that no fellow ever did it; and this cannot be said if it is clear that you know at least one way in which it can be done.

Of course it may occasionally be necessary (I hope it may not be necessary in your experience) to issue a kind of open specification. I have seen a sheet of foolscap which purported to be a specification for three-quarters of a million worth of work. But remember that if an engineer asks a contractor to work to a "specification" of that kind he makes a very damaging admission of his own ignorance, and also practically puts himself in the hands of the contractor throughout the construction of the work.

If your scheme can be carried out, to your knowledge, in various ways by different good manufacturers, then let the specification say quite fully and clearly what conditions the work must fulfil, and say it in such a way as not to limit anything to the methods of one particular manufacturer. If you positively intend that A., B. or C. are to carry out the work you should say so at once, and not give other contractors the trouble of preparing tenders which you know beforehand will not be accepted. If you expect to get tenders in for things which can be made in different ways, equally good and equally to your specification, from different people, then let the specification be so worded that all these people can fairly and honestly undertake to do what they have been asked to do. On the other hand, you must not on any account let yourselves be persuaded by a manufacturer that a thing cannot be done if you think it can be done. A manufacturer's evidence that a thing can be done is often final, at least if he has done it already; a manufacturer's evidence that a thing cannot be done is purely negative evidence; it merely means that he does not know how to do it.

I may mention another very important point about specifications. It is very common to ask in a specification what a contractor will "guarantee." This sounds forcible, but in too many cases it really means nothing whatever. You ask a manufacturer what steam consumption he will "guarantee" for his engines, and he tells you he will "guarantee" 10 lbs. per indicated horse-power. If this is all, the guarantee is after all only so many words on a piece of paper. A guarantee, if it is to be of any use to you or your clients, must be accompanied by some conditions as to its enforcement, and also must be accompanied by information as to the experience on which the guarantee is based. I have more than once found that the only basis for a guarantee of economy was that some other manufacturer had been known to reach it, and "therefore" the manufacturer in question, being quite as skilful, could reach it also. What I particularly want to point out is that a guarantee is not a guarantee at all if it is unaccompanied by the evidence on which it is based, and by conditions for its enforcement.

Another matter, which sometimes causes difficulty, is the form of the arbitration clause which every specification contains. It is not uncommon to state in that clause that the engineer himself is to be the arbitrator, but I certainly advise you against this form. The engineer naturally believes he is right if there is a dispute, and stands up for himself as a party to the dispute, and it clearly is not fair that he should also be the arbitrator; and there have been many cases in which a manufacturer has gone to the courts under the circumstances and obtained the appointment of a new arbitrator. It is very much better to say that the engineer's decision is absolutely final on certain technical points on which he must be the only judge, but as to the interpretation of clauses or other general questions to fix on an outside arbitrator. Personally, I always use the formula that "the arbitrator shall be nominated by the President of the Institution of Civil Engineers," which insures that a competent and impartial man will be appointed.

After your specifications are out and tenders are received, your next duty is to advise as to which tender should be accepted. This is one of the most difficult, as it is also one of the most important, of the duties of an engineer. Perhaps the only general principle you can go on, supposing the tender to have been entirely open, is that you should advise that the

lowest tender among those which are absolutely satisfactory be accepted. You may often receive tenders from the most extraordinary people, people who have never done similar work before, as well as from firms who are thoroughly experienced and capable of doing it. You may have the unpleasant duty of eliminating the lowest tender, or the half-dozen lowest tenders, simply because the tenderers are not competent to do the work, and because you think your employers would lose more money by employing an inexperienced contractor than they would nominally save on the price. Every set of tenders has to be considered on its own merits, and I wish you joy of the work when it comes to you.

Now as to the position of the engineer after the scheme has been prepared, the specification drawn up and a tender accepted. The business of yourselves and your staff is, of course, to see that the work is carried out to specification; that is the first matter, and that sounds quite easy. If your specification has been really a good one it is not very difficult, but if your specification is at all doubtful on certain points your troubles are just going to begin. But assuming that you have, as no doubt anybody who has come out of this college will do, prepared a specification which is everything that could be desired, then you will find that on the whole, with a sound contractor, matters will go smoothly. But the consulting engineer must always remember that he is really to a certain extent in the position of an arbitrator between his clients and the manufacturers. He has first to see that his employers get what he has specified. On the other hand, he has to see that the manufacturers, the contractors who are working for him, are fairly dealt with; and it is not always very easy to hold an even hand in these matters. For instance, the contractors carrying out the work undertake to make it in so many weeks. But they are behindhand, perhaps because the work of some other contractor interferes with their progress, or perhaps because the weather is outrageously bad and they have to stop work. They demand a time allowance of two or three weeks; this is a point, of course, which occurs frequently. The engineer must not harden his heart beforehand and say right off that no allowance is possible. He really has to look at the matter as if he were a judge, and to consider fairly whether the contractors, in view of the terms of the contract and the facts of the case, are entitled to this allowance or not. Do not put yourselves in the attitude of always demanding your pound of flesh even if you are entitled to it. Of course there are occasions on which you must insist on absolute compliance with the specified conditions, but even in these cases your position for enforcing compliance will be much stronger if you have honestly tried to look at the matter on both sides before making up your mind. Your position as civil engineers demands that you should be absolutely just to both sides, even although one side is your own client. Of course a great number of very difficult cases come up, and you will be worried by them just as everybody else has been. You will find that the contractor has not worked exactly to specification in some of the general clauses which prescribe excellence of material and workmanship. A particular casting is not perfectly clean, perhaps not perfectly sound. If you have reason to think that the defect is a source of weakness or danger, you must reject it. But often you cannot go so far as this; the defect may be real, but may be only superficial, and the rejection may cause your clients much inconvenience by delay. Then comes your discretion as to keeping the defective work or rejecting it, a question then mostly of common sense in each case. On the other hand, you may have something not nearly so simple as this: there may be some little error in lining out or in erecting, insignificant in itself, but a potential cause of serious trouble. It is not the mere size of the defect, and not the mere existence of a deviation from the specification, that you have to take into consideration; it is the practical importance of the defect, or the possible result of the deviation, which has to determine your action in the matter.

There is another trouble which you will have to face. (Your life is going to be full of all sorts of troubles when you leave college.) Very few corporations or boards like the idea of spending money before it has got to be spent. It may, therefore, often happen that you get instructions at such a date that there is very little time for you to scheme the work, and very little time for the contractors to carry it out. You specify that everything shall be ready, say, by January 1. The contractor is late—he always is. By hook or by crook you get a portion of the machinery ready, and start working; probably you must start working. After the machinery has been in use, perhaps, six months, you find that it is by no means satisfactory. But it has actually been running, and you have had the beneficial use of it for six months. You are then I am afraid, in a dilemma. We all of us know the difficulty. You have had to use the machinery; and the contractor knows perfectly well that you cannot take the machinery down, but must go on using it. When the question comes of the terms on which it is taken over, or the deductions which may have to be made from the price, you are face to face with a matter not

easy of solution, and one which requires all your firmness of mind and balance of judgment, in order to find the right course.

I have said that I drew no comparison between the two classes of work, manufacturing and consulting—the experience of one is very different to the experience of the other, and it is as well for everybody on both sides of the fence to keep this in mind. I have not infrequently found that a manufacturer, who knew perfectly well that he could design a better machine than I could design, deduced from that the conclusion that he knew better what kind of machine I wanted than I did myself. But that does not really follow, for many reasons. Among others is the fact that as a consulting engineer I probably have to use the machines—the manufacturer does not use them, he makes them; he hears about them afterwards if they go very far wrong, but not otherwise. We have to use the machinery, and we know how it works in a way which very seldom comes within the manufacturer's cognisance. Moreover, we in our position as consulting engineers have quasi-confidential information from perhaps a dozen makers of each type of machine as to their different methods and results. This information is in our possession because we have received offers and tenders from different people for that particular kind of machine. The individual manufacturer does not always know the details of how other people make their machines. The experience and knowledge of the engineer and the manufacturer are quite different, and they must not be confounded. More than once manufacturers of the highest rank have proved to me absolutely that the things I wanted could not be done, at least not with any satisfaction, and that it was of no use asking for such things, while I have known all the time, not only that the things could be done, but that they had already been done with complete success. In this way there are many matters about which the consulting engineer may really know more than the manufacturer of the very things in question. This is, of course, no special credit to us; it is merely because the knowledge comes to us from other sources. But you must never on any account accept the negative opinion of a manufacturer as final, as I have already said. On the other hand, you must never underrate a manufacturer's knowledge of the details of what he does himself. There are some things of which I fancy I can design the details as well as any one else. (It may be only fancy.) I obtain tenders and drawings of these very machines from various manufacturers, and these tenders fulfil the essentials specified, but in such cases I have often thought that I could improve their details, and have said so without hesitation. If the manufacturer accepts my suggestion, well and good, but if (as is usual) he either points out why he has not adopted it, or simply says that he prefers to leave the thing as he has always made it, I think it is wise to accept his opinion, which may well be better considered than my own. There are probably ten different ways of making every detail, and it is really difficult to prove that any one is very definitely better than the others. I advise you never to try to make a manufacturer alter details with which he is quite satisfied merely to satisfy a fad of your own; it will not help you in the end. If you want to have a happy life as consulting engineers you must take advantage of all the knowledge and experience of the contractors who are carrying out your work, and be ready to add to this all the experience that you can get on the other side yourselves.

There are still two or three matters about which I would like to speak to you, although it is with some hesitation that I do so. It has happened in late years, especially in connection with electrical work, that a great many very young men have been fortunate enough to get into positions of considerable responsibility, with the drawback that, in the nature of things, they have not had that knowledge of engineering procedure and that knowledge of the world which is only to be bought by the misfortune of old age. I am afraid that in some cases the want of experience has led to undesirable results. In the first place, it is a very dangerous thing for you to own any patents in your own line, no matter how ingenious they are, if you are going to take to consulting work. You cannot put a patent of your own in your specifications, and you cannot use it at all without disagreeable things being afterwards said. If you are going to advise the use of things to other people you cannot, as professional men, advise the use of things out of which you are going to make money, and it is very undesirable on many grounds, therefore, that you should be the financial owners or the beneficial owners of such patents. Of course, if you are the engineers to works the matter may be different, although in every case it requires to be definitely arranged with your directors; but if you are general consulting engineers it is most undesirable for you to have patents in your own line.

If you are consulting engineers also you have absolutely no business and no right to be interested in any way whatever in any manufacturer's firm from whom you can possibly buy anything. Many of the manufacturing concerns are limited companies, and sometimes it may be very tempting to take up shares in them when you know that their work is good, but

clearly it would not do for anybody who was going to specify work to be a shareholder in a firm who might possibly tender to his specification. However free from prejudice your mind might in fact be, it is necessary for you not only to avoid wrong, but also to avoid even the appearance of it.

There is yet another matter which perhaps I ought to mention. There is a very strong temptation to a young man conscious not only of his own merits and ability, but conscious also that he wants to get married and to make money, and that as yet he is known to but few people—to, in one word, tout round for business. That is a thing which must not be. There is, unfortunately, no definite rule, as in the legal and medical professions, against it, but everybody who has done so will be sorry afterwards. It is, of course, a very undesirable thing that business should not come your way, but should go to some other fellow who is not nearly so clever or virtuous as you are. I hope that such experience will not be yours; but even at the worst, you will find it the best policy in the long run (to put the matter on the lowest basis) to do nothing in your own profession which would not be tolerated in any of the other great professions with which we wish to feel ourselves on an equality.

In conclusion, only one more word. In this profession to which we are all proud to belong, let us try to act as if its dignity were just as ample as the dignity of the Law, as if its necessity were just as great as that of Medicine, and as if its ethics were the ethics taught by the greatest of teachers and practised by the most worthy of men. If you carry out your work on that basis, after the scientific foundation which you have received at this college and the practical training which you will obtain no doubt elsewhere, our profession will be the richer, and may even be better, for having you as members, a result to which I trust we may confidently look forward.

PREHISTORIC REMAINS, STRANRAER.

THE explorations of a prehistoric settlement near Stranraer, Wigtownshire, conducted last summer by Mr. Ludovic MacLellan Mann, of Glasgow, F.S.A.Scot., and described by him preliminarily at a recent meeting of the Society of Antiquaries of Scotland, have been resumed. Mr Mann had the advantage of the co-operation of Mr. J. Graham, Callander, F.S.A.Scot. Some further noteworthy facts have been disclosed which throw a flood of light upon the method of house construction and architectural devices in vogue in the Scottish area during a very early period. No stone had been employed in the building of the houses and the dimensions of the huts were surprisingly small. The flooring had undoubtedly been many feet lower than both the present and prehistoric surfaces of the ground, and had been supported on a carefully and massively constructed foundation of pointed wooden logs placed closely together and more or less perpendicularly set. One of the houses had more than sixty of such logs in its foundation. The wood used was birch and oak, and most of the stakes had been placed in position contrary to the direction in which the branches had grown. The sharpening of the points had been done with some blunt-edged tool. Over traces of the flooring were evidences of a hearth, and many implements and utensils of stone and pieces of pottery were recovered. Unmistakable evidence of the nature of the walls was fortunately obtained. The walling had consisted of wattle-work, many of the twigs and branches being curiously placed upside down. Traces of an entrance passage, it was thought, were also observed. The woodwork was in a much better state of preservation in the lower soils owing to the greater amount of moisture there. The pottery, which is very coarse, dark and hand-made, is of the most interesting description, as it lacks the ornamentation characteristic of the Bronze Age culture, but bears a striking resemblance to the few known specimens of the ware of the Scottish Stone Age, several examples of which may be seen in Campbeltown Museum and in the National Museum of Antiquities, Edinburgh. A full report of these unique discoveries is in course of preparation.

The parish church of Boddington, Northants, an excellent specimen of well-preserved fourteenth-century architecture, has just been judiciously restored. The walls have been stripped of plaster and the joints repointed; there is a new belfry floor, and the font has been raised on steps; the bells have been rehung and quarter turned, while one has been recast; a cement gutter has been placed round the church, and the walls of part of the church have been underpinned, while new altar hangings, designed by Mr. C. A. Ford Whitcombe, of London, have been provided. The work has been executed under the supervision of Mr. M. H. Holding, of Northampton. The cost has been about 400/.

NOTES AND COMMENTS.

THE eleventh international congress of hygiene and demography will be held in Brussels from September 2 to 8, and will be under the patronage of the King of the BELGIANS and the honorary presidency of Prince ALBERT. Professor PUTZYS, of Liège, is the secretary. The subjects which will be discussed in the third section are purification of sewage, drain waters and those derived from manufactories; different systems of sewers; treatment of water derived from calcareous soils; hygiene of streets and roads; rules which should be followed in houses and cities; progress during twenty years in heating and ventilation of private and collective buildings; hygienic regulations which should be observed in the planning, aeration and interior decoration of dwelling-houses. Among the experts who will take part in the proceedings of the section are Mr. GILBERT FOWLER, superintending chemist of the sewage works, Manchester; Dr. RIDEAL, vice-president of the Society of Public Analysts, London; Mr. ALLEN HOWE, conservator of the Museum of Practical Geology, London; Mr. HORACE WOODWARD, of the Geological Survey of England; and Mr. ROECHLING, C.E., of Leicester.

THE island of Cos, or Stanco, is one of many in the Ægean Sea. It is the nearest to Budrun, or Halicarnassus. It suggests the range of efforts by German archæologists when we find that this remote island has been made the scene of their operations. But as it is referred to in the catalogue of ships in the "Iliad" it evidently must have been occupied by Greeks prior to the time of HOMER. There was a Temple of Æsculapius, so probably the original inhabitants were Doric emigrants, who allowed themselves to be governed by an aristocracy. Moreover, importance is attached to the island from the circumstance that it was at one time in the possession of the Knights of the Order of St. John, who from the beginning of the fourteenth until the sixteenth century were masters of the island of Rhodes, about sixty miles distant. The explorations have been conducted by Dr. HERZOG, of Tübingen, who is accompanied by Herr HECHT, an architect. The remains of a temple were unearthed, as well as the four strongholds of the Order, viz. Narangia, Pilli, Antimachia and Kephalos. The later works are not only less ruinous than many examples of Christian structures, but in the walls stones have been found evidently derived from more ancient buildings. In consequence of the interest of the explorations some of the German representatives of the Order of St. John have subscribed towards the expenses.

GEORGE ELIOT, when describing GOETHE'S house at Weimar, said, "One of the most fitting tributes a nation can pay to its great dead is to make their habitation, like their works, a public possession." M. PAUL MEURICE was of this opinion when he acquired the house in the Place des Vosges, a part of which was occupied by VICTOR HUGO from 1832 to 1848. In that period he was the protagonist in the contest between romanticism and classicism. In HUGO'S time the Square was the Place Royale. In 1799 it received the title of Vosges as a compliment to the people of that department who quickly paid their imposts. At one period it was a fashionable district. RICHELIEU lived in one of the houses for a time; Madame DE SÉVIGNÉ was born there, and among the residents was that MARION DELORME who was made the heroine of one of HUGO'S dramas. There have been few changes in the exterior of the house since the poet lived there. The walls of the staircase now exhibit engravings, advertisements and other documents relating to him. The first floor is a gallery of illustrations, containing drawings, lithographs, engravings and pictures of subjects derived from HUGO'S numerous works. Many French artists have been proud to offer paintings especially executed for the purpose. There is also a collection of first editions of his books finely bound. It was the second floor VICTOR HUGO occupied, and there are placed his relics. He was a vigorous draughtsman, and a vast number of his sketches and designs have been brought together. He had the Mediæval love of painted and gilded woodwork. VICTOR HUGO died at his house in the Avenue d'Eylau, in the western suburb of Paris, but the whole of the furniture of the room in which he expired has been brought to

the Place des Vosges. There is much else that is interesting, for, in addition to the portraits and busts, there are various articles recalling his life. Neither in Stratford-on-Avon nor in Weimar are so many memorials of their great residents to be seen, while at Abbotsford there is little to suggest the influence of SCOTT. The Maison de Victor Hugo, which now has its special commission, can be considered as unique.

THE select committee of the House of Commons have declared the preamble proved of the "Post Office Sites Bill." The object of the Bill is to enable the Postmaster-General to acquire four sites, three in London and one in Bristol. The sites in London are, first, a site at Paddington for the extension of the post office in Francis Street, Paddington, and that site is being acquired under an arrangement with the Great Western Railway Company. They have land adjoining their station, and the Postmaster-General has certain land also already acquired by him; and an arrangement is being made with the company by which certain exchanges will be carried out, and by that means, and by the compulsory acquisition of some houses, the Postmaster-General will be enabled to enlarge his post office there. The next site which it is proposed to take is in Blackfriars, abutting on the river, a site in a street called Upper Ground Street, Blackfriars, and the object of taking that site is to enable the Postmaster-General to construct a generating station for electricity. The third site in London is one in Southwark, the object of which is to extend the South-Eastern District Office in the High Street, Borough. In addition to the sites which it is proposed to acquire by the Bill, it is also proposed to take power to build upon certain land in Buxton which the Postmaster-General has already acquired. The land has been bought, but it is subject to some conditions in conveyances from the Duke of DEVONSHIRE made about fifty years ago, which restrict the character of the buildings to be placed upon it. Those covenants are of a kind which it is extremely difficult to get rid of by any private arrangement, but at the same time they are entirely obsolete.

CATHEDRAL SERIES: EXETER.—THE CHOIR, LOOKING EAST.

NEW ROMAN CATHOLIC CHURCH, TONBRIDGE.

WINDOW, CA D'ORO PALACE, VENICE.

AMONG the private palaces of Venice not one has been more admired than the Ca d'Oro. It no longer presents the colouring and gilding from which its name originated. But it stands amidst Renaissance buildings of the Grand Canal as the survival of a period when Eastern luxury could be expressed by beautiful Gothic curves. Even in Mr. RUSKIN'S time it was subjected to restoration, on the heroic plan in which the first step, he said, is "to dash the old work to pieces; the second is usually to put up the cheapest and basest imitation which can escape detection, but in all cases, however careful and however laboured, an imitation still, a cold model of such parts as can be modelled, with conjectural supplements." On the other hand, THÉOPHILE GAUTIER asserted the old palace of the CONTARINI was restored with the most intelligent care. But we should remember the palace was then the property of Mdle. TAGLIONI, the *danseuse* who was admired by all *boulevardiers*, and, as GAUTIER remarked, the embroidered and laced appearance, which was in a style that was Greek, Gothic and barbaric, fantastic, light and aerial, seemed to be especially adapted for the nest of a sylph. According to him, Mdle. TAGLIONI in those days was filled with pity for the poor abandoned palaces of Venice, and she preserved several out of pure commiseration for their beauty and their desertion. But restoration under these circumstances could hardly fail to be whimsical. Our illustration is taken from a fine water-colour drawing by Mr. W. J. DAVIES, of Sidcup.

ST. MICHAEL'S COLLEGE, TENBURY.

By J. S. BUMPUS.

(Continued from last week.)

LEAVING the church for the present, we will make our way along the carriage drive to the principal entrance of the college, which is by means of a graceful Pointed doorway in the Warden's private house or "lodgings." Over this doorway is a small statue in a niche, representing the contest of St. Michael and the Dragon. This, in a vesica, serves as the college crest.

On entering, a corridor or glazed cloister faces us. It runs from one extremity of the college to the other—i.e. from east to west. The three windows, of four lights each, on the south side have plate-headed tracery and pillared mullions. Folding doors of oak on the south side of this corridor give access to the library, the schoolroom and the hall. A range of cupboards, along the blank wall beyond the hall, afford accommodation for the caps, gowns and surplices of the boys. Cassocks have never been worn at St. Michael's. On the north side, immediately on entering, is a Pointed doorway opening into the warden's lodgings, and, further on, a similar door admits to a picturesque wooden cloister connecting the college with the church. Here may be noted the beautifully-kept turf of the quadrangle. At the extremity of the corridor, on its north side, are the apartments of the matron. Close by, a spiral staircase of stone, constructed in a projecting western turret, and adequately lighted by small windows, conducts us to another corridor similar in length to that below, and hung with portraits and engravings. On the south side of this corridor are the spacious rooms allotted to the organist, and on the north those of the head-master, with a classroom adjoining. The last-named jut out into the quadrangle. At the north-east end of this corridor is a door of communication with the bedrooms of the Warden's lodgings. Still another staircase in the aforementioned turret leads to a large and well-ventilated dormitory, lighted at the east by a rose and at the end by a large Pointed window of four lights, from which an extensive

view over the surrounding country may be obtained. This dormitory has accommodation for thirty-six boys. Each has a separate cubicle screened off by curtains and divided by high wooden partitions. Sleeping accommodation for visitors is afforded in what is known as the "chapel dormitory," which, under a separate gabled roof, constitutes the floor above the head-master's rooms and classroom.

Descending into the upper corridor, we find, on its south side, a door opening into the "minstrels' gallery" at the eastern end of the hall, from whence a broad flight of stone steps leads to the ground floor.

The hall is a finely proportioned room, lighted on its south side and at its western end by Early Decorated windows of two lights each, with quatrefoil heads, the effect of which would be improved by the introduction of a little heraldic glass. The walls are panelled with oak to the height of the window sills, and above the dais (on which stands the high table and a carved chair of black oak for the exclusive use of the warden, who prefaces and concludes each meal by a Latin grace) the panels are emblazoned with the arms of various head-masters and Fellows of the college. On the north is a capacious stone chimney-piece, and facing it, on the south, an unconventional wooden buttery-hatch. Down the centre runs the boys' table. The flooring is composed of Minton's tiles. Several interesting portraits adorn the walls. That of the founder will, naturally, first attract attention. It is a full-length one, and represents Sir Frederick Ouseley at the age of thirty-one in his robes of Mus.D., as the newly-appointed Professor of Music in the University of Oxford. It was presented by the Warden (Dr. Sewell) and the Fellows of Radley early in 1857, the artist being Mr. W. Florio Hutchinson, once a pupil of Fuseli, and drawing-master at Radley College. In the background may be discerned several surpliced choristers. Three other portraits are of considerable rarity, viz. those of Dr. Henry Aldrich (Dean of Christ Church, Oxford—theologian, musician, architect and logician, died 1710); Dr. John Blow (organist of Westminster Abbey and organist and composer to the Chapel Royal, died 1708); and Dr. Philip Hayes (Professor of Music

ST. MICHAEL'S COLLEGE, TENBURY. GENERAL VIEW FROM THE S.E.

in the University of Oxford, 1777 to 1797, facetiously called by reason of his enormous bulk "Fill Chaise"). A much later acquisition is a portrait of Dr. C. J. Corfe, Bishop in Corea, and an honorary Fellow of St. Michael's. Beneath the hall are spacious kitchens and domestic offices, approached internally by a stone staircase at the western end of the corridor.

The Warden's lodgings comprise, on the ground floor, a study (in which is deposited the magnificent musical library collected by Sir Frederick Ouseley), a dining-room and a drawing-room. Above are three bedrooms. The square-headed, mullioned windows of all these apartments face the college garden. In the dining-room is a painting of Sir Frederick Ouseley as a child of seven or eight years old, represented as playing on the pianoforte. The artist's name has never been discovered, but the picture is a charming one.

The library, forming the south-east portion of the college buildings, is a large and lofty room, and worthy to rank beside many of those in the Universities of Oxford and Cambridge. The books were collected by Sir Frederick Ouseley and his father, Sir Gore Ouseley (the distinguished Persian diplomatist and scholar), between them. To enumerate its treasures would take up too much space. Its great features are French and Oriental books, the latter bearing mostly on the literature of Persia. Here we find Gould's rare and magnificent ornithological monographs; Dugdale's "Monasticon," with plates by Hollar and Coney; many county histories of great rarity and value; Turner's "Liber Studiorum," and a large collection of theological treatises and divinity. More recently, the "Encyclopædia Britannica" and the colossal "Dictionary of National Biography"—gifts of the present Warden, the Rev. John Hampton—have been added. The roof of the library is of oak, panelled, and the room is lighted on the east by a large flat-headed window of four lights, and on the south by three pointed ones of two lights each. Morning prayers for the school and household are here said daily at eight o'clock.

The church may next be visited. The style is Early Middle Pointed—one much employed by its architect. The building is cruciform, with lean-to aisles to nave and choir, both of which have clerestories. One of its most striking features is its height, being 69 feet from the ground to the ridge-crest. Its breadth is proportionate; its length scarcely so, being only 122 feet. As the church is both parochial and collegiate, it might be questioned whether the term "choir" or "chancel" were more appropriate. But, architecturally, the eastern limb is a choir, being of the same height as the nave. Another well-remembered feature is the graceful polygonal apse, somewhat Teutonic in *motif*.

The author (Mr. T. Francis Bumpus) of "Stained Glass in England since the Gothic Revival" truly observes in his able and interesting treatise (originally contributed to this Journal) that the church of St. Michael "exhibits sufficient departures both in plan and detail from home traditions to raise it far above the commonplace, while it shows none of that extravagance and bizarrerie which too often resulted from attempted originality." "This is noticeable," he continues, "in the artistically-planned and nobly-proportioned masses of steep roofs which meet at the crux without a central tower, in the roses which light the transepts, in the employment of the hexagonal apse, and in the tracery of its windows, where the presence of a large trefoil, impaled, so to speak, upon the central mullion, is rather reminiscent of German work. Indeed, the thorny character of this tracery, not only here, but in other of Mr. Woodyer's churches, may have been inspired by such refined examples of Middle Pointed traceries as occur in the choir aisles of the Liebfrau Kirche at Coblenz, though it must be admitted that on the whole the churches of this architect exhibit great freedom and independence of thought, and early fourteenth-century Gothic, without ever becoming vitiated, has ever retained in his hands as great a freshness, vigour and originality as that of his master, Mr. Butterfield, besides possessing an individuality which it is difficult to mistake."

From the wooden cloister, mentioned in an earlier part of this account, a large vestry in the south-east angle communicates with the nave by a narrow covered lean-to passage outside the south transept. At the west end of the north aisle there is a deep porch, with square-headed windows of four lights, filled with painted-glass by Lavers & Barraud. The

west front is a truly fine and dignified composition. A large window of six trefoil lights in two groups, with traceried circlets, surmounts a pointed doorway, on either side of which is blind arcading—a feature repeated with excellent effect below the rose window of each transept. All three gables are pierced with two narrow lights, and in the western ones are two bells of great sonority. Internally, with the exception of the aisles, porch and vestry, the church is groined with wood for acoustic reasons. The eastern limb contains one bay westward of the apse, with a segmental arch on either side opening into the choir aisles, the dripstones terminating in angelic figures. The north choir aisle is principally used by the communicants at the early celebrations. At the distribution of the Elements here the manipule is used, a tradition handed down from the early days of St. Paul's, Knightsbridge, and St. Barnabas, Pimlico. In the south choir aisle is kept the large library of MS. and printed music used in the daily services. The fenestration of the choir clerestory comprises two windows on each side of two lights apiece. Throughout the church, with the exception of the roses in the transepts and six in the clerestory of the nave, the windows are filled with stained glass. The greater part of the glass in the choir is coeval with the consecration of the church. Finely proportioned arches on columns, with richly foliated capitals, open into the transepts. There is no choir arch, but the line of demarcation westward of the crux is well accentuated.

The east window, in Hardman's best style, represents our Blessed Lord in Majesty. At His feet is St. Michael, with the usual symbols in allusion to the dedication. This window was the gift of the Hon. Miss Georgina Rushout, in many ways a munificent benefactress to the church and college. The nave windows are later insertions, several being memorials to departed members of the college. Three in the north aisle were erected to the memory of Sir Frederick Ouseley by former pupils. The glass in the north aisle is superior to that in the south, both as regards design and colouring, but it cannot be said that any of it can be placed on a par with that in the choir.

The tracery of the great west window was given by the Rev. Sir W. H. Cope, Bart.* The glass by Hardman, which fills it, is truly superb. Rich ruby tints predominate, and, seen under the influence of the westerling sun, this window is a thing to be remembered. It was inserted in 1857 from subscriptions collected by the Rev. John Miller, vicar of Bockleton, a mile or so from St. Michael's. John Miller, a man of great ability, had been Bampton lecturer at Oxford in 1817 and the life-long friend of John Keble, both at the University and in after years.

The altar, well raised, and vested in the colours of the ecclesiastical seasons, according to the Roman sequence,† is placed in the chord of the apse. The mensa is of oak, and there is a reredos of the same material surmounted with a canopy and adorned with polychrome. The projecting wooden columns and pinnacles at the sides are meaningless. One cannot help feeling that the sanctuary desiderates warmth and colour, at least as regards its lower part. This might be remedied by the suspension, from brass rods, of rich needlework in the form of wings. The pinnacles on either side of the reredos, with their connected traceried work in the form of flying buttresses, are by no means happy. The wings would conceal these, and thus remedy a defect in an otherwise exceedingly beautiful and original design.

Above the canopy of the reredos is a tall and slender metal cross, terminating in white flowers. The super-altar supports

* The Rev. Sir W. H. Cope was librarian and one of the minor canons of Westminster from 1842 to 1853. Somewhat late in life he succeeded a distant kinsman in the baronetcy and in the possession of Bramshill, Hants, one of the most interesting houses in England, standing in a park of unequalled beauty. This inheritance made Sir William Cope Charles Kingsley's squire, and a warm friendship sprang up between the two ardent, high-minded and rather unconventional clergymen. Sir W. H. Cope preached Kingsley's funeral sermon at Eversley in 1875. He was a capable musician, and edited some valuable collections of old English anthems. He published many literary works, and an edition of Sir Anthony Cope's "Meditations on Twenty Select Psalms." He died at Lennox Tower, Southsea, January 7, 1892, aged eighty.

† Adopted by the early Tractarians long before the rites and colours of the Church of Sarum had begun to be studied.

a cross and the two *cæca lumina* as prescribed in all cathedrals and collegiate chapels. Flowers are added at festal seasons. On the north side of the sanctuary are a table of prothesis and a chair of richly carved oak, for the use of the bishop of the diocese as visitor of the college—the gift of the Hon. Miss G. Rushout.

On the south are sedilia, surmounted by a pedimental canopy, sumptuously carved in stone. The apse has a pavement of minute tesserae disposed in geometrical figures. The roof of the choir is slightly polychromed, but in the apse more elaborately, with the symbols of the Trinity and the Evangelists. An iron grille of good design separates the choir from its aisles. The stalls, placed in the crossing of the transepts, as at Chichester, Winchester, Gloucester and Tewkesbury, are of oak and perforated. There are no canopies. The stalls are in two divisions, with rather lofty finials; they are not returned, but have subsellæ and open desks of iron in front for the boys. An iron screen carried up perfectly square, with folding gates, without a cross, but surmounted by seven candlesticks, separates the choir from the nave. It is coloured ultramarine, relieved by gold.

(To be continued.)

THE ROMAN FORUM.

DURING the last few weeks, says the correspondent of the *Morning Post*, great progress has been made by the Director of the Roman Forum, Commendatore Boni, in this immeasurable field for exploration. Considerable light has been thrown on the subterranean galleries connected with the games held in the time of Cæsar in the Forum. It is now clear that there were twelve elevators, each of which was worked by four men ensconced in chambers adjoining the apertures, also twelve in number, through which the elevators were hoisted into the open Forum above. Signor Boni is confident that there was some means of communicating with all the twelve chambers simultaneously from the room in which the director of the games sat. There was probably some kind of a speaking tube or simple telephone, by the use of which at a given signal the twelve elevators could be made suddenly and simultaneously to rise from the bowels of the earth to the open Forum, and to deposit there the parties of gladiators ready for the fray. Signor Boni has had made a model of one of these elevators, instructive traces of which are still embedded in the galleries underground. Nine of the elevators have still to be freed from equestrian statues which were set up above them at a later period, and this task must of necessity take some time. The foundations of these statues are in themselves so far interesting that they afford additional proof, if such were needed, of the callous manner in which any sort of material, whether valuable statue or portion of the Lapis Niger or some other remnant of interesting history, was utilised in later Mediæval times as substructure.

Signor Boni has also just discovered the complete square basement of the Janus Medius, which used to serve as the meeting-place for the old Roman bankers. It occupies precisely the spot assigned to it by the ancient writers, near the Arch of Janus in front of the Tabernæ Argentariæ. This, too, has been greatly spoilt by the work of the builders of the Middle Ages, who sank wells and built latrine about it. In one of the wells have been found quantities of remains of animals, such as sheep's jaws and goats' horns, and also fragments of pottery. In the middle of the road flanking the Basilica Julia he has also discovered ritual graves rectangular in shape, with a length of 4 and a breadth of 2 Roman feet, and divided by a space of not more than 10 Roman feet. In them he found a quantity of vases in the shape of chalices. He believes them to be augurial graves used for expiatory libations after contamination with human blood.

While exploring under the substructure of the Heroon of Romulus he came on a nearly complete prison composed of narrow passages leading to diminutive vaulted cells with tessellated pavement, and having a very strong sub-pavement of large heavy flags of travertine to render the escape of prisoners impossible. As a further precaution perimetral walls of blocks of tuff lined with bricks were built outside. At the foot of the Palatine Hill, behind the Sacrum of Juturna and the Temple of Castor and Pollux, Signor Boni has discovered the remains of an old Imperial palace, consisting of a building with a large hall adorned all round with niches, and with a vestibule, transformed at a later date into a Christian sepulchre, used as late as the eighth century. The walls and columns are ornamented with frescoes finished in the eighth century, and covered with Greek inscriptions. In the central portion of the building is to be seen a painted representation

of Pope Paul I., who was Pontifex during the ten years succeeding 737.

In the neighbourhood there are visible traces of four different layers of plaster, each decorated with paintings. On the top of one layer of plaster, which has a red surface, is another portraying a representation of the Madonna and Child, similar to those seen in the mosaics of the time of Theodoric. This painting covers in its turn another layer which shows traces of two angels painted in the sixth century. Above these, and painted during the middle of the eighth century, is a stratum of plaster showing figures of saints with nimbus in yellow and ascetic-looking faces. On the right is a series of paintings showing the figure of Pope Zacharias, the Crucifixion of Christ, and the figure of Theodotus, uncle of Pope Paul the First, who is represented as offering a model of the church, while in the Latin text adjoining he proclaims himself to be the "assisting advocate of Santa Maria Antica." This was the name of the Christian church which existed until the ninth century within the walls of the Imperial palace. Sixteen centuries, says Signor Boni, separate the tombs of the church of Santa Maria Antica from the Sepulchrum of the pre-Romulean Septimontium, which is now being rapidly explored.

Since I last wrote on the subject of these prehistoric tombs several new graves have been found by Signor Boni. One of them was being removed during my interview with Signor Boni, and it contained a very interesting black jar, which was tenderly placed on the table in the little museum. It was encrusted with damp earth, and has yet to be cleaned and put together. Another contained a skeleton, the head of which had been distorted by the subsidence of some blocks of tuff, with which the grave had been lined. In the grave of another skeleton, that of a child, several toys were found, and in another a lovely fibula of transparent amber hollowed out underneath in order to allow of the light entering more easily for the sake of still greater transparency.

LEITH WORKHOUSE COMPETITION.

IN recent years, says a correspondent of the *Scotsman*, the architects of Edinburgh and elsewhere have had reason to complain of the treatment they sometimes receive when their services are required in connection with the erection of public buildings. The most recent example of the kind of grievance under which their profession suffers is furnished by the Leith Parish Council, who are at present preparing for the erection of a new poorhouse at Seafield. Prompted by the Local Government Board, who have repeatedly pressed the subject upon their attention, the Council have discussed the question for several years. After considerable opposition on the part of a section of the members, the Council adopted a site at Seafield. The objection urged against this site was that it could not properly accommodate a building of the character required. It was at first proposed, without further preliminaries, to ask a Leith architect to prepare a design for the new building, but in the interests of the ratepayers this proposal was rejected by a majority of the Council in favour of the more reasonable method of open competition. The conditions of the competition were regarded by architects as distinctly vague, and they were the subject of discussion by the Edinburgh Architectural Association. The Association wrote to the Parish Council suggesting certain amendments in the conditions, but the Council would have none of them. In regard to the cost of the proposed buildings, the conditions were particularly ambiguous, the only guide being contained in the following sentence at the end of one of the clauses:—"The matter of cost will form an important element in deciding the merits of the plans." Recognising, however, that something more was required, the Council or their advisers prefaced the conditions with a special note in the following terms:—"It must be understood that the following notes are general and do not describe all the requirements, but that the plans must provide for a poorhouse, well finished and complete in every respect, planned on the latest and most approved principles, and equipped with all the latest sanitary and other appliances for the efficient working thereof." There are two types of poorhouses in vogue—the corridor system and the pavilion system. The corridor design, represented by Craiglockhart and Craighleith poorhouses, is now regarded as old-fashioned and defective in the matter of ventilation and administration. So fully have these defects been recognised that where new poorhouses have recently been erected, the pavilion system has been adopted. The Edinburgh Royal Infirmary and the new fever hospital are examples of the pavilion system, which, although more expensive, has special advantages in the way of ventilation and sanitation. In view of the fact that the Leith Parish Council asked for a poorhouse "planned on the latest and most approved principles," the majority of the eight architects who sent in plans adopted the pavilion system, although the site

was so awkwardly shaped as to call for some ingenuity in the planning of the buildings. In due course the plans were sent in, and the Parish Council appointed Mr. Sandilands, a Glasgow architect and an expert in poor-house construction, to advise the Council in the selection of the best design. Mr. Reid, a well-known surveyor in Edinburgh, was appointed by the Council to advise them in regard to cost. As a result of Mr. Sandilands's consideration of the plans, four sets were set apart from the others, and to the two best of them he awarded the first and second premiums. The authors of these premiated designs were both members of Edinburgh firms. When Mr. Sandilands's report was placed before the Council, certain of the members demanded that a report should also be obtained on the four designs which the assessor had apparently not considered worthy of separate report. When the matter was discussed a few days ago at the Parish Council, a majority decided in favour of the corridor system of plan, and after a vote between plan No. 2 and plan No. 6, the latter was adopted. In the course of the discussion it emerged that the names of the authors of the plans had improperly become known to at least some of the members, and in that way the impartiality of the Council's judgment was impaired. No. 6 plan is by Mr. J. M. Johnston, a Leith architect, whose work was placed seventh on Mr. Sandilands's list of the order of merit. According to this plan, the cost of the new building is stated to be about 60,000*l.* if in stone, or 46,000*l.* if in brick, but the official measurer retained by the Parish Council to advise them, estimates the cost at 72,381*l.* for a stone building and 70,984*l.* for brick. As against these figures, the assessor estimated that the first premiated design could be carried out for something like 80,000*l.* if the cubic space per inmate were reduced to the minimum requirement of the Local Government Board. Those who have knowledge of such matters hold that it will be absolutely impossible to carry out No. 6 plan for the sum estimated. The matter is of wider importance than the claims of competing architects. There is danger that the ratepayers may be misled as to the expenditure involved, and that, as in the case of Bangour, the real facts may not emerge until it is too late. An unfortunate element in the present case is the apparent determination of a majority of the Council to give the work to a local man, irrespective of the report of the expert engaged to advise the Council. The architectural profession consider themselves badly treated in connection with these open competitions. They do not profess it to be a grievance that an expert should set aside their plans in favour of others, but they do regard it as unfair that when they have secured the award of the assessor their plans should be discarded without good reason. In such a case, the 100*l.* premium is very inadequate compensation for what, in the case of the Leith poorhouse design, involves something like six months' hard work. It is expected that Edinburgh will shortly have control of a very important competition—that for the design of the Usher Hall—and on the part of the architectural profession the hope is being expressed that not only in connection with that design but in connection with similar work elsewhere, the position of successful architects will be honourably regarded.

EXCAVATIONS AT ABYDOS.

IN a letter to the *Times* Professor Flinders Petrie writes:—The continuation of the work of the Egypt Exploration Fund at Abydos this year has given a wider view of the early civilisation, of which the general lines had been fixed by the previous work on the royal tombs and the town. The clearance of the old temple site over several acres has brought to light in a depth of about 20 feet no less than ten successive temples, ranging in age from about 5000 to 500 B.C. For the first time we can see on one spot the changes from age to age through the whole of Egyptian history. To separate these buildings was an affair of anatomy rather than spadework; the walls of mud brick were so commingled with the soil that incessant section-cutting with a sharp knife was the only way to discriminate the brickwork. Often only a single course of bricks or a thin bed of foundation sand was all that told of the great buildings which had existed here for centuries. Over 5,000 measurements were taken for the plans and levels. The main result as regards the religion is that Osiris was not the original god of Abydos; the jackal god, Upuaut, and then the god of the West, Khentamenti, were honoured here down to the twelfth dynasty. The most striking change is seen about the fourth dynasty, when the temple was abolished, and only a great hearth of burnt offering is found, full of votive clay substitutes for sacrifices. This exactly agrees with the account of Herodotus that Cheops had closed the temples and forbidden sacrifices. This materialising of history is made the more real by finding an ivory statuette of Cheops of the finest work, which shows for the first time the face and character of the great builder and organiser who made Egyptian government and civilisation what it was for thousands of years after. This carving is now in the Cairo Museum.

The discoveries of the civilisation of the first dynasty, the beginning of the kingdom, expand what we already had from my work in the royal tombs. Of Menes, the founder, we have part of a large globular vase of green glaze with his name inlaid in purple; thus polychrome glazing is taken back thousands of years before it was previously known to exist. The free use of great tiles of glaze for wall coverings shows how usual the art was then. In the highest art of delicate ivory carving there are several pieces of this age; especially the figure of an aged king, for its subtlety and character, stands in the first rank of such work, comparable to the finest carvings of Greece or Italy. We must now reckon the earliest monarchy as the equal of any later age in such technical and fine art.

Pottery of forms and material quite unknown in Egypt also belongs to this remote age; and it proves to be identical with that in Crete of the late Neolithic age. This fresh connection illustrates the trade and the chronology of that period. A head of a camel modelled in pottery takes back its relation to Egypt some 4,000 years; hitherto no trace of it had appeared before Greek times. An ivory carving of a bear extends also the fauna of early Egypt.

The great fort long known as the Shunet ez Zebib is now connected with the remains of another fort which was discovered between that and the Coptic Deir, which is in a third fort. These buildings prove now to have been the fortified residences of the kings of the second dynasty, whose sealings we have found in the dwelling-rooms.

Of a later age may be noted some large decrees of the fifth and sixth dynasties, the oldest example of iron yet known, which is of the sixth dynasty, and in the eighteenth dynasty a great memorial tablet of the grandmother of that line, and the remains of a cliff temple of the type of Deir el Bahri. These are but the salient points of a winter's work of much historical interest. The collection will be exhibited as usual at University College, Gower Street, from July 1 to 25.

Unhappily, the growing lawlessness of Egypt, which Lord Cromer noticed in each of his recent reports, has affected our work, and "a large number of offences, not very serious in themselves, but which cumulatively become serious, have been committed, and but too often have been committed with impunity." (Report, 1902, p. 40.) A statue was stolen from my house; and though the footprint of the thief exactly agreed with the very peculiar foot of one of the men who were notoriously accused in the village, and all the links were named by witnesses, yet no conviction could be obtained; 35*l.* are said to have changed hands as bribes over this. Next, my workmen from Quft were subject to a general conspired assault in the market, and each robbed of his money at once. But no redress whatever could be obtained. The police officer added to the injury by taking away one man who had been beaten to see the doctor, who did nothing but detain him till he paid 10*s.* bribe to be let go. Last year the relations of a man who died of fever were mulcted of 6*l.* by another doctor; and, on my complaining, the official inquiry resulted in giving an account which was absurdly false, to my personal knowledge.

It is impossible that the present machinery can work to elicit the truth. Witnesses are examined by petty officers, who dictate the final statement of evidence at their own will; and the witnesses are summoned through their sheikh, who is the first man to be "squared" by the offenders, and "who, they think, will assuredly sooner or later endeavour to wreak his vengeance on them." (Report, p. 36.) Such a system—dating long before the British occupation—is the most perfect for facilitating bribery and the suppression of truth. This is not the place to discuss the remedies. Happily Lord Cromer considers that "the points which most require attention are the police, the Department of Justice and sanitation." I do not touch on more personal threats to our party and being fired at, as I only wish here to refer to the failure of justice. But matters have gone so far that we must look for safety to our own resources rather than to the law, which has in each case proved to us useless.

GLASS AND MOSAIC.*

WHY or when a glass manufactory was founded in "Alsatia" I am unable to say definitely. The proximity of the river and the depreciated value of the property, owing to an evil reputation, may have been inducements to the original founder. The works must have been in existence before the end of the seventeenth century, for an advertisement of the wares produced appeared in the *Tatler* in 1710, and the manufactory must have been in a tolerably advanced condition to warrant an advertisement in such an important periodical. The advertisement ran as follows:—

"At the Flint Glass-House in White Fryars near the

* A paper read on the occasion of the visit of the members of the Society of Arts to the Whitefriars Glass Works, by Mr. Harry Powell.

Temple, are made and sold by Wholesale and Retail, all sorts of Decanters, Drinking Glasses, Crewitts, &c., or Glasses made to any pattern of the best Flint, as also all sorts of common Drinking-Glasses and other Things made in ordinary Flint Glass, at reasonable Rates."

It is about the direct lineal descendants of these "decanthers and crewitts" that I am about to speak.

All table-glass, worthy of the name, is blown glass. Every vase, wine-glass or decanter has commenced its career as a white hot, solid mass of viscous material coiled round the end of a long iron blowing-tube. A well regulated puff of breath through the tube creates a bubble, and the bubble is the embryonic stage of all table-glass.

The form of the bubble can be readily modified. Glass so long as it is hot is almost infinitely ductile, and even after it has been partly chilled its ductility can be restored by reheating. If the bubble, while still attached to the blowing-iron, is held downwards it lengthens out into an ellipse; if the blowing-iron is held vertically with the bubble uppermost the bubble compresses itself into the form of a "scone," and if the "scone" is pierced in its centre, and the blowing-iron is trundled like the handle of a mop the "scone" unfolds itself into a flattened disc. By these simple movements (which are in constant use in the glass factory) the form of the bubble is modified without the use of tools. With the aid of a primitive-looking tool, closely resembling an exaggerated pair of sugar tongs, and of a stool or chair, with two parallel projecting arms, between which the workman sits, and on which he rests and rolls the iron rod to which the glass is attached, every imaginable modification of a spherical form can be developed.

At the present time, owing to a demand for excessive regularity and excessive lightness and thinness, very many of the simple forms of table-glass are blown in moulds. This process of moulding requires comparatively little skill, and the valuable training which the fashioning of simple forms with the tool affords is being lost. If the fashion and demand for so-called "aerial" glass is long continued the skilled craft of glass-blowing will disappear.

The English glass-blower, however clever he may be with his fingers, has no talent for design. He is painfully realistic, and if asked to produce a vase, without a pattern to guide him, will make an accurate model of a man's tall hat, a pair of bellows or some other everyday piece of furniture, but will fail to create anything combining originality with beauty of outline. What technical education will do for the English glass-blower in the distant future remains to be proved.

The limitations of design are very strait. When what appears to be a fresh form or combination has been evolved, the discovery is generally made that the same has been done, and done better, ages before. Even when a satisfactory design has been produced the designer may meet with unexpected difficulties owing to the wealth of possibilities of failure belonging to the craft. The would-be designer must closely and constantly watch the phases of form through which vessels pass whilst being fashioned, and must note any outline that appears to be beautiful or novel. The most successful designs have been based on such study combined with the study of the productions of early Venetian, Dutch and German master-craftsmen.

In recent years Mr. T. G. Jackson, R.A., was one of the first to realise that a wine-glass may be something more than a bowl upon a stick, and that a graceful outline is not incompatible with utility.

About 1875 the late William Morris made several designs for table-glass, possessing, as all his work possesses, interest, beauty and originality.

Mr. Albert Hartshorne has written and illustrated a voluminous work on the evolution of drinking-glasses. The chief variation is shown to have occurred in the leg, and the variation may obviously be almost unlimited. Legs may in section be solid or hollow, cylindrical or oval, square or oblong. They may be twisted; they may be, as it were, turned, with hollows, curves and projections; they may be in one piece or in many pieces, and they may be ornamented with seals, frills, or "pinchings." Even the inside of an apparently solid leg may be decorated with plaited threads of coloured enamel, or with spiral air bubbles. These corkscrew lines of silvery air have a very simple origin. The leg is made from a small lump of viscous glass. Into this lump as many pin-pricks are made as spirals are required. The lump is then pulled out into a leg and twisted at the same time. As the leg stretches and twists, the pin-pricks stretch and twist and display themselves as spiral coils of air.

There is not the same scope for variation in the forms of decanters and jugs as there is in the form of drinking-glasses and vases. The handles of jugs may be distinctly decorative, but are always treacherous. With the view of obviating the necessity for handles, decanters have been made with flat or dented sides so as to afford a secure grip for the fingers, but public taste has demanded that even these shapes should have handles affixed.

The display of niceties of form depends in no small degree on the chemical nature of the glass employed. For this purpose the soda-lime glass, which is used in Venice, and the use of which has recently been introduced in England, although it is seldom absolutely white, and often streaky and bubbly, is better adapted than the obtrusively brilliant potash-lead glass from which English table-ware is commonly made.

The mention of the chemical nature of glass naturally introduces the subject of colour. Some thirty years ago the colours available and used for English table-glass were ruby, canary yellow, emerald green, dark peacock green, light peacock-blue, dark purple-blue and a dark purple.

About 1870 the "Jackson" table-glass was made in a light dull green glass, similar to that used in stained glass as "white," containing a wealth of bubbles and interesting irregularities. Owing to these so-called defects the glass only appealed to a very select circle. The dull green, commonly known as "pale green," was followed successively by amber, white opal, blue opal, straw opal, sea-green, horn colour and various pale tints of soda-lime glass, ranging from yellow to blue. Experiments have also been tried with a violet coloured glass, a violet opal, a transparent black, and with glasses shading from red to blue, red to amber and blue to green. Touches of colour have been added to vessels in course of manufacture by means of seals or tears of molten glass, applied like sealing-wax, or by causing vessels to wrap themselves round with threads or coils of coloured glass. By the application of a pointed iron hook, whilst the vessel and thread are still ductile, the parallel coils can be distorted into bends, loops or zigzags.

The surface of vessels may be rendered lustrous by rolling the hot glass on metallic leaf, or iridescent by the deposition of metallic tin, or by the corrosion caused by the chemical action of acid fumes. Gilding and enamel decoration are applied to vessels when cold, and fixed by heat.

Cutting and engraving are produced by pressing the surface of vessels against the edge of wheels revolving on horizontal spindles. "Cutting" wheels range from 18 inches to 3 inches in diameter, and are made of iron for grinding, stone for smoothing and wood for polishing. "Engraving" wheels are small, ranging from 1 inch to $\frac{1}{4}$ inch, and are made of copper.

It is the fashion to run down cutting as a form of decoration, a fashion which is partly due to a somewhat ill-advised pronouncement of Professor Ruskin. In appendix 12 of the second volume of "Stones of Venice," he says with regard to glass, "Durability and transparency being the two peculiar characters of glass, all work in glass is bad which does not with a loud voice proclaim one or other of these great qualities, and consequently all cut glass is barbarous."

In making this statement Professor Ruskin evidently forgot that the power of reflecting and refracting light is also a peculiar and important character of glass. It is true that the process of cutting was carried to an extreme pitch of vulgarity in the middle of the last century, but there are many specimens of English and Irish cut glass of the eighteenth century of great refinement and beauty.

The true use of engraving is to add interest to vessels by means of coats-of-arms, monograms, inscriptions and graceful outlines. The improper, but too common, use of engraving is to hide defective material.

In the Paris Exhibition of 1900 surface decoration was the prominent feature of all the exhibits of table-glass. The carved or "cameo" glass, introduced by Thomas Webb, of Stourbridge, in 1878, had been copied with varying success by glass-makers of all nations. Frequently the surface had been dulled by acid, so as to produce what is called a "satin" finish. M. Emile Gallé and Daum Frères, of Nancy, exhibited specimens of this form of decoration possessing considerable beauty. The so-called Favrite glass of Messrs. Tiffany, of New York, owes its effect in great measure to surface colour and lustre. The vases of Karl Koepping, of Berlin, are exceedingly graceful and fragile, but appear to be creations of the lamp rather than of the furnace.

I have already referred to the impetus given to the manufacture of English decorative table-glass by William Morris and T. G. Jackson. I am unwilling to allow this opportunity to pass without mentioning two other benefactors of the craft of glass-working, although their influence has only affected table-glass indirectly. To the one, Charles Winston, is due what may justly be called the renaissance of English stained glass; to the other, Sir W. B. Richmond, is due the demonstration on a large scale that English mosaicwork is a practicable form of structural decoration.

Winston was born in 1814 and died in 1864; he was a busy barrister, but devoted all his spare time to archaeology, and especially to the study of stained glass of the twelfth, thirteenth, fourteenth and fifteenth centuries. In the pursuit of his hobby he examined nearly all the best examples of ancient stained glass in England, and made a large number of careful drawings from them. He satisfied himself (as stated in his memoirs published in 1865) that "the success of a glass painting depends as much on the quality of the material as on the skill

of the artist" What he did for stained glass can best be illustrated from his own letters. Writing to his friend, Mr. C. H. Wilson, he says:—"Ever since 1850 I have been amusing myself, at no small cost, in having analyses made of ancient glass. . . . I offered to Chance of Birmingham the analyses if he would attempt to work them out, but he refused. Ultimately Powell offered to take the matter up, and erected a furnace for the purpose. It is fortunate that he did offer, for without his aid there would have been no practical result, and had his place been further from the Temple I could not have attended to the experiments as much as I did. . . . I have had two windows done in the Temple Church (the round part) to commemorate our triumph. . . . The new material is as harmonious, brilliant and at the same time solid in appearance as the old glass. . . ." Again writing in July 1854, about a window in Lincoln Cathedral, he says, "I do not see the slightest difference between it (the new glass) and the old, except the dirt. The ruby is splendid."

The coloured glass made for mosaic windows was for long known as "Winston's" glass. It was the origin of the stained-glass branch of these works, and was a cause of contact with Burne-Jones, Morris, Ford Madox Brown, Poynter, Moody, J. Doyle, Albert Moore, Jackson, Wooldridge, Holiday and other artists.

A letter written by Winston in November, 1854, forms a link between his work and that of Sir W. B. Richmond. He writes:—"Dear Powell,—I have at last got some specimens of the glass mosaicwork from Sta Sophia at Constantinople, and from St. Paul's at Rome, which I have given to Mr. Clarke to analyse, and I doubt not you will soon be able to produce the same yourself." It was long before this prophecy was fulfilled. A period followed devoted to experiments in the manufacture of enamels and in technique. One relic of these experiments is an angel's head, executed in 1865. Subsequently panels of glass pictorial mosaic were erected at South Kensington Museum, and pavements of glass mosaic were put down at South Kensington, at the Society of Arts and in several churches.

In 1884 a large panel representing the central group of Raphael's "Disputa" was put up on the east wall of the morning chapel of St. Paul's Cathedral, and in 1887 Holman Hunt's picture of "Christ with the Doctors in the Temple" was translated into mosaic for the reredos of Clifton College Chapel. Both these works were executed in what is known as the "New Venetian" method, *i.e.* they were treated as panel pictures and worked in a workshop.

In 1891 Sir William Richmond, R.A., was commissioned to carry out the decoration of the choir of St. Paul's Cathedral in glass mosaic. A study of these mosaics (all of which, with the exception of two angels of the Passion at the extreme east of the choir, were executed *in situ*) will prove the superiority of Sir W. Richmond's method of working. St. Paul's affords ample scope for comparing the two methods (the "workshop" method and the *in situ* method), for not only, as has already been stated, are there examples of English glass mosaic worked in the Venetian method, but there are important examples of Venetian work in the pendentives of the dome and on the west wall of the morning chapel. If, however, further proof is needed of the superiority of the *in situ* to the "workshop" method, a comparison should be made between some of the unrestored mosaics in Ravenna, which were certainly worked *in situ*, with mosaics in Rome and Venice which have been "restored" by the Venetian method.

Sir William Richmond has proved that mosaic must be used as the coloured surface of a structure, and not as pictorial panels fixed to a structure. If this may be accepted as an axiom, the whole process of mosaic is enormously simplified. There is no need for minute shaping or fitting of the tesserae. Indeed, so great is the covering power of gold and coloured enamels that in some positions (according to the distance from the eye) the tesserae may be placed at from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch apart, and yet the whole surface is adequately coloured. There is no need of an extensive palette; every shade and tint can be produced by the contiguity of contrasted colours. By working *in situ* the ground itself, as well as every fragment and contrast of colour, can be given its full value. There is, moreover, no real difficulty in working *in situ* or of supervising the work.

It may be asked why, in a paper on "Table-Glass," I should have referred to the work of Winston and Sir W. Richmond. Their influence, however, on table-glass, though indirect, has been of considerable importance. It was the manufacture of Winston's glass that suggested the manufacture of vases and table-glass in soda-lime glass, and the preparation of the coloured golds and enamels for Sir W. Richmond's mosaics suggested the introduction of many of these colours and combinations of colours in the manufacture of table-glass. There is yet another reason for this apparent digression; stained-glass windows and mosaics, as well as opaque glass tiles and "opus sectile" thermometer tubes and pump-barrels, electric-light fittings and work in silver and in

iron are all descendants and developments from the "crewitts, decanthers" and other simple forms of table ware which were advertised in the *Tatler* in August 1710.

THE OLD CITY WALL, EDINBURGH.

A WAY down in the purlieus of the Pleasance, behind the old ramshackle buildings which had clustered round the city wall in the beginning of the eighteenth century, says a correspondent of the *Scotsman*, is a bit of the Flodden wall erected after the disastrous defeat of September 9, 1513. That lamentable encounter with the English caused the most intense excitement in Auld Reekie, and the nobility and legal luminaries who had their residences on the grassy slopes between the High Street and the Cowgate, and who were consequently outside the enclosing wall erected in 1460, were naturally clamorous to be protected in case the enemy should attack the city.

The 1460 wall of circumvallation descended eastwards from the castle, probably between the High Street and the Cowgate, until striking the line of St. Mary's Wynd it turned northwards at right angles to a junction with the Netherbow Port. The valley outside this wall embraced the sloping banks at the base of which lay the Cowgate, and was liberally sprinkled with goodly houses, the residences of the well-to-do. These were, of course, without any protection in the event of a siege, and immediately after Flodden it was decided to increase the area of enclosure.

The new wall extended southwards in continuation of the old one until it reached the Cowgate Port. This port is said to have been completed in 1516, and was at the east end of the Cowgate, and just at the head of the south back of Canon-gate and the foot of St. Mary's Wynd. The wall extended further south, up the sloping hill known as the Pleasance, until it reached the corner of Drummond Street. It then turned westwards, the point of junction being marked by a large circular bastion tower at the corner of the intersecting thoroughfares. The curtain wall between this tower and the Cowgate Port was about 350 feet long. This Flodden wall is said to have been built with incredible speed and of great strength. No doubt fear lent haste to their efforts. The idea of great strength at that time we find defined in the description of an addition made to the city wall in 1620, where it is stated that the wall was to be 5½ ells in height to the battlement (or about 17 feet 9 inches), while the parapet was to be 2 ells high (or about 6 feet 2 inches). This is taking the ell at 3 feet 1 inch. This would give a total height of about 23 feet 11 inches. From the ground to the battlement the wall was to be 5 feet in thickness, while the battlement was to be 2 feet. The parapet or battlement had embrasures to facilitate surveillance and for effective defence by the burghers of the city.

It was not probably until early in the eighteenth century, or 100 years after the Union of 1603, that buildings began to cluster outside this wall, so as to screen it from the public view, and to border the way leading down to the Cowgate Port. The strip of the curtain wall referred to was for a considerable length in existence until lately, and at a visit towards the latter end of 1901 it was measured, and found to correspond very closely with the dimensions above given. It was built on the escarpment or natural slope of the side of the hill, and was an ordinary rubble wall, such as was built in Mediæval times for the purpose of defence. It had a good stone face, and was hearted with rough blocks and lime mortar. Some portions were as hard as rock. Other portions which had not been properly protected from the water soaking down through the high soil behind had to some extent lost its tenacity, and was, through obvious neglect, in an inferior condition. The enormous weight of material in the portion taken down—about 300 tons—made it a ponderous mass, and such an interesting relic was well worthy of some attention for its preservation. Indeed, we surely owe a duty to posterity to deal reverently with old work of this description, and to exercise every care in our treatment of it.

The wall for a length of about 60 feet had, at the date of my visit, been condemned, and was in course of removal. This was very unfortunate, as another retaining wall built in the soil to the west of it, or judicious support by buttresses, or even holes formed into it and grouted up with concrete, might have preserved it for centuries to come. Many Mediæval structures in a much more dangerous condition have been preserved in this way. The wall where removed marked the boundary between the grounds of the City Fever Hospital and the low-lying land bordered by the old and new buildings fronting the Pleasance, and could only be examined by passing through the old buildings which covered this trapezium-shaped area of land.

The Ordnance Survey marks the spot as the site of the convent of St. Mary of Placentia, and in 1781 it is said that a statuette was found in the ruins of some old buildings there which were being removed. Of the history of this convent

nothing is known. It was supposed to have stood about 60 yards from the south-east angle of the city wall, near the foot of Drummond Street, and may have been in existence in the fifteenth century. Close by is also marked the site of the Blackfriars Monastery, A.D. 1230, and from the human remains found when the old city wall was being removed lately it would appear as if a portion of the ground had been set aside as a burial-place in connection with one or other of these Mediaeval institutions, or in connection with the dissecting theatre attached to the Chirurgeons' Hall.

Over the entrance door of one of the wings of the Fever Hospital buildings is the date 1697, and no doubt this was the old Chirurgeons' Hall. It is shown as a separate structure surrounded by gardens in Edgar's scale map of the city dated 1742, while at that date only three buildings existed to the east of the wall and on the west side of the Pleasance between Drummond Street and the Cowgate Port.

The parapet of the old city wall being of comparatively light masonry, and exposed to the weather on both sides, has long since disappeared, while part of the walls of the adjacent old dwelling-houses had been built on the lower portion of the wall and a new portion of wall and railing added at other parts. The lower part of the wall, however, was quite intact, and so corresponded in structural appearance and dimensions to what has been previously stated as to be of undoubted authenticity.

One cannot but regret the disappearance from time to time of here a bit and there a bit of what to the historical student is most interesting work, and I would plead for more care being taken to preserve wherever possible these links with the past. This portion which has been taken away and replaced by a new wall is about 60 feet in length and I venture to think could have been preserved without much difficulty. It was in such a position as not likely to have necessitated its removal for the development of the property on either side, as it formed a natural boundary between the high and the low ground, and was the march between the city grounds and adjoining properties of comparatively small value. These remnants of our historic past are now fast disappearing, and unless attention be called to the matter there appears to be no one in civic circles having any sentiment in the matter which would make them exercise ingenuity and skill for their preservation.

A very small bit of the old city wall now exists at this part, and one would hope that it will be better looked after than that adjoining, and not be sacrificed by the first one who chooses to dig away its natural support.

In Gordon of Rothiemay's map, dated 1647, the city wall is shown just behind the building representing the College of Chirurgeons, and although this map is a mere perspective sketch, inaccurate in many respects, it shows approximately the site of the wall at that time, bordering the Pleasance, or the "Suburbium de Plaisanc," as it is therein designated.

The ground to the west of this portion of the city wall was probably levelled up to the commencement of the battlement at the time of the erection of the wall to serve as ramparts; at least it would probably be so in parts, as such a practice was common on the interior of walls of defence. Where this was not done there were inclined access planes, or stairs, leading to elevated plateaus for the convenience of the defenders, as we see in Roman and Mediaeval examples.

What one would like to see is that the stability of these old walls, or other ancient structures of historic interest in our city, should be carefully looked after. No one would wish them "renewed" or "restored," but all would wish them judiciously preserved to lend interest to our ancient town, and so that we might be enabled to hand them on for the enjoyment of generations yet unborn.

VALUATION OF CHRIST'S HOSPITAL.

THE further hearing of the appeal of the council of almoners of Christ's Hospital, Horsham, against the assessment committee of the Horsham Union, in respect to two poor rates, one in regard to Horsham Rural and the other to Itchingfield, took place at the West Sussex Quarter Sessions at Horsham on Saturday last, before his Honour Judge Lumley Smith and several magistrates.

The first hearing took place on Thursday, June 25. It was then stated that a valuation of the schools was made by the overseers, and the gross rateable value was put at a little over 11,000*l.*, and the net rateable value at 8,817*l.* The council of almoners thought the sum excessive and objected, whereupon the assessment committee called in Mr. A. L. Ryde (Messrs. Ryde & Sons, Westminster), who raised the net rateable value from 8,817*l.* to 11,150*l.* The case for the appellants was closed at the first hearing, and Mr. Ryde, who was the first witness called by the respondents, was under cross-examination by Mr. Bray, K.C. This was now continued, says the *Sussex Daily News*, and had reference to detailed particulars as to how

witness arrived at his valuation. He did not consider there was any extravagant expenditure. His instructions were to make a moderate assessment, and this he did. There was no reason to put on an excessive figure.

Mr. Charles Frederick Jones, rating surveyor and valuer, who said he acted for over forty unions, including that of Horsham, and gave evidence at great length, was next called. His practice was, he said, not to rely solely upon the cost, and he had not done so in the present instance—in fact, he had reason in some cases to put it aside altogether. He always excluded anything of a monumental or ornamental nature. As to wasteful extravagance he saw nothing unnecessary or any over-ornamentation. The buildings were up to date with water, drainage and electric light. Externally they were very plain indeed. The art school was substantially built, with no undue embellishments. He did not consider the roof, which was 26 feet, unduly high. The science school, classrooms and school hall were not exceptionally large, and contained nothing elaborate or decorative. There was not too much air space in the dormitories. The infirmary and sanatorium were not of an ornamental character, and were not too large for the establishment. In regard to the dining-hall, had the architect adopted the suggestion of Mr. Hedley and had a lower roof, he would have damaged his reputation. In the dining-hall there would be from seven hundred to a thousand people, and it was absolutely necessary that a high sanitary state should be maintained at all times. To secure this there must be a proportionate height to the roof. The architect was to be highly commended upon the well-proportioned roof.

Mr. Boxall, K.C.: Do you think money has been injudiciously spent?—Witness replied that in his judgment all parties concerned merited high commendation for the utility of the buildings. There was no injudicious outlay. Whatever was ornamental he excluded. Regarding the suggestion that the walls of the roof were too thick, he did not believe they were, out of safety for the building.

At this juncture an argument ensued between the judge and counsel as to whether certain formalities were complied with in regard to the specified rate for Itchingfield parish, owing to the October rate being given instead of May, which latter was the rate objected to and appealed against. His Honour held that the Court could not hear the appeal, which, he said, would be dismissed. The rateable value in regard to Itchingfield, however, was stated by counsel to be exceedingly small compared with that in dispute for Horsham.

Mr. William Eve, a surveyor of forty years' standing, stated that he had valued many colleges and schools, including Oxford University. His assessment was made on the structural value, and, as at Oxford, he discarded all ornamental work. A contractor's basis was of no use as a guide.

Witness was cross-examined at some length upon the opinions which he gave in the Oxford case as to his method of valuing, and he still adhered to his views.

Mr. Boxall, for the respondents, pointed out that in a class of building like Christ's Hospital they could not fix a yearly rental such as in railway and gas companies by ascertaining the profits of the undertaking; therefore they must consider it from the view of what a hypothetical tenant would give. In the Oxford case they had to deal with buildings of remote antiquity, but in the present appeal there was no such difficulty, because they knew the structural cost, which was nearly equivalent to structural value. The almoners were trustees of immense sums of money, and they were bound to administer it for the benefit of their trusts, and built according to the provisions of their scheme, which was subject to the approval of the Charity Commissioners. This would explain that there was no waste of money. He asked the Court to give the respondents 4 per cent. on the utility value, submitting that this would be a reasonable valuation.

Mr. Bray, replying for the appellants, urged the Court to reject the contractor's basis, which was upon actual cost, and was utterly untrustworthy. They must base their rating on the commercial or market value, and exclude anything of an ornamental or monumental value. He denied that the Charity Commissioners had anything to do with the expenditure. The trustees had not the least claim upon the district, because they had bought the land and provided themselves with police, drainage, water-supply and electric light.

After the Justices had retired, his Honour said that the appeal against the rate made by Horsham Rural should be allowed, and that the figures should be reduced to gross 10,000*l.*, rateable value 7,500*l.*, and that the assessment committee should pay the costs of the appellants. The Itchingfield appeal would be dismissed owing to proper notice not being given, each party to pay their own costs. The costs will be taxed out of sessions.

The Court sat for nearly six hours.

The Brighton Town Council have resolved to organise an exhibition at the Aquarium during the autumn of Modern Architecture and Building Improvements.

TESSERÆ.

Giacomo Amiconi.

THIS Venetian painter of history came to England in 1729, when he was about forty years of age. He had studied under Bellucci in the Palatine Court, and had been some years in the Elector of Bavaria's service. His manner was a still fainter imitation of that nerveless master Sebastian Ricci, and as void of the glow of life as the Neapolitan Solimeni. Amiconi's women are mere chalk, as if he had only painted from the ladies who paint themselves. Nor was this his worse defect; his figures are so entirely without expression that his historical compositions seem to represent a set of actors in a tragedy, ranged in attitudes against the curtain draws up. His Mark Antonys are as free from passion as his Scipios. Yet novelty was propitious to Amiconi, and for a few years he had great business. He was employed to paint a staircase at Lord Tankerville's in St. James's Square, now destroyed. It represented stories of Achilles, Telemachus and Tiresias. When he was to be paid he produced bills of workmen for scaffolding, &c., amounting to 99%, and asked no more, content, he said, with the opportunity of showing what he could do. The peer gave him 200% more. Amiconi then was employed on the staircase at Powis House, in Great Ormond Street, which he decorated with the story of Holofernes, but with the additional fault of bestowing Roman dresses on the personages. His next work was a picture of Shakespeare and the Muses over the orchestra of the new theatre in Covent Garden. But as portraiture is the one thing necessary to a painter in this country, he was obliged to betake himself to that employment (for a whole length he was paid sixty guineas) much against his inclination; yet the English never perhaps were less in the wrong in insisting that a painter of history should turn limner, the barrenness of Amiconi's imagination being more suited to the inactive tameness of a portrait than to groups and expression. The Duke of Lorraine, afterwards emperor, was then at London, and sat to him. He drew the queen and the three eldest princesses, and prints were taken from his pictures, which he generally endeavoured to emblemise by genii and cupids. In 1736 he made a journey to Paris with the celebrated singer, Farinelli, and returned with him in the October following. His portrait of Farinelli was engraved. He then engaged with Wagner, an engraver, in a scheme of prints from Canaletti's views of Venice, and, having married an Italian singer, returned to his own country in 1739, having acquired here about 5,000%. At last he settled in Spain, was appointed painter to the king and died at Madrid, September 1752. Amiconi's daughters, the Signora Belluomini and the Signora Castellini, the latter a paintress in crayons, were living at Madrid in 1773. Brunetti, an Italian, who had arrived before Amiconi, and was a painter of architecture and ornaments, assisted the latter at Lord Tankerville's and other places, and painted scenes for the opera. He etched some plates of grotesque ornaments, but left England for want of business.

The "Clytie" Bust.

The fine bust in the British Museum which is popularised by plaster and parian busts owes its title of "Clytie" to Charles Townley, who purchased it in 1772 from the Laurenzano family at Naples. It was called "A Grecian Lady" and also "Isis resting on the Flower of the *Nymphaea lotus*." The heliotropium, which the petals resemble, was not known in Europe until after the discovery of America. On the Greek fictile vases of the Macedonian period female heads issuing from the calyx of a flower frequently occur. The original motive of such combinations is probably funereal. In Stackelberg, "Gräber d. Hellenen," is engraved the upper part of an Athenian *stele*, in which a veiled female bust is represented rising out of the floral decoration which forms the usual ornament of this class of monument in Attica. The bust is evidently the portrait of a Roman lady of the Augustan age. The forehead is low, which, as we learn from Horace, was then thought a special characteristic of a beautiful face. The arrangement of the hair, waved in front and falling over the back of the head, suggests a likeness to Antonia, the mother of Germanicus, but it is, perhaps, intended for Agrippina, the wife of Claudius. The type is more refined and the expression more highly wrought than is usual in Roman portraits, but seems quite in harmony with the general spirit of the Augustan age. The bosom is thrown a little forward, as if the bust had been copied from a statue seated in a chair. This bust is in the finest condition, the only parts restored being two of the leaves of the flower.

The Council of University College, London, have purchased a site facing the hospital for the erection of a clinical school. Plans have been drawn by Mr. Waterhouse for the buildings. Negotiations have been begun for the acquisition of a site for the boys' school. A sum of 40,000% is required for the building of the clinical school and 60,000% for the boys' school.

Fire Prevention Committee.

SIR,—Will you kindly announce in your next issue that I have resigned the chairmanship of the Commercial Section and membership of the Executive of the British Fire Prevention Committee, and also the title of Hon. Publications Secretary of the International Fire Prevention Congress?—Yours faithfully,
F. R. FARROW.

July 7, 1903.

GENERAL.

The King has expressed the wish that the gold ornaments which were the subject of litigation should be presented as a free gift to the treasurer of the Royal Irish Academy.

The Board of Education have arranged that the Exhibition of British Engraving and Etching, in the galleries of the Victoria and Albert Museum shall remain open until September 30 next.

The Top Stone of the central tower of Truro Cathedral was laid last week. The tower will cost 15,000%. Except for the two western towers, which are estimated to cost 7,000% each, and will not be proceeded with until the cost is offered to the cathedral authorities, Truro Cathedral is now complete.

The Votes which will be applicable for naval works during the present and the next financial year are:—Chatham dockyard extension, 50,000%; Sheerness depôt for torpedo-boat destroyers, 143,000%; naval establishment at Rosyth, 200,000%; coastguard stations and Royal Naval Reserve batteries, 50,000%; torpedo ranges, 75,000%; and electric light and power in naval establishments, 713,000%.

The French Senate adopted the Bill authorising the Government of French West Africa to borrow 65,000,000 francs for public works, with an amendment, made by the Chamber, reserving the contracts for French manufacturers.

The Metropolitan Railway Company have abandoned the intention to appeal against the magistrate's decision that railway companies were amenable to the local authority, and that the sanitary work at the Finchley Road station was irregular as no notice had been served. Mr. Curtis Bennett's decision will be accepted.

The Institution of Civil Engineers will receive applications for the Palmer scholarship. The nominee must be the son of a civil engineer, he must be desirous of matriculating and subsequently graduating at the University of Cambridge, and his circumstances must be such as to need the help afforded by the scholarship.

The Southwold Town Council have decided to make inquiries as to the powers of the Corporation to manufacture bricks for sale with a view to starting such an enterprise in the autumn.

The Museums and Lecture Rooms Syndicate of Cambridge have commenced the erection of a new drawing-office for the department of Engineering. Professor Ewing, in his report, refers to the need of new workshops for the department of Mechanism and Applied Mechanics, for the erection of which about 10,000% will be required. An engineer, much interested in training men for his profession, has promised to give one-fourth of this sum if the remaining three-fourths are obtained. Subscriptions have been received amounting to 1,650%. The Professor trusts that the remainder of the fund may soon be forthcoming now that a site has become available, for the need of new workshops is increasingly pressing. The steady growth of this department continues, and the Professor sees no reason to expect that it will not go on, for there is an increasing appreciation on the part of engineers of the advantages of the training in applied science which such a course affords.

An Exhibition of mezzotints will be held at the British Museum next year. The material will be mainly derived from the recently demised collection of Lord Cheylesmore. The works will range from the time of the invention of Ludwig von Siegen down to the works of Samuel William Reynolds, Turner and Say, before the introduction in 1820 of the steel plate instead of copper.

The Westminster City Council have complied with a suggestion contained in a letter from the London County Council, stating that they were endeavouring to give effect to their undertaking to obtain possession of the premises at present occupied by lessees and required for the widening of Piccadilly, but that it was found that it would considerably assist the negotiations with the tenants if the city council would aid by putting into force, at the cost of the County Council, its statutory powers under Michael Angelo Taylor's Act. The County Council possess no such compulsory powers for the acquisition of property as those conferred on the city council by the Act in question.

THE

Architect and Contract Reporter.**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000*l.* inclusive. Premiums of 30*l.*, 20*l.* and 10*l.* will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

CONTRACTS OPEN.

ACCRINGTON.—July 14.—For the erection of bank premises, Blackburn Road, Accrington. Mr. Henry Rose, architect, 15 Cannon Street, Accrington.

ASHBURTON.—July 18.—For additions to the grammar school. Mr. R. E. Tucker, clerk to governors, Ashburton.

BANBURY.—July 13.—For the erection of an outside iron fire-escape staircase at the workhouse. Mr. E. Lamley Fisher, clerk to Guardians, Union Offices, Banbury.

BARNSELEY.—July 13.—For the erection of two houses in Blackburn Lane. Mr. James Clarke, builder, 107 Doncaster Road, Barnsley.

BATLEY.—July 15.—For the erection of a new foundry in Bridge Street. Mr. Harry B. Buckley, architect, 85 Commercial Street, Batley.

BEBINGTON.—July 20.—For additions and alterations to the sexton's lodge at Bebington cemetery, Bebington, Cheshire. Mr. William Griffiths, architect, 5 Hamilton Square, Birkenhead.

BEDALE.—July 13.—For additions and alterations to Hopetown House, Leeming Lane, Carthorpe, near Bedale. Messrs. Thomas Winn & Sons, architects, 92 Albion Street, Leeds.

BIGGLESWADE.—July 14.—For the erection of vagrants' ward, disinfecting chamber, work-sheds, &c., at the workhouse. Mr. J. Owen Jones, Shortmead Street, Biggleswade.

BINGLEY.—July 17.—For the erection of a Wesleyan chapel at Gilstead, Bingley, Yorks. Mr. Wm. Rhodes Nunn, architect, Market Street, Bingley, Yorks.

BRIERFIELD.—July 14.—For the erection of a police station and courtroom at Brierfield, Lancs. Mr. Henry Littler, architect, County Offices, Preston.

BRIXTON.—July 16.—For the erection of a pair of cottages on Sherford Farm, Brixton, Devon. Messrs. Pitts, Tucker & Sons, Barnstaple.

BROADHEMPSTON.—July 18.—For the outward renovation of the Broadhempston Wesleyan chapel. Mr. Johns, Woodbine Villa, Broadhempston.

BROWNHILLS.—July 14.—For the erection of a wing to the public buildings, Brownhills, Staffs. Mr. W. B. Chancellor, surveyor, Public Buildings, Brownhills.

CARLISLE.—July 13.—For alterations to the Crown Court, Carlisle. Mr. Geo. Dale Oliver, county architect, Carlisle.

CLECKHEATON.—July 16.—For the erection of four terrace houses, Whitcliffe, Cleckheaton, Yorks. Messrs. R. Castle & Sons, architects, London City and Midland Bank Chambers, Cleckheaton.

DALTON-IN-FURNESS.—For completing the new Carnegie free library. Mr. W. Richardson, surveyor, Council Offices, Dalton-in-Furness.

"Holidays in Belgium and the Ardennes" is the title of a prettily illustrated brochure by Percy Lindley, which is being issued by the Great Eastern Railway. It is descriptive of inexpensive holidays, *via* Harwich and Antwerp, in Flanders and the Ardennes. A special feature has been made of the tinted illustrations, which are effective and artistic.

New Sunday schools in connection with the Independent Methodist church, Barton Road, Stretford, have been opened. The schoolroom provides accommodation for about 600, and there is a lecture-hall capable of holding about 250, besides nineteen vestries for classes. The total cost is 3,250*l*. Mr John Bowden was the architect.

NEW CATALOGUE.

MESSRS. ROWLAND, CARR & Co. have sent us a copy of their new illustrated catalogue of cast and wrought-iron stairs. It is a handsomely got-up volume, and abounds in designs for simple and elaborate stairs, handrails, balustrades, newel posts, &c., some of them being of considerable grace and attractiveness. A large proportion of the designs are, however, for fire-escape staircases adapted for hospitals, lunatic asylums, work-houses, factories, stores, theatres, &c. These, while for the most part of the utmost simplicity, are eminently practical and economical alike of cost and space.

TRADE NOTES.

KEIGHLEY parish church, Yorks, is to have a new clock and chimes. Messrs. Wm. Potts & Sons, clock manufacturers, Leeds, have the work in hand, and it is to be completed at an early date.

THE new drill-hall at Chelmsford, which was opened on Saturday last by Lord Roberts, has been glazed with glass 10 feet 3 inches long by 24 inches wide, and for this purpose Messrs. Sam Deards', Ltd., special strong glazing bar, galvanised and lead covered, was adopted.

THE British Steam Specialties, Ltd., in addition to their head-office at Leicester, have opened showrooms and stores, &c., at 73 Farringdon Road, London, E.C., for their well-known specialties, and also for the sale of the plumbing, wood and other goods of the Exhibit and Trading Company.

THE mosaic in the entrance to the Ulster Hall, Belfast, into which is introduced the Belfast coat-of-arms, was laid by Messrs. Diespeker, Ltd. (formerly Diespeker & Co.), Bath House, 57-60 Holborn Viaduct, for Messrs. Young & Mackenzie, architects, Belfast. Messrs. Diespeker are also laying the mosaic in Purdysburn asylum, near Belfast, for Messrs. Graeme, Watt & Tulloch, architects, both these contracts having been secured in competition.

THE fifty-second annual report of the Birkbeck Building Society shows that the surplus profit on the year's working after writing off all ascertained losses is 21,197*l.* 7*s.* 3*d.*, which, added to the previous year's total of 308,576*l.* 6*s.* 6*d.*, makes a sum of 329,773*l.* 13*s.* 9*d.*; of this amount the directors have placed 25,000*l.* to the permanent guarantee fund, raising such

fund to 250,000*l*, the whole of which is invested in Consols. These funds together amount to 554,773*l*. 13*s*. 9*d*.

It is interesting to note in connection with the Gordon-Bennett Cup race that the tents occupied by the timekeepers and route guardians were supplied by the Willesden Paper and Canvas Works, Ltd., and also that the flags—triangular and square—having direct signalling significance were made of Willesden paper. This latter was necessary owing to the curling propensities of ordinary bunting. Willesden canvas was also much in evidence in connection with car covers, &c.

ELECTRIC NOTES.

PROVOST MURCHLAND has received intimation from London that the King has given the Royal assent to the Electrical Lighting Bill promoted by the Corporation of Irvine. The order provides, amongst other things, for the lighting of the streets in the burgh by electricity.

AT a meeting of the electric-lighting committee of the Arbroath Town Council a report was submitted which showed that the cost of laying the electric light in the compulsory area under the provisional order would be 20,000*l*, and that at the end of two years it would be optional on the part of anybody outside the compulsory area to apply for its extension, which would make the cost 40,000*l*. It was moved that for financial reasons, and in the prospect of the introduction of a large scheme of water supply, the best possible terms be arranged with a company for carrying through the work. As an amendment it was moved that sectional offers be obtained before a definite conclusion was come to. The motion was carried by a majority.

THE new electricity-generating station erected by the Oldham Corporation at Greenhill, in the centre of the borough, has been formally opened. The estimated cost of the works is from 156,000*l* to 157,000*l*. The first station was erected by the Corporation in 1892, and four years later found enlargement necessary. In 1900 power was needed for the tramway service, as well as further power owing to the growth of the general demand for electricity, and the site at Greenhill, with a superficial area of 112,700 feet, was obtained. The plant installed in the engine-room at present totals 6,000 horse-power, and without additional buildings it will be possible to add another 4,800 horse-power. When required, it is proposed to add

a third bay to the engine-room to contain four 2,500 horse-power sets, while if the buildings are extended according to the present proposals, the total capacity of the complete station will be approximately 20,000 horse-power, the whole of the site being then utilised.

A MEETING of the electric-supply committee of the Birmingham City Council was held on Wednesday at the Council House, under the presidency of Mr. G. H. Johnstone, to select a candidate for recommendation to the City Council for appointment as city electrical engineer in the place of Mr. J. C. Vaudrey, who has resigned. Originally there were seventy-nine applicants for the office, to which is attached a salary of 1,000*l*. a year. A sub-committee reduced the number of candidates to eight, who were interviewed, and four were selected to come before the full committee. These four were Mr. Victor A. H. McCowen, Belfast; Mr. Francis Thursfield, Chester; Mr. R. A. Chattock, Bradford; and Mr. A. S. Giles, Blackburn. These gentlemen had an interview with the committee, and as a result it was unanimously resolved to recommend the Council to appoint Mr. R. A. Chattock, a local man, the son of Mr. R. S. Chattock, the well-known artist.

BUILDING AND BUILDERS.

THE new English Presbyterian chapel at Holywell was opened on Wednesday. It has been built at a cost of 3,000*l*.

THE foundation-stones were laid on Saturday of a new Wesleyan chapel, to seat 680 people and to cost 4,000*l*, in High Park, Southport.

PROVISIONAL arrangements have been completed for the erection of new fire stations in Kilburn, Bayswater and Eltham.

THE ancient church at Bassaleg (Mon.) is undergoing thorough restoration, the cost of the entire work to the nave and aisles being defrayed by Lord Tredegar.

THE foundation-stone has been laid of a new church at Grangetown, Yorks. It will be of Gothic design, 108 feet in length, 50 feet in width and 47 feet in height. There will be seating accommodation for 600 people.

OWING to the refusal of the Wood Green Council to pass plans of the Artisans, Labourers and General Dwellings Company, which are not in accordance with the by-laws, no fewer than 300 men have been deprived of employment. The

councillors argue that the company know what the by-laws stipulate, and, while being sorry for the men, they have no power to sanction plans which do not comply with the requirements.

On the 1st inst the foundation-stone was laid of a new Free Methodists' chapel which is in course of erection in Portland Street, Lincoln. The new building, which will be of brick with stone dressings, is to be both longer and wider than the present one, and seating accommodation will be provided for 320, compared with 200 in the school chapel now in use.

At a meeting held recently in Manchester a committee was appointed to deal with the question of holding a Manchester international exhibition in 1905, the meeting having first resolved that such an exhibition was desirable. Circulars have been sent out on the matter, and when the replies have been received they will be laid before the Lord Mayor with a request to him to call a town's meeting to consider the question.

SCHEDULES are now being prepared for the work in connection with the erection of new post office buildings at Alexandria, N.B. About three years ago a site was secured between the Constitutional Club buildings and the railway, but for monetary reasons the Post Office authorities delayed proceeding with the work. Now that it has been decided to get tenders for the job, it is not expected there will be much further delay.

SOME discussion took place at a recent meeting of the Dundee Town Council on a scheme to improve the central washhouses at a cost of 1,200/, proposed to be taken from the Common Good. Treasurer Ritchie objected to the expenditure, stating that the Common Good was already overdrawn to the extent of 2,000/, that the proposed expenditure would unbalance the finances, and that the system of mortgaging the Common Good meant that they had to pay overdraft interest. Various members stated that the Common Good had often been used for purposes not nearly so useful to the community at large, and that, indeed, the money had sometimes been frittered away. By thirteen votes to nine it was decided that the proposed expenditure should be made.

THE first contract in connection with the new naval establishment on the Firth of Forth, which has been entrusted to Messrs William Bain & Co, Lochrin Ironworks, Coatbridge, is for the erection of a suite of offices for the Admiralty staff, who will supervise the extensive works that have to be carried

out. The buildings, although substantial, will be of a temporary character. They are to be of one storey, and consist of a timber framework covered with corrugated iron and resting on the ordinary concrete foundation. The premises comprise drawing office, surveyors' and civil engineering rooms and other departments. Detached from the group of offices is the caretaker's house, which is to be similar in construction. The offices will be heated in the winter with stoves. A feature of the construction will be the use of uralite for lining the inside of the erections. This substance is thoroughly fire-proof, and is applied in the form of a lining of thin slabs. The new buildings will cost several thousand pounds. A representative of the firm has visited the ground to make the preliminary arrangements. It is understood that the material is already in course of preparation at the Lochrin Ironworks, and that the erection of the offices will soon be commenced. Several West of Scotland companies are offering for the construction of a branch railway line to St. Margaret's Hope.

IN February last competitive designs for a Baptist church and schools in High Street, Ilford, were received by the committee, who, after mature deliberation and on expert advice, have selected the design submitted by Messrs. G. & R. P. Baines, architects, 5 Clement's Inn, Strand, London, W.C., for the premium. Circumstances have transpired since the competition was promoted which prevent the committee from proceeding at once to build, and the matter is therefore postponed for the present. The selected design provides for a church to seat about 860 adults, with the usual vestries, &c., and a school with large central hall, with many classrooms opening into it, divided by swivel partitions, seniors and infants' classrooms, kitchen, &c., all on the most recent model plan. The whole scheme is estimated to cost upwards of 8,000/. The style is Perpendicular. The buildings are to be faced with red bricks with Bath stone dressings.

THE foundation-stones of the Wesleyan chapel at Finedon have been laid. The building, which is expected to be completed for opening next Easter, is designed to seat about 550 persons, 450 on the ground floor and 100 in an end gallery. The style of architecture is Early English. The plan is cruciform, with nave, side transepts and chancel. The choir will be in the chancel, and behind the choir will be the organ chamber. The minister's vestry and choir vestry are to be at the side, in proximity to the choir. The church will be entered by an open porch leading into a large vestibule, and on either side there will be inner lobbies containing the gallery

staircases. Separate entrances are provided at the back for the minister and choir, and a cloak-room is also provided at the front entrance. The dressing-room and all the stonework will be in Bath stone. Externally the walls will be faced with Skelford pressed bricks, whilst the roofs will be covered with green slate. Internally the walls will be plastered, the wood-work being of pitch-pine, with wood-block floors. The stone traceried windows will be glazed with tinted glass of special design in leads and moulded stonework in strings. The paving to the vestibule and inner lobbies will be in mosaic. The contract has been let to Mr. R. Marriott, of Rushden, at 2,800*l*, and the architects are Messrs. H. H. Dyer, Son & Winterburn, of Northampton and Leeds.

VARIETIES.

ST. ANDREW'S, Frogna, Hampstead, a new Presbyterian church, was dedicated on the 4th inst.

THE new Prospect Hill Presbyterian church, Walthamstow, is being erected under the supervision and from the designs of Mr. J. Williams Dunford, of 1000 Queen Victoria Street, London.

MR. SELBY, architect, of 44 Chancery Lane, announces that he has taken Mr. A. V. Kislingbury into partnership, and that the practice will be carried on in future under the title of Selby & Kislingbury.

THE Southwold Town Council has, we hear, decided to make inquiries as to the powers of the Corporation to manufacture bricks for sale, with a view to starting such an enterprise.

THE Lord Mayor of Manchester (Councillor Royle) on Saturday afternoon opened the new schools in connection with the Upper Moss Lane Primitive Methodist church, Hulme. The schools provide accommodation for 750 scholars, and their cost is 4,000*l*.

THE new Wesleyan church at Girvan, which has been erected at a cost of 2,640*l*, and is seated for 430, has been formally opened. It is situated on a fine site in a central position in the town, and has a vestry and classrooms and all modern conveniences.

THE International Fire Prevention Congress having sent a telegram to the King, Lord Knollys has replied that His Majesty trusts the deliberations will lead to a further develop-

ment as to the best means to be adopted in regard to the prevention of fire and to the saving of life in cases of fire.

THE Society of Estate Clerks of Works, which embraces branches in different parts of the country, held its annual summer meeting in Liverpool and district. On Tuesday the members visited Knowsley, where, at the invitation of Lord Derby, they had lunch, after which there was a ramble through the village, with an inspection of the parish church. On Wednesday the party, numbering about ninety, went through the Liverpool docks, and also the offices of the Dock Board, whilst a visit was made to St. George's Hall. In the afternoon the Lord Mayor (Mr. W. M. Rutherford, M.P.) received them at the town hall and provided tea, the rooms of the building being thrown open for them to inspect. Later in the day the party proceeded to the Canada dock, and were conducted through the White Star liner *Celtic*. Yesterday's programme, which concluded the meeting, embraced visits to Speke Hall and Port Sunlight. The president of the Society is Mr. J. Leslie, Knowsley.

AT Preston, on Wednesday, Lieut.-Colonel Smith, R.E., held an inquiry into the application of the Lancashire Inebriates Acts Board for sanction to borrow 60,000*l* for the purposes of an inebriates' home for females at Langho, near Blackburn. Mr. Clare, clerk to the County Council, explained the scheme. Buildings had already been erected to accommodate 112 women, and without any further expenditure on administrative buildings the accommodation could be doubled. Statistics proved that there were a far greater number of habitual female than male inebriates coming before the courts of law. It was therefore decided to commence building a reformatory for women without delay. At present the county had twelve male and ninety-three female inebriates in other homes. The male and female blocks would be 400 yards apart, and the total cost of the female reformatory, including twelve houses, a chapel, sewage and other arrangements, would be 73,418*l*. Three hundred and twenty acres of thickly wooded land had been purchased at a cost of 17,500*l*, the average cost being 52*l* per acre. The land was well watered, very private, and was eminently suited for the purposes of an inebriates' home. The drainage would cost 4,000*l*, but this work had not been completed.

THE new police buildings at North Walsham were formally opened on the 30th ult. The commodious building, which is situate on the Yarmouth Road, has been erected by the County

Council at a total cost of 4,400*l.*, exclusive of the land. The whole enclosure is screened off from the road by railings mounted upon a dwarf wall. To the left, in a single block, are the residences of the police superintendent and a sergeant. To the right stands the court-house, a substantial building in red brick, with stone window dressings, and a round-headed doorway of white stone for the main entry. Passing through this portal, one finds, on his right and left respectively, rooms for witnesses and solicitors; then comes the police-court proper, with a suite of retiring-rooms for the magistrates, and further back lie the stables and the cells. The flooring is of wood blocks, upon which at one end is a low platform to accommodate the seats of the magistrates and the table of the magistrates' clerk, who has the witness-box upon his right. Immediately below the clerk are a couple of tables for counsel. Further along is a 'capacious dock, with a deck' for the gaoler, and behind the dock are three or four rows of benches for the general public. The contractors for the work are Messrs. Youngs & Son, of Norwich, who carried out the design under the supervision of Mr. T. H. B. Heslop, the county surveyor.

THE church of St. Nicholas Overstone, Northants, has just undergone a very complete restoration undertaken at the expense of Lady Wantage, who has evinced the utmost interest in its progress. The church, which is pleasantly situated, was built in the year 1803 without any regard to architectural treatment either externally or internally, and consisted of a tower, nave (with gallery at the west end), a small chancel and vestry. The present alterations and additions, which have been carried out in an excellent manner, consist of a south aisle, organ-chamber, vestry and porch. The tower, which was much dilapidated, has been reroofed and new battlements and windows provided; the bells have been rehung with an addition of one; the lower portion of the tower now forms a baptistery; a new chancel arch in stone has been substituted for the old plaster arch and brought a distance of 3 feet into the nave to enlarge the chancel and to give the required accommodation for the choir, and the original plaster ceiling and cornice in the chancel have been replaced by a new ceiling divided into panels with moulded oak ribs and carved bosses. The reredos, altar-rail, prayer-desk and choir-stalls are all in fine wainscot oak, and selected pitch-pine has been used for the seating of the nave and aisle. The glazing throughout, with the exception of a portion of the east window of the chancel, in which has been reset some very old German stained glass, is entirely new, and the chancel, baptistery, aisle

and porch have been paved with terrazzo marble mosaic, wood-block paving being used in the organ-chamber, vestry, &c. A new heating apparatus has also been provided.

FIXING STONE SKIRTINGS.

A PATENT has been granted to Mr. William Ford Stanley, of Cumberlow, South Norwood, in the county of Surrey, engineer, for improved means for fixing stone skirtings to the walls of buildings. The object of the invention is to provide means for more perfectly securing stone skirtings to the walls of buildings than heretofore. Each piece of the skirting is grooved at each end, and into this groove a metal tongue is fitted. For straight joints this metal tongue is of the width of the two grooves abutting, and when the stone, slate or marble skirtings are fitted thus together the metal tongue is not seen. Upon the wall of the building in a position where each joint takes place a metal plate is fixed, and the skirtings are screwed to this metal plate by means of a screw or screws passing through the metal tongue, and in this case the metal plate fixed into the wall is flat. For an exterior angle the metal tongue is curved so as to enter both ends of the stones which form the skirtings perpendicularly, and screws are passed through this curved tongue into the angle piece of metal to firmly fix it into the wall behind it. This tongue remains visible, and forms a semi-circular or curved termination to avoid the angle of the stones being continued to sharp corner. For interior angles the ends of the stones are mitred without any grooves, and a curved piece of metal is fitted in front, which is screwed to a metal internal angle piece firmly fixed in the wall. The object in all these jointings and fixings is to place the substance of the stone between two metal surfaces, one of which is previously fixed to the wall so as to grip the stone skirtings between the metals firmly.

A FAREWELL DINNER.

ON Saturday evening, at the Pagan's Restaurant, Great Portland Street, Mr. H. C. Eyres, who for the last seven years has been architectural manager to the Falkirk Iron Company, London, was, on leaving to join the firm of Messrs. Longden & Co., entertained to dinner by Mr. Alsop, the general manager of the Falkirk Company. The dinner took place in the large private dining-room, after which an adjournment was made for coffee and cigars to the almost world-known

"Artists' Room," full as it is of productions and autographs of so many artists of repute. All the chief officials of the firm were present. The toast of the health of the partners of the Falkirk Iron Company and their continued success was cordially drunk, after which Mr Alsop, who occupied the chair, proposed the health of the guest of the evening. He expressed the regret of himself and all present at the severance of a connection which since its beginning had been so very pleasant, in which he mentioned the indebtedness of the firm to Mr. Eyres for initiating and carrying through a large number of excellent designs, which had considerably raised the standard of the firm's work, especially suited for the requirements of architects. The Chairman assured Mr. Eyres that he carried with him into his new sphere the heartfelt wishes of all for a happy and successful career, and the recollection of his sojourn among his many friends in the Falkirk Iron Company would always be most pleasant. Mr. Eyres had endeared himself to all by his kindly and gentle nature, and all united in wishing him God speed. The health of Mr. Eyres was then enthusiastically pledged.

Mr. Eyres, in replying, said:—I had put into my mind a few words to say to-night, but the more than kind words of my friend and chief have so deeply touched me that I feel very unsure of myself or of my ability to find words to express my thanks. Mr. Alsop and colleagues, I need scarcely say to you that this parting of the ways marks for me a new epoch in my life. Now, frankly, to my instinctive conservatism changes of most sorts are unattractive, and the actual severance of any ties, particularly those which are pleasant ones, is a burden of the flesh to me. Thanks, however, to the ever-resourceful and kindly thought of our chief, he and you have determined that at the precise point where our roads divide there shall be set up a souvenir of your goodwill, conceived in the happiest possible manner, a manner dear to the heart of Englishmen in the form of this reunion. I am deeply touched, and I am sincerely grateful to you for the great honour you have thus done to me, and I trust that the future may have in store for us many other opportunities for the exchange of friendly thought. I am proud to think that my life so far has been spent in the service of two such companies as the Coalbrookdale and the Falkirk Iron Company, and to know that I have retained the real friendship of the good men and true who have kept both companies in the premier positions they still hold. Long may they flourish. For our own, I am glad to know we have recent proof of its progress. To have

doubled the turnover of the company in fourteen years, as has been the case with the Falkirk Iron Company under the general management of my good friend Mr. Alsop, who we are glad to see in such excellent form to-night, is very gratifying, and we all wish the firm continued success with the large extensions and improvements they have in hand for early execution, and which there can be no doubt will be attained. Mr. Alsop and friends all, I thank you from the bottom of my heart, and I shall carry with me into my new environment the happiest possible recollections of this happy evening, and of you who have made it so.

A most delightful evening was brought to a close by the health of the chairman being proposed by Mr. Lemaire, who occupied the vice-chair, and cordially responded to by all present.

SANITARY INSTITUTE.

THE Congress which was opened at Bradford by His Worship the Mayor of Bradford on the 7th inst. promises to be a great success. The exhibits are fully up to the standard, and there are many sanitary improvements worthy the attention of our readers. The following list of awards have been made by the judges:—

Silver Medals.

The Bradley Star Tap Co., for equilibrium and compensating ball, bib and meter taps; British Sanitary Co., for self-acting earth closet; Burn Bros., for cast-iron drain pipes and fittings; F. C. Calvert & Co., for carbolic acid preparations; Davis Gas Stove Co., Ltd., for diamond metropolitan cooker; J. Duckett & Son, for isolated siphonic closets; Chalmers & Co., for dust van; W. Glover & Son, for new roadway water sprinklers; W. Glover & Son, for dust van; Horsfall Destructor Co., Ltd., for portable destructor; Northern Vacuum Cleaner Co., Ltd., for vacuum cleaners; Wilson & Stockall, for brougham ambulance with convertible stretchers; Wilson & Stockall, for accident ambulance van.

Bronze Medals.

Ames Crosta Sanitary Co., for trapped drain box for tramway rails; Ames Crosta Sanitary Co., for stoneware conduits for electric cables; Ames Crosta Sanitary Co., for surface-water gullies; Anti-Vibration Incandescent Lighting Co., for anti-vibration incandescent gas lamps of various patterns; Burn Bros., for square gully plug; Burn Bros., for "Times" drain plugs; Joseph Cliff & Sons, for "Newcliff"

PORTLAND CEMENT TESTS.

A REPORT was submitted by the committee on standard specifications and tests for Portland cement at the last annual meeting of the Canadian Society of Civil Engineers. It recommends that all experiments shall be carried on as nearly as possible at a uniform temperature of 65 degrees

Fahr, except when tests are being made for the purpose of ascertaining the comparative strength of cements required for winter use. All proportions shall be determined by weight. A maximum residue of 10 per cent. shall be retained on a sieve of 10,000 meshes to the square inch, and the whole of the cement shall pass through a sieve of 2,500 meshes to the square inch. A mechanical sifter, working automatically by jig motion, is recommended. In the case both of hand and mechanical sifting the process shall occupy a definite time, depending upon the weight to be sifted and the diameter of the sieve. For example, with a weight of 10 ounces of cement and sieves 8 inches in diameter, the sifting shall be continued 2½ minutes on No. 120 sieve, 1 minute on No. 100, ¾ minute on No. 80, and ½ minute on No. 50. The introduction of small weights into the cement, while being sifted, is to be deprecated, as they tend to push an undue proportion of the cement through the mesh, to stretch the wires, and to increase the grinding. The sand for standard tests shall be quartz, crushed so that the whole can pass through a sieve of 400 meshes to the square inch, but sufficiently coarse to allow of the whole being retained by a sieve of 900 meshes.

The specific gravity test is to determine the degree of calcination with certainty, and is therefore of great importance. The specific gravity of a Portland cement shall be at least 3.09, and shall not exceed 3.25 for fresh cements, by "fresh" meaning cements not more than two months' old. The gravimetric system is recommended. Portland cement improves with age, provided it is properly stored and kept in air-tight bags or barrels. Specifications therefore should not prescribe only fresh cement.

The hot-bath test for detecting free lime, &c., shall be carried out in the following manner:—Mortar pats, prepared of neat cement and thoroughly worked, shall be trowelled upon ground glass plates (carefully cleaned, preferably with acid) about 5 by 2½ inches and ¼ inch thick. The pats shall be about ½ inch thick in the centre, and worked off to sharp edges on the four sides of the plate. They shall then be covered with a damp cloth and allowed to remain in the air until set, after which they shall be placed in vapour in the Fajja bath tank, in which the water is to be heated to a temperature of about 130 degrees Fahr. After remaining in the vapour for six hours, including the time taken to set in air, they are to be immersed in hot water for eighteen hours. Upon their removal from the bath, the samples should not be curled up, should not have fine hair cracks nor be distorted, and should not have large expan-

STRIPSO

In 7, 14, 28 and 56 lb. kegs.

Quickly and thoroughly removes PAINT, VARNISH, STOVE ENAMEL, RUST or GREASE, however old or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

Saves more than half the ordinary cost of stripping Paint and Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer.

Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,

13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white-Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRAN, Yacht Builder.

Nimsquarter, Kirkcubbin, Co. Down, June 24, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.
11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. E. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.

JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST,
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.

sion cracks. The samples should break with a sharp crisp ring. Cements when very finely ground, even if slightly over-limed, are not so liable to blow.

The time of setting shall be determined by noting the time required for a sample to bear a needle of 1-12-inch diameter loaded with one-fourth of a pound, and 1-24 of an inch diameter loaded with one pound, the mortar under test being of the consistency of rather stiff plaster. The percentage of water used shall be stated in the report. For more accurate determination a brass or rubber mould, 10 centimetres in diameter and 4 centimetres high, is filled with neat cement, mixed to such a plastic consistency that a plunger of 1 centimetre diameter and loaded with 300 grammes penetrates to a point 6 millimetres from the bottom. Setting commences when a needle of 1 square millimetre section first refuses to sink entirely through "the mould." Setting is complete when the needle rests upon without penetrating the surface.

Tensile and compressive tests of neat cement, except where fineness, specific gravity and hot-bath blowing tests are also made, are misleading. Briquettes of neat cement, in which these characteristics have been found satisfactory, shall bear a tensile stress of 250 lbs. per square inch at the end of three days, 400 lbs. at the end of seven days, and 500 lbs. at the end of twenty-eight days. All briquettes shall be one day in damp air and submerged in clean water for the remainder of the time. Any cement which shows a decrease in strength on or before the twenty-eighth day is to be rejected. The decisive tests shall be considered as the average of five briquettes, although for ordinary practice two or more briquettes may be sufficient, and in the latter case only the highest test of the group is to be taken as the strength of the cement. In determining the tensile strength the area of the broken surface shall be measured with great accuracy, as errors exceeding 10 per cent. are otherwise possible.

In sand tests, the sand and cement must be thoroughly mixed dry. After the water has been added, either for neat or sand tests, the mortar shall be thoroughly mixed for a uniform time; suitable periods being two minutes for machine mixing and five minutes for hand mixing. Briquettes made of one part cement and three parts sand shall bear a tensile stress of 125 lbs. per square inch after submersion for six days, and 200 lbs. after twenty-seven days. At the end of the same period the minimum compressive strength of a mixture of one part cement to three parts sand shall be 2,000 lbs. per square inch. The tensile strength of briquettes, mixed in the propor-

tion of three to one, or of other sand briquettes, shall not show a decrease either on the twenty-eighth day or subsequently. In every case the quantity of water used in mixing shall be stated in the report. The quantity of water to be used in neat tests varies with the kind of cement, fineness, &c, the correct method being to bring all mortars to the same degree of plasticity. An apparatus, similar to Vicat's, and consisting of a needle having an area of 0.4 square inches, weighted to about 11 ozs. may be used.

A simpler method for determining the standard consistency for neat cement tests is to mould a ball of mortar in the hands to a plastic state and drop the same about 20 inches on to the table. If the ball neither flattens appreciably nor cracks the consistency is satisfactory. This process corresponds practically with the previous method. The water for standard consistency of three to one briquettes shall ordinarily be 10 per cent. of the sand and cement by weight. If the amount of water for standard consistency of neat cement of any particular brand be less than 20 per cent, then the amount of water for standard consistency of three to one briquettes for this particular brand shall be one-half of the amount used in neat tests.

In preparing the neat briquettes by hand the mixture of cement and water shall be thoroughly worked together (preferably in a Faija's mixer) for five minutes. The moulds shall then be filled well above the rim, so that the mortar presents a convex surface. With an iron trowel the mixture shall then be patted, commencing at the side, first gently and then harder until it becomes elastic and water appears upon its surface. No after addition of the mixture shall be allowed. The superfluous cement shall then be removed and the surface smoothed by means of a knife or sharp-edged trowel. The briquettes shall then be placed in a damp chamber (zinc lined) furnished with a lid (also zinc lined) to prevent the irregular drying of the briquettes. After twenty-four hours the briquettes shall be laid in water and kept completely submerged during the whole period of hardening. In preparing the sand specimens five pieces of blotting paper, soaked in water, shall be laid upon a metal or glass plate, and upon each piece of paper there shall be placed a mould, also moistened with water.

If possible, briquettes, prepared as above, shall be subjected to a uniform specified pressure (say, for example, 20 lbs. per square inch) by means of a ram of the same gauge as the moulds, or a Bohmé apparatus may be used. In this case the moulds shall be filled with about 4 lbs. of mortar, and shall be placed in the machine; 150 strokes shall then be applied to

the core with a hammer of about 4½ lbs. in weight. After removing the mould and the core the briquettes shall be smoothed off, taken off the subjacent plate and treated as if hand-made. Doubtful cases should be invariably decided by machine-made briquettes.

Testing machines shall be of the positive lever automatic type, so arranged as to apply the loads quietly and uniformly at the rate of 200 lbs. per minute. Clips with adjustable rubber or paper composition rollers are found to work satisfactorily, and should be used.

Chemical tests and full quantitative analyses are strongly recommended, and preference will be given to cements of which analyses are furnished by the manufacturers. Any cement containing adulteration shall not be accepted as a Portland cement. If there is found to be more than 2 per cent. of sulphuric acid, or 3 per cent. of magnesia, the cement should be rejected. The silica cements are in a class by themselves and need special specifications.

The net amount of cement, deducting the weight of the package, shall be 350 lbs. per barrel. The manufacturer shall give a written certificate with each shipment of cement, stating (1) the date of manufacture; (2) the tests and analyses which have been obtained at the manufacturer's laboratory for cement taken from the day's grinding of which the shipment forms a part; (3) that the cement does not contain any adulteration.

TECHNICAL EXAMINATIONS.

The following are the reports of the examiners of the City and Guilds of London Institute on the building trades:—

Carpentry and Joinery.

It is with regret that we have to again observe that the general standard of the candidates' work leaves much to be desired. The paper was easy, and the candidates were only permitted to answer ten of a total of fifteen questions. In previous years they were allowed to attempt as many of the questions as they could. The innovation was made with a view to preventing hurry and to give a wider field of choice. The arithmetic was better than in most papers of recent years, but was still not good. The plane geometry was by no means good. The simple question in solid geometry was the most commonly neglected of all, and where attempted was generally

very badly answered. The drawing was on the whole distinctly poor. It was inaccurate and showed ignorance of principles. The construction of a plane scale was commonly understood to mean a mere copy of a scale. The drawing of a cupboard front was frequently not attempted, and where it was made was badly drawn. Many who appeared to know what was wanted failed to make the drawing correctly simply because they could not draw. There has been a steady deterioration for some years past in this drawing, and it would appear that elementary mechanical drawing is not satisfactorily taught in by any means all our schools. Too much teaching is attempted with insufficient exercise with the drawing tools.

The grading of the candidates was rather remarkable. Good papers were in sharp contrast to bad ones, and the number of average candidates was comparatively small. This indicates apparently poor preparation in the classes, and the evidence of the papers of many of the failures confirms this view. In many cases it is surprising that candidates should have presented themselves at all. The work of the better candidates shows that at least some very good teaching is given, and the chief fault of the remainder is that they show signs of "cramming" rather than of steady preparation.

Ordinary Grade.

There was a sharp contrast between the good and the bad candidates similar to that noticed in the preliminary, but not quite so marked.

Draughtsmanship was bad. Candidates appeared to know what was wanted, but to be unable to give expression to their knowledge in drawings.

Question 3—The proportions of the mortise to the style of a door were very defective. The joint is of the utmost importance to a joiner, and as nearly all candidates attempted it, this question affords a very sound test as to the thoroughness of the training of the candidates. So badly were the proportions chosen that in a large number of cases no thought at all seems to have been exercised in deciding this important matter. The position of the lock in the answers given frequently involved cutting away the strongest part of the joint made, and consequently weakening the joint in an altogether inadmissible degree.

Question 7. (Six leading joiners' joints.)—Frequently all carpenters' joints were chosen, and where good joiners' joints were taken the proportions of the parts were very faulty. It would be well if teachers would carefully distinguish carpenters'

THE PASTEUR FILTER

from joiners' joints and make their pupils realise their general principles and objects. This is of the greatest importance in a workshop and would render later teaching easier, while at the same time affording opportunities for good drawing lessons.

The sash and frame (sash hung on centres) in Question 6 were frequently correctly made and the whole answer spoiled by the manner in which the beads were cut. Windows made, as too frequently drawn, could not be opened. The simple geometrical problem in this question was clearly not understood.

Questions 13 and 15.—The trusses and bracing in the answers to these questions were used in impossible places, and in actual work would be decidedly detrimental rather than achieving the object of their introduction.

Some 25 per cent. of the papers were, however, really good, and a number of excellent ones were amongst these. Generally the work was better than that of last year, but the old fault—helplessness when deprived of the aid of text-books—was apparent.

The questions were naturally not devised to enable the candidates to perform a feat of mere memory, but to test their intelligent realisation of the principles of the study they had made, or should have made, of the subject.

Honours Grade (Practical).

The specimens of work submitted were as a whole very good, and amongst them were some very fine ones.

The old fault of making small models of large pieces of work was still apparent. These specimens, while they make good teaching models, are not good tests of hand skill.

Preferably candidates should make some detail of work, such as they have to make in a workshop.

Many sent workshop rods with their work, and for the honours stage this custom is better than that of rendering a drawing. The practice is strongly commended.

The practical test contained a difficulty which was left entirely to the candidates' judgment to solve, and on the whole they did well. For a time test the work was of a high character. The draughtsmanship was very good, and a steady improvement has been noticeable during the past few years in this respect.

Honours Grade (Written).

The results of the written examination in the honours grade were in many respects satisfactory, the answers to questions on joinery being rather better than those to questions on carpentry. The drawings were, generally speaking, well

executed, and showed familiarity with the preparation of working drawings.

The tendency to draw and describe what can be got out of text-books in preference to that which would be learned from actual work by an observant craftsman is, unfortunately, too prevalent in the greater number of these papers. For example, the use of timber beams to carry floors over wide spaces has been completely abandoned since the introduction of girders of steel or iron, but in answer to a question on the construction of floors, candidates have constantly shown such beams, and not more than two or three have added that they are now obsolete, while a very small number indeed have shown the method which they must see being pursued in every building of any importance on which they work.

Other answers to questions dealing with centring, with timber partitions and with a timber roof of large span, such as might be used over a drill-shed, include mistakes of the same nature, though it must in fairness be added that these answers also include good honest intelligent work.

Answers to a question inviting the candidate to describe some failure of a piece of carpentry or joinery which had come under his personal observation, and to point out how the defect might have been avoided, brought out, together with some trivial cases, descriptions of serious failures, and shown keen observation and a very intelligent grasp of the situation. Another question referring to dry rot and its cure showed generally a correct knowledge of the proper remedies, but many of the average candidates failed to grasp the very formidable nature of this disease and the great thoroughness with which it must be combated.

Turning to the joinery questions, most of the candidates showed a familiarity with the geometry involved in questions of setting out work (including one piece of somewhat difficult hand-railing) and with the modes of framing joinery and securing it in place. Curiously enough, the greatest variation occurred in answering the simplest problem set, viz. the construction of a set of bookshelves to fit a recess. Some of the answers to this were remarkably imperfect.

The best answers were elicited by a question requiring an important door with its appendages to be drawn, and the process of constructing it in a modern workshop to be described. In answering this question, especially the latter part of it, the candidate had to rely mainly upon his own observations, and the result has been on the whole very satisfactory.

VOLUME LXVIII. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.

For Index of Advertisers, see page x.

In conclusion, it is fair to add that the above remarks, so far as they are of a disparaging nature, apply chiefly to the work of candidates who failed to pass and of those who obtained low marks, rather than to that of the men who are well placed.

Many of the successful candidates are to be congratulated upon having done work which is not only free from any serious defects, but is excellent in its nature and very intelligently set forth both by writing and by drawings.

Brickwork.

In the ordinary grade there was a decided improvement upon the papers of previous years. There were very few candidates who had not attempted at least some of the questions. The honours grade still gives cause for complaint, and it would scarcely seem that the candidates had received the necessary careful instruction.

We again ask that the candidates should be more particularly requested to state where they gained their experience, as this is of great assistance in fairly judging the papers. This is equally necessary in brickwork and in masonry.

Masonry.

The answers in the ordinary grade were very satisfactory. The candidates displayed intelligence and did good drawings. The honours papers were again of a low standard, and it is difficult to imagine that the candidates had previously passed the ordinary grade.

Brickwork and Masonry.

We are sorry to find that so few candidates presented themselves for examination, and recommend that more encouragement should be given to practical men to induce them to endeavour to gain these certificates. With few exceptions the candidates examined did not appear to have been thoroughly prepared. We would urge the necessity of more general training in setting out. Before a student, either in brickwork or masonry, attempts to cut a piece of work, he should, without the aid of the teacher, be able to prepare his own templates, moulds, &c. We found that two institutes went to the trouble of forwarding to the examination centre complete sets of tools for the use of their own candidates. We wish that other institutes would follow this good example, thus enabling their students to take the examination under more favourable circumstances.

Plasterer's Work.

The number of candidates in the ordinary grade is slightly in excess of the number entered last year, and there is a decided improvement in the general knowledge of the trade, as shown by the answers.

With regard to the honours grade I was pleased to find a marked improvement in the answers compared with last session. There were three creditable examples of practical work, but the others were not up to the average.

There seems to be a tendency on the part of the students, or perhaps the instructors, to confine their work to modelling, instead of the more practical and everyday class of work, such as making models of cornices, arches, pediments, columns, panelled ceilings, raking mouldings, piece moulds, &c.

Painters and Decorators' Work.

Ordinary Grade.

The papers are up to the average, although there is distinct evidence in many cases that the students have had little or no practice in writing answers. Teachers are again urged to give exercises in writing answers to questions on practical subjects, so that a candidate who possesses a knowledge of how a particular piece of work should be executed may be able without difficulty to write an answer that will render it clear to the examiners that he actually possesses such knowledge.

Honours Grade.

The written answers to questions this year show a marked improvement, some excellent papers being sent up. The practical work, however, is in many cases far from satisfactory. As more time was given to the preparation of the practical work this year it was expected that considerable improvement would be noticed, but this is far from being the case. The brushwork is in many cases poor. The preparation of stencils does not appear to be properly understood, many of the students having failed to put in sufficient ties to hold the parts of the stencil together. The relief material which was decorated was in many cases most imperfectly done, the worst features of a design being frequently emphasised and the effect produced being decidedly bad. In a few cases the design of the relief material had been carefully considered before decorating it, but this was rather the exception than the rule. Perhaps the most conspicuous fault in the work submitted when considered as a whole was the very poor selection of colours when such selection was left to the students. A room

finished in the colours shown in some of the panels submitted would be far from pleasing in appearance. Most of the students evidently need considerable instruction and practice in the selection of colour combinations for plain work. Some excellent examples of glass gilding were submitted; the lettering was fair and the graining generally good.

AN ABANDONED RAILWAY.

IN the June number of the *Railway Magazine*, a well-illustrated article by Mr. T. R. Perkins describes the condition of the Potteries, Shrewsbury and North Wales Railway.

Passing through Shrewsbury last autumn, after an absence of several years, Mr. Perkins says:—I broke my journey there and visited the remains of the deserted line. I found the Abbey Station buildings converted into a stable, while the space between the platforms has been filled up, and the whole is now used as a coal-dealer's yard. The girders of the old bridge over the Rea brook now lie in the water, while the newer one of brick, built at a higher level to replace it, is already showing signs of dilapidation, and part of the parapet has fallen or been pushed into the stream. The locomotive shed has been demolished, and no trace of the railway is now visible in its vicinity. Halfway up the incline the original permanent way appears, but for some distance the metals have been torn from the sleepers and lie on their sides, still attached in many cases to the chairs. Beyond this the track is complete, and continues so throughout its length.

At Kinnerley, the junction for the Briedden line, the signal-box, close to which is a fallen signal-post, contains fourteen levers, and both it and the water-tank opposite are in a sad state of decay. As for the branch line, which here bears away southward, it has become such a wilderness of trees and bushes that it is almost impossible to trace it. A haystack stands under the road-bridge adjoining the station. Fences have long disappeared, and the whole of the track is thickly covered with undergrowth, so that no rails are visible. In its course of 6 miles the branch runs almost entirely on the ground level, the district being practically flat. At Malverley, 3 miles from Kinnerley Junction, the first station was situated, and here a haystack stands right across the metals. Between this station and the next (Crewe Green) the Severn was crossed by a wooden bridge, the railway passing over it from England

into Wales. This became unsafe before the closing of the line, and afterwards grew rapidly worse, until it finally dropped to pieces and was carried away by the stream, the only portions now remaining being a few upright posts. It being impossible to approach the southern end of the branch from Kinnerley, I left that portion for another opportunity, travelling one bright November morning to Middletown, the nearest station to Criggon, on the Welshpool line. This station stands on the boundary between England and Wales, and is within a few minutes' walk of the cottage where old Parr, the celebrated centenarian, was born. The Briedden rises abruptly above the village, and the walk to Criggon necessitates a stiff climb. The view from the ridge, however, well repays the trouble of the ascent, while the descent into Criggon, which nestles at the foot of the hill on its northern side, is by a precipitous path through a wood, amid surroundings of great beauty. In the centre of a pasture-field stands the little station, the rails emerging from a dense thicket at the end of the platform; in fact, the railway appears like a thick hedge, so dense is the undergrowth which has accumulated through twenty years of neglect. An amusing feature of the scene is the presence of crossing-gates, which, as there is now no fence to the line, stand in an open field, and look most ridiculously out of place. As an instance of the unkept condition of this section, it may be mentioned that in one place, where the high road crosses the railway by a bridge, there are actually growing between the metals trees whose tops reach above the parapets. At the station still stands the little shed which once did duty as booking-office, &c.; but as it has now neither door nor windows it probably serves the purpose of providing a shelter to the cattle feeding in the meadow. The gatekeeper's cottage is now the village post-office.

Such is the story of the unfortunate "Potteries" Railway, which never reached the place from which it took its name, and met a fate without parallel in the railway history of Britain. Judging from the experience of the past, it seems hardly likely that it will ever be quickened into life again, for as yet no "foreign" locomotive has gained admission to Shrewsbury, the stronghold of the two great systems who laid their plans so well more than forty years ago, and who evidently intend to keep their hold upon the traffic of the district. To them the derelict line would be of no use, as every point on its system is within easy distance of one or other of their own stations, and the Cambrian would be hardly likely to risk the friendship of its great "feeders" by seeking to oppose their interests.

JAMES CARTLAND & SON, LIMITED.

MANUFACTURERS OF EVERY DESCRIPTION OF

Cabinet, Builders', Furnishing, & Naval Brass Foundry,

BIRMINGHAM.

MACHINE-MADE BRASS SOCKET BOLTS.

4601		4602
Brass, Iron Shoot.		Iron Back Plate.

THE "INVISIBLE" FANLIGHT OPENER (CARTLAND'S PATENT).

WITH SIDE ADJUSTMENT FOR HEAVY FANLIGHTS. BRASS, 1751½ 1/- each IRON, 1752½ 9d. each

Hinged at Bottom, Opening In.

Brass 1751 4/6
Iron 1752 3/3

For Pivot Sashes.

Brass 1755 4/6
Iron 1756 3/3

Hinged at Top, Opening Out.

Brass 1753 4/6
Iron 1754 3/3

The advantages of this invention will be appreciated by Builders, Architects, and others, as being a perfect Fanlight Opener, without the disadvantage of any unsightly part projecting into the room, to the impediment of blinds, &c. It is equally suitable for sashes hung at top, bottom, or pivot sashes.

THE "GRAPPLER" PATENT SASH FASTENER (Appleton's Patent).

8380. 18/- per dozen.

Strong machine-made, Polished. A turn of the knob causes the Grappler to clutch the catch-plate and secure locks the sashes. It lifts up and draws close together dropping sashes.

The Architect.

THE WEEK.

THE report of the Royal Victorian Institute of Architects is an interesting document. There are now 108 members, of whom fifty-one are fellows. Only seven students have as yet been attracted. The Minister for Home Affairs having expressed a favourable opinion of competitions for public buildings, the Council communicated with other State institutes, and letters were sent expressing appreciation of the proposal. One of the public boards issued regulations for hotels and boarding-houses, and as it was believed few of the existing buildings could be reasonably altered to suit them, the Council forwarded recommendations to the Board which were favourably considered. The desire is expressed to consult with public bodies for the purpose of drafting conditions of competition for proposed works. A conference was held with the Builders' Association on the subject of trade discounts and commissions, when it was resolved "that we cannot interfere with the purchasing power of the contractor according to trade custom." Messrs. OAKDEN, D'EBRO and LITTLE have been appointed to represent the Institute before the Royal Commission on the University of Melbourne. The usual note of discord is suggested by the statement that the inauguration of the Australian Institute, which it was hoped would take place by January 1, 1903, at the latest, has been delayed by the undue period taken by the Institute of Architects of New South Wales to determine its attitude towards the constitution which all the other four Institutes have agreed to. A statement was circulated among the members of the Institute in New South Wales with the result that by a large majority it was decided to hold aloof from the proposed Australian Institute. The attitude of isolation thus assumed is to be regretted. As its decision is known, matters may soon move from the passive to the active condition in the other four State Institutes. The Melbourne people, who will test the importance of the Institute by its balance-sheet, may not be impressed. But it is well to know that the balance at the bankers, which at the end of 1901 was 126%, has increased to 185% owing to the large number of members who paid their arrears.

ON Saturday the French Minister of Commerce inaugurated the new homes at Versailles, which M. CHAUCHARD has erected. Having purchased the "Pavillon de Madame," with the beautiful grounds, he contemplated the conversion of the building into a gallery to which his splendid collection of pictures could be removed. Then he remembered the claims of his employees in the great warehouse of the Louvre and resolved to erect several dwellings for them. Two avenues have been laid out, and along the sides are about one hundred semi-detached *maisonnettes*. In each there are a salon, dining room, kitchen, three bedrooms, with offices, and a garden. Aged assistants whose salary never exceeded 5,000 francs a year are eligible for admission as occupants. Those who have had a higher salary will be granted sites, but must erect their homes out of their savings. In the arrangements M. CHAUCHARD has taken care to avoid any diminution of the self-respect of the assistants, and the experiment is one of the most interesting solutions of the housing problem.

WHILE large sums of money are being expended in the hope of educating certain classes of students in technical subjects, it should be remembered that many young men who possess ability are deprived of opportunities for attending classes. They can take consolation in what CARLYLE says about a library being the truest modern university, and his words are as applicable to technical science as to literature. But then it is necessary for library committees and librarians to recognise their new duties. It would be well if in other parts of England the example of Newcastle-on-Tyne were more often imitated.

The Public Libraries Commission have not only secured the best books of all kinds, but they enable the public to realise how extensive are the means for instruction by publishing catalogues at a cheap rate, which are better adapted than any with which we are acquainted for students' purposes. The latest, by Mr. BASIL ANDERTON, the librarian, deals with books on the useful arts. It includes such special subjects as, among others, engineering in all its departments, chemical technology, manufactures and building. It is evident that preference is given to the latest works in each section. The technical student desires to possess the knowledge which is required to-day, and historical inquiries have to be left to times of leisure. DEWEY'S system is adopted in the classification. Like the other catalogues of the Newcastle-on-Tyne Library, the utility of the volume is not confined to inhabitants of the northern city.

THE church of Saint Germain l'Auxerrois, which is opposite the Louvre, derives its chief attraction in the eyes of many English visitors from its connection with the slaughter of St. Bartholomew's Day. From the tower the signal was given for the attack on the Huguenots. The church has many interesting features. In the porch remains can be seen of frescoes which are commonly supposed to be Mediæval work. But they are of no older date than the reign of LOUIS PHILIPPE. They were executed by MOTTEZ, one of the pupils of INGRES. He employed a golden ground as well as very brilliant colours. His paintings were at first so remarkably brilliant it was considered necessary to paint the masonry near them in grey in order to diminish the violent contrast. But MOTTEZ' colours were not adapted to resist time. The question lately arose about the manner of dealing with them. The Municipal Council have the responsibility. Some members propose restoration, while others advocate the removal of the fragments. The cleaning to which they were subjected was entrusted to the Pompes Funèbres, and in that way the destruction was hastened. At present the frescoes are deceptions, for few people have realised they are little more than a half-century old. It would be well for the sake of truth in art to clear them away. Then, if painted work is necessary, let new frescoes be executed which will bear the mark of the century. For such an undertaking there is no more fitting artist than M. OLIVIER MÉRSON.

THE bequest of the late W. H. COPE to the Victoria and Albert Museum, South Kensington, has been arranged in the Cross Gallery adjoining the Indian Section, and forms a most valuable addition to the Oriental collections. Many of the specimens were acquired at the dispersal of the works of art of well-known collectors. Attention should be directed to the examples of carvings in jade, crystal and other stones from China and India, which fill the first case; amongst them may be noted a crystal bowl and a crystal teapot, enriched with stones in gold and flowers composed of rubies, emeralds and diamonds. On the top shelf in the same case are a pair of dark green jade candlesticks, carved with flowers. The mandarin's rosary suspended at one end is a beautiful work of art. The next case is devoted to a miscellaneous collection of lacquer work, Chinese enamels and Japanese netsukés. The third case contains a collection of glass, amongst them being some tall Venetian wine-glasses with remarkable stems, which Mr. COPE acquired at the Magniac sale. In this case likewise are some dark blue glass flagons with painted ornament, formerly in the Bernal collection. Specimens of Chinese porcelain fill the two remaining cases. There are examples of biscuit-body vases of the *famille verte*, and wine pots in the form of mythical lions; bottles and jars with blue and white decoration; vases with splashed glazes hitherto unrepresented in the Museum; a very rare powdered blue bottle in the form of a triple gourd, enriched with polychrome flowers in white panels, and a very considerable collection of egg-shell cups and saucers and plates of the Chien-lung period (1736-1795) delicately painted with flowers and figures.

THE BRADFORD CONFERENCE.

IT is a common weakness to praise the past rather than the present time, in the belief that men have become inferior to their predecessors. There may be some arts in which there has been a decline owing to the greater attention obtained by other classes of production. In sanitation, however, there can be no doubt of modern superiority. The descriptions of the condition of cities and towns in old days make us wonder not so much at the appalling plagues and death-rolls, but at the vitality which allowed any of the inhabitants to survive the visitations.

We can see from the statutes there was no enactment affecting sewers until the reign of HENRY VI., when commissions for the purpose were ordered to be appointed. But they were only temporary in duration and restricted in operation. HENRY VIII., from an Act passed in 1531 concerning the reparation of walls, streams, ditches, banks, calcies, bridges, trenches, &c., might be supposed to have resolved on sanitary as on religious reform; but when we find that all he was ambitious to perform was an extension of "the laws and customs of Rumney Marsh, in the county of Kent," to other parts of the kingdom, it is evident the improvement of the country, and not of towns, was aimed at. The state of London long afterwards is by itself enough to show the fear of kings and Parliament to interfere with the supineness of citizens in whatever concerned public health.

There are reformers who are still convinced, in spite of all the Acts treating of hygiene which have been adopted during the past sixty years, that there is a lack of power to combat the evils which exist. The desire for more restrictions was exhibited in many of the addresses at the Congress of the Sanitary Institute which was held last week at Bradford. The appointment of a Minister of Public Health was advocated as requisite. It was explained that the law is insufficient to deal with adequate force in nearly all classes of subjects which relate to sanitation. Bakehouses especially are believed to escape the control which is required owing to the duality of the authority which governs them, for it is partly local and partly general. Retail establishments can be supervised by the medical officer of the sanitary authority; wholesale bakeries come under the cognisance of the factory inspector. Another class of buildings which engaged attention at the Conference of Medical Officers of Health was nursing homes. The owners were invited to take the initiative in obtaining the legislative measures which are inevitable. In all new homes ample cubic space, the best sanitary arrangements, including heating and ventilation, are demanded. The need of disinfectants in such buildings and several others is sometimes urgent. But in spite of the wide control which now prevails over many things connected with illness, disinfectants are supposed to be such blessings they are exempted from officialism, and preparations are made and sold which "are not only worthless but actually dangerous." All that is necessary is that the bottles containing them should differ in shape from ordinary medicine bottles. One of the obstacles to a remedy is the difficulty of securing agreement among specialists about a bacteriological test, "for investigations have led to glaring discrepancies."

As a rule, the desire is to make regulations more stringent. But in one important division there was a suggestion that they might be relaxed. A by-law is generally adopted which prohibits the erection of a new building "upon any site which shall have been filled up with any material impregnated with any animal or vegetable matter, or upon which any such matter may have been deposited, unless and until such matter shall have been properly removed by excavation or otherwise from such site." The removal is not always possible, and is the land to remain unprofitable? The Cardiff Corporation have had the question investigated by their bacteriologists, Dr. W. G. SAVAGE and Mr. J. H. SUGDEN. After a long examination they have arrived at the following deduction:—"The refuse as deposited contains a very large number of organisms, many of which are in the main different from those met with in ordinary soil. These made-soil organisms, as they may be called for convenience of reference, rapidly diminish in number under the conditions under which they are placed. This diminution goes on for the first two or three years. After two or three years

however, the ordinary soil organisms begin to invade this material, and apparently thrive abundantly in the rich organic material available to them. This causes a marked increase in the total number of organisms present in the soil, and the total number remains large, until in quite old soils a diminution is again met with. These soils begin to lose their special bacterial content after two or three years, and from that time begin to take on the characters of ordinary soil." The result is one of the most satisfactory of the Congress, for although it may lead to a premature use of made soils, it will remove apprehensions by nervous people when they discover the nature of the ground on which their houses are raised. Evidently nature is not so inimical to man as other researches seemed to warrant.

The foregoing case may be taken as a warning against edicts which do not admit of exceptions. It is not, however, enough by itself to support the views of those who believe we have a sufficient number of laws relating to sanitation. To many it will be counterbalanced by the statement of Mr. W. H. MITCHELL, a manufacturer, who believes that "The Factory Acts have helped employers to success by compelling them, as a whole, to do what the most enlightened of them were always anxious to do—turn their attention from the old wasteful and ruinous methods of trying to obtain large production by long hours of work and economy by low wages, to the only way of obtaining these results satisfactorily, by means of improved machinery, better management and more efficient workers." He concluded by saying:—"Never was our production so large, never was the work we turn out so good as it is to-day. There are those who say that the best thing the State can do for the industries of a nation is to let them alone. The factory legislation of Great Britain is a standing proof of the fallacy of this position." Mr. MITCHELL's words sound like a knell of the *laissez-faire* policy. But from what is known of their working it is evident that the Factory Acts were drafted with the expectation of interfering as little as possible with the prejudices of people who are unlike Mr. MITCHELL, and in consequence there is an encouragement of patching and whitewashing as palliatives of evils which are only to be remedied by the reconstruction of many buildings.

The new arrangements by which the School Boards were superseded cannot be fairly judged without further experience of them. It is not to be anticipated that County Councils will regard expenditure with the blandness of their predecessors. To exercise authority to the extent of, say, a shilling in the pound, is very different to demanding payment of that shilling besides several more for other purposes, as has now to be done. There is consequently hesitation about laying out the money which is needful if schools are to be in a proper condition. On that account there was some misgiving expressed at Bradford as to the satisfactory state of school sanitation. More cubic space per child was said to be required, as well as an increase of heating power in order to insure more efficient ventilation. Lighting was alleged to be deficient, for the irreducible minimum should be 1 foot of glass for every 5 feet of floor-space. There are defects in the eyes of many children which no fenestration can alter, and Dr. ANDREW LITTLE asked why they were not remedied? His answer was:—"Simply because the educational authorities fail to vote the necessary amount of money to pay properly qualified ophthalmic surgeons to do the work, and through not doing so, force the children to submit to education which, instead of preparing them better for the position of trustees of the destinies of this great empire, leaves them ophthalmic cripples, a burden to the empire instead of a help, penny wise and pound foolish." It was not anticipated when the first Education Act was passed that expenses of that kind could arise, but with modern notions of public policy it is hard to see how they can be avoided.

We cannot expect from each of the Sanitary Congresses the announcement of one or more discoveries which seem to be destined to revolutionise the practice of those who endeavour to promote an increase of public health. Sanitation is one of those subjects in which progress has to be slow, and it may be only fractional. But from the large number of eager workers who are satisfied with being allowed to take a share in the work there is no doubt evils will be subdued as the years pass.

COUNTRY AND SUBURBAN HOUSES.*

ENGLISHMEN who have lived abroad or in the Colonies for several years, and who have to depend on ordinary journals for information concerning life in England, must often be puzzled about the character of modern buildings. At one time they will read condemnations of the showiness and the excess of manufactured ornament which has been introduced. But in a week or two they may come across philosophical reflections about the desire of Englishmen to go back to the simplicity adopted by their ancestors for their homes. There is so strong a belief that only one principle can prevail at a time, it is accepted with difficulty that the two classes of building can be in favour simultaneously. A large body of men who some forty or fifty years ago would think it necessary to inhabit a supposititious imitation of a Mediæval fortress or a still more strange compound of incongruities which was accepted as an improved Italian villa, now believe it is an essential for repose to live in a two-storeyed structure (with attics), for which the nearest prototype is an old-fashioned country cottage or an ancient secluded mansion. During the day the same man may be an occupant of a commercial establishment which has a great deal of vulgarity about it, while in the afternoon he returns to a quiet domicile and hopes visitors will think he is keeping up family traditions in the character of his country house. There is no doubt some incongruity exists between the two styles which can gratify an individual. But after all, inconsistency in the manner of judging structures is not a grievous fault.

Among the architects who have been successful in meeting the prevailing demand for one class of country-house is Mr. ERNEST NEWTON. He has now selected several examples from those he has erected in different parts of England, and has published them in a volume which can be made suggestive to other architects as well as instructive to people who contemplate building, but are without definite ideas about what they wish to achieve. Exterior views and plans are given in most cases. There must always be a limit to what an architect should offer, and Mr. NEWTON has presented only four interiors, one being a room which is enough to create a desire for more. The remarks which Mr. NEWTON offers on the subject of planning in his introduction form the explanatory key to the illustrations. He writes:—

The planning is without doubt the most important thing in the designing of a house. "To be happy at home is the ultimate result of all ambition." No one can be quite happy in an ill-planned house any more than in ill-fitting clothes, and although "the cut" and "style" are much, they count for nothing in a garment which pinches and annoys the wearer in a hundred ways. The most commonplace little wants in a house must be considered, and the planner must not have such a soaring soul that he is unable to bring himself to consider them. But although house-building is very much a practical art, the practical requirements may be met gracefully and pleasantly; there is scope for dignity, humour and even romance. The house-planner must, however, recognise his limitations; building is only plastic to a certain point, and we are much compelled by the natural use of materials; our choice is not restricted now as it was when transport was difficult and costly, but this is not an unmixed advantage, for while it widens our range it destroys "local colour," and the exigencies of the materials ready to hand, together with the ingenuity displayed in fitting them to their needs, developed many varieties in our house-building. It would be affectation to insist nowadays on the use of local materials only, but it is, I think, legitimate to take the district into consideration. Materials foreign to the countryside are often imported for no better reason than that the architect has a habit of design and an inelastic mind. We must, too, get rid of the idea that we can compel materials to assume any shape we like, in defiance of their idiosyncrasies. Our house-building ought to develop naturally. In the animal world abnormal variations are considered as apart from the general scheme of progress, and are popularly called "freaks," and the

conscious breaking away from normal lines of development so conspicuous in much of the building of the last few years, especially on the Continent, may perhaps be not unkindly called "Freak architecture." A natural architecture is a rational healthy builder's art expressing itself soberly through the medium of masonry and carpentry. This "New Art" was no doubt originally the outcome of a genuine if somewhat perfervid enthusiasm, and of a desire to shake off all unnecessary restrictions. But it has mistaken liberty for license, has abandoned all reserve, and threatens to retard, if not to destroy, the growth of a sane and reasonable architecture.

The character of the houses is to some extent dependent on the materials prevailing in the neighbourhood. Brick, hanging-tiles, rough-cast and rough local stone are exemplified. As a rule three plates are assigned to each subject, but in some cases the number is increased, and a house in Berkshire has five. Importance is attached to the plans, and they are shown on a scale which makes them easily understood by novices. All through there is a breadth of treatment and an absence of fussiness of which architects at least will approve. The book embodies the results of ability, experience and good sense, and should be a welcome addition to architectural libraries, for those who have adopted a similar style can appreciate Mr. NEWTON'S efforts.

Mr. C. R. SNELL claims that in his "Modern Suburban Homes," he has submitted eighteen distinctive designs, affording material for an infinite number of variations and combinations. They are derived, he tells us, from large and varied experience of his own and a critical inspection of the executed works of others. Evidently Mr. SNELL has practised in the Colonies, where more liberty can be exercised than is always possible in England. He admits a partiality for balconies, verandahs and porches, acquired "through a somewhat prolonged residence in a sub-tropical climate," and he is of opinion that even "in the more chilly climate of England they are not to be despised if employed in moderation, and especially where care is taken to avoid undue interference with the light into any of the rooms." The misfortune is that in this country, owing to the greed which turns every yard of land on a property into a building site, there is nothing to see from any of those points of view which can give much pleasure. In country towns we find small plots which could easily be converted into pleasing objects to the advantage of people near, devoted to buildings which, from the limitations of the site, have to be awkward in shape. As the suburban homes shown in the plates are not costly, the occupants would be unlikely to have any voice in the manner of laying out the building estate. The designs are for detached and semi-detached houses. They are unpretentious, and the author does not suppose they will be exactly followed. The windows are large, the rooms are well arranged, and Mr. SNELL believes they can be adapted to the requirements of occupants.

One of the differences between English and Continental Gothic churches is to be observed in the narrowness of English doorways as compared with the capaciousness of those abroad. It might easily be imagined that in the English buildings it was intended to suggest the difficulty of entrance into religious practices and to inculcate the necessity of humility by bending the body. But there is no such contrast in the mansions. It was long accepted in England that the doorway could be made an outer sign of hospitality and the welcome awaiting visitors. A narrow entrance looks ill, while a doubled doorway imparts dignity. Shrewd builders in some suburban terraces know this, and allow space to be sacrificed for the sake of the expression which can be derived from an opening that would serve for a small church or assembly-room. Several of the houses from which Mr. GALSORTHY DAVIE has taken his materials for "Old English Doorways" depend for their interest mainly on the character imparted to the entrance. The seventy plates include examples of the sixteenth, seventeenth and eighteenth centuries. They begin with one of those found in the majestic ruins of Cowdray, near Midhurst. It has a flat arch with sculpture above. Some were of larger span, and therefore more suggestive. Another early Sussex instance is from the Middle House, Mayfield, which is remarkable for the abundance of the mouldings. The Butchers' Guildhall,

* (1) *A Book of Country Houses*: Illustrated on sixty-two plates reproduced from photographs and drawings, accompanied by plans of each. By Ernest Newton. (2) *Modern Suburban Homes*: A series of eighteen distinctive designs for small and medium-sized houses. By C. R. Snell. (3) *Old English Doorways*: A series of historical examples from Tudor times to the end of the eighteenth century. By W. Galsworthy Davie and H. Tanner, jun. (London: B. T. Batsford.)

Hereford, suggests a transition from the Tudor arch to the lintel. In the Gatehouse, Kenilworth, we see Classic influence in the arches, niches and pilasters. More severity is displayed in the doorway of Sackville College. The example from the north wing of Cobham Hall shows how much was gained by treating the doorway as the lower storey of a lofty projecting structure in fine stone, while the rest of the building was in brickwork. There are other examples from the same building. The two doorways from Hatfield House suggest two degrees of importance, one for state occasions, one for ordinary use. The doorway from Abbot's Hospital, Guildford, from its width becomes an ecclesiastical institution. There are also a couple of fine examples from Aston Hall. The porch at Capmill, Painswick, is dated 1678. The gateway at Castle Ashby is one of the finest in England, although the niches are vacant. The doorway of St. Helen's Church, London, dated 1633, has nothing that is especially ecclesiastical, unless it be two feathered heads. There are several doorways from private houses and vicarages in various places. The columns may be elongated, and not minutely exact in the details. But they are evidence of a desire which could not be resisted. In Longbridge House, Farnham, the surface of the brickwork over the doorway has been cut away in order to allow of a curved outline in which two fleurs-de-lis are introduced. One of the doors from Queen Anne's Gate, Westminster, recalls houses which depend for much of their interest on the carving of the woodwork, which appears to be as sharp as when executed two centuries ago. There is so much resemblance among the eighteenth-century doorways, the details might have been supplied from a common centre. There are occasionally features introduced which recall monumental sculpture, as if both classes of works were derived from the same source. Mr. DAVIE'S photographs are taken with great skill. Although only fragments of buildings, they have sufficient completeness to satisfy us, and even when only a part of a doorway is shown we can realise that we have all that is of value. By restriction to one subject more or less monotony might be expected, but so much judgment has been exercised in the selection, no two doorways exactly correspond, and there is a variety which could not have been anticipated.

Mr. TANNER'S notes form a monograph on the subject, which is illustrated by sketches of his own, and which will be read with interest and profit. Doorways have been favourites of late years with sketchers. But the class is one which is almost inexhaustible, and happily there is a growing demand for new examples which will retain some of the characteristics of old English work.

ARCHITECTURE AND HYGIENE.

AT the Sanitary Congress a lecture was delivered in the Technical College, Bradford, by Mr. J. Slater, F.R.I.B.A., before a limited audience.

Mr. Slater said he should endeavour to bring before the Congress some of the points of contact between hygiene and architecture, taking each in its broadest aspects. About four-and-twenty years ago, in a paper read before the Royal Institute of British Architects, mention was made of an architect of some eminence at that time who had built a house for a client, and four months after its completion this architect was asked to come down and inspect the house because some of the drain-pipes were stopped and there were difficulties with the plumbing arrangements. The architect was most indignant, and simply told the client to send for his plumber. He doubted whether any architect, however much he might be imbued with an exalted idea of the high artistic nature of his profession, would now take up a similar attitude, as we have learnt to appreciate the fact that however beautiful may be a building, its main purpose is to be lived in or worked in, and that unless it is constructed with due regard to health, it will be but a whitened sepulchre. Hence the necessity for close supervision of all details of construction, however small or apparently unimportant. But there is a wider aspect of the question which has not often been dealt with, viz. how far the purely artistic side of architecture is concerned with hygiene. This consideration might possibly carry them rather far afield. It was impossible to believe that the ancient building nations—the Egyptians, the Assyrians, the Persians, the Cretans, the Greeks and the Romans—all of whom, in addition to erecting buildings which had been and still were the admiration of all

who saw their remains, held in the highest esteem physical health and physical development, could have been altogether neglectful of sanitation, though they were doubtless ignorant of the scientific principles on which it was based. In the Middle Ages sanitary arrangements were of the most primitive kind; but, at any rate, primitive as they were, the winds of heaven exercised their cleansing influence freely, and he firmly believed it would be difficult to find in any Mediæval city worse conditions than prevailed in many of the London theatres, as detailed in a paper read before the Institute some few years ago, or in bakehouses, factories and workshops all over the country. The fact is, people sometimes forgot how very modern sanitary science was. The insanitary survivals of old-fashioned methods of construction in this country were found more particularly in the smaller houses for the working and middle classes, with which the defects were to be associated. In a nobleman's mansion, where there is a large staff of servants, cleanliness is generally attended to, though even here the servants' quarters often leave much to be desired; but in smaller houses the one aim should be to construct them in such a way as to make the very minimum of attention necessary to keep the places clean, because they might be sure, in many cases, that minimum would never be exceeded and often not reached. The amount of money expended in England and in all the more civilised countries on the cure of disease is simply enormous. The greatest care possible was taken to insure cleanliness and to minimise opportunities for the propagation of microbes, and there could be no doubt that since the principles of sanitation had been known and carried out, the percentage of cures of all kinds of diseases had enormously increased. And yet, how much better was prevention than cure? Every year, in the outskirts of all our large towns, acres and acres of new sites were covered with houses for the lower classes, which, even when they were new, were scarcely sanitary, notwithstanding local by-laws, and undoubtedly, in a few months, became foci, if not of disease, yet of poor health, and the inmates of such houses became increasingly unfitted to struggle against disease. A great advance had been made in artisans' dwellings, which now had attention given to their construction, but as soon as one got just above the artisan class, the poor struggling clerk or the shopman and the small tradesman, one would find that the dwellings themselves were not one whit better than they were fifty years ago, and the surroundings of these dwellings were infinitely more confined than used to be the case. The methods of construction which were good and necessary in a hospital were equally good, and, to his mind, almost as necessary, in an ordinary dwelling-house, and they could be provided in the latter at a very small extra outlay beyond what was generally spent. The fact was that of late years the working man had monopolised the attention of the benevolent and the charitable. Mr. Slater said he should like to see some capitalist take up the cause of the lower middle classes and start a company for the erection of middle-class dwellings at reasonable rents, and as municipalities are going in for commercial speculation, they might find this not one of the least profitable. The Artisans', Labourers' and General Dwellings Company, which has gone on these lines, has always managed to pay a dividend. Local by-laws had done much to rectify flagrant abuses, but one could not frame by-laws to meet all small details. The fact was, we wanted fewer hard and fast lines laid down, and literal specification of requirements in our Building Acts and by-laws, but more discretion left in the hands of those who had to carry out these legislative enactments. This opened up one of the most important questions relative to the health of the people; he meant the standing and qualifications of inspectors and other officials, who had practically the whole matter in their hands. What did we see all over the country? A local builder, who had failed in business, got some kind friends to propose him as building inspector, or perhaps even surveyor, to the local council. Were he as honest and painstaking as possible, how could such a man enforce to the full regulations which he had been for years trying to evade as far as he could, and of the necessity for which he is probably very doubtful? He would inevitably incline to leniency, which would soon become laxity. In his opinion, the appointment of every health officer in the country, and the amount of his salary, should be subject to the approval of the Local Government Board, and then they might make the Acts themselves which have to be carried out much more elastic. The lecturer having given a description of the manner in which attractive-looking suburban houses, letting at from 20*l.* to 30*l.* per annum, were sometimes built, said that in many of these, as soon as cases of infectious disease had been nursed in them contamination commenced, and in a few years, it was his firm belief, such houses became what in a hospital ward would be termed permanently septic, and it was almost impossible to get them sweet. In the past dozen years or more much that he had said had been urged at hygiene congresses and sanitary institute meetings all over Europe, and yet so little had been

done; and why? Expense was generally considered the great obstacle, but he could not help feeling that there was a greater one, which was this: the people who built the houses were so rarely those who dwelt in them, and there was so little fixity of tenure. The lecturer said he was no Socialist, but he could not shut his eyes to the fact that the improvement of the dwellings of the people was a question which was intimately bound up with that of the ownership of the land on which they are erected, and until we can get rid of the middle-man in the shape of the speculative builder, who only cares to put up his buildings at the lowest possible cost, we shall never improve the separate small dwellings of the people. How this speculative builder can be abolished is a question of political economy which scarcely comes within the scope of this paper, but when we see what is being propounded in Ireland as a cure for all the ills from which the peasantry of that country are suffering we get a hint of a possible solution. He saw no reason why the lower middle classes of this country should not be trusted to fulfil their obligations as well as those in the Sister Isle, and he would not be surprised if in the next generation the Government were to take up the question of loans to small householders for the purpose of helping them to buy their own freehold sites and build their own houses, and if this were done we should soon see a vast improvement in the construction of the people's homes. Discussing the question, How far is the health of a people affected by the artistic or æsthetic side of architecture, by matters which are not constructional, but are connected with site, arrangement of plan, surroundings, style and design? the lecturer said that it was the opinion of an eminent oculist that a great deal of the defective eyesight which was annually becoming more and more prevalent in towns was due to the fact that these urban dwellers looked so seldom on the pleasant restful green of the woods and fields and so constantly on dull bricks and mortar, and if this opinion were well founded it might undoubtedly make us give more consideration to the prominent tints which we use for both the insides and outsides of our dwellings. Just as light caused us to feel cheerful and warmth made us feel comfortable, so he believed it would be found that colour in soft graduated tones had an immense effect on our well-being. Staring, garish, inharmonious tints must have a somewhat similar effect through the eye on the brain as loud, cacophonous sounds have through the ear. Mr. Slater urged that wall-paper should be selected with due regard to the aspect of the room, and he particularly insisted on the value of sunshine. He would be sorry to see huge blocks of artisans' dwellings multiplied in the heart of our great cities. The object should be to get the workers away from their work when it is finished by increasing the facilities for quick and cheap transit. With the startling development of electric traction, he did not think the time was far distant when it would be the exception and not the rule for the workers to live in close proximity to their work, when this was performed in crowded areas. Concluding, the lecturer said it was impossible to over-estimate the good which had been done in the last thirty years by the Sanitary Institute, by its examinations, its publications, and not least by its congresses, but there must be no cessation of activity. An excellent foundation had been laid, but the superstructure had yet to be erected. It could not too often be dinned into the ears of the governing bodies that upon the health of the people depended the wealth and well-being of the nation.

ARCHITECTS' FEES.

AT the Lincoln Assizes an action was heard in which Messrs. W. Watkins & Sons, Lincoln, claimed payment from Curtis & Mawer for professional services as architects. Mr. Stanger stated, says the *Lincolnshire Mercury*, that the defendants had premises in Silver Street, opposite Messrs. Watkins's offices, and in 1898 they decided to make considerable alterations. The first idea was they should rebuild, and they naturally went to Messrs. Watkins and employed them as architects. Some three or four months afterwards preliminary plans were sent, and then Messrs. Curtis & Mawer changed their intention, and decided instead of rebuilding to have extensive alterations made. Further plans were prepared, and eventually, instead of a plain scheme, an elaborate scheme was adopted. During 1899 some conversation took place as to the scale of remuneration, and Messrs. Mawer asked if Messrs. Watkins would undertake the work of architects at 3 per cent. on the lowest tender. Of course, Messrs. Watkins could not entertain that. The usual sum payable on contracts over 1,000*l.*, and this was something like 6,000*l.*, was 5 per cent., which included the preparation of the plans and the superintendence of the work. Three per cent. was altogether too low, but the plaintiffs considered the matter, and having regard to the fact that the premises were just opposite Messrs. Watkins's offices, and the building, according to the plans then prepared, was to be plain and almost of the warehouse type, they agreed

to accept 4 per cent. No reference was then made to any expenses outside the ordinary professional charges, nor was any reference made to taking out the quantities. In course of time the defendants instructed the plaintiffs to invite tenders, and the lowest was received from the defendants' cousins, Messrs. Mawer Bros., of Louth. Four tenders varied between 7,500*l.*, 7,600*l.* and thereabouts, but Messrs. Mawer's came to 6,756*l.* After a time the defendants changed their intentions and ceased to employ Messrs. Watkins, not because of any fault—that would not be suggested for a moment—but because they thought they could dispense with the services of an architect. The ordinary charge for taking out quantities was 1½ per cent. or 2½ per cent., and if the plaintiffs had continued as the architects they would have been entitled to 4 per cent. on the lowest tender and 1½ per cent. or 2½ per cent., but when their employment by Messrs. Curtis & Mawer ceased, they charged 2½ per cent. for their plans and 1½ per cent.—the lowest charge—for getting out the quantities. There were a few extras (7*l.* for interviewing other architects, &c., with reference to adjoining ancient lights, and 12*l.* for lithographing the quantities), and that brought the total to 289*l.* 11*s.* 9*d.* This was sent in in November 1900, and it was not until then that the plaintiffs learned the defendants contended there was a special bargain for 4 per cent., including everything, if the work proceeded, and 2 per cent. if not. It was preposterous, however, to think the plaintiffs would ever consent to such an arrangement. They were not young architects anxious for employment, but were well established, having been in the city forty years; further than that, nothing was said about the charge in the event of the abandonment of the work, for such a contingency was never dreamt of.

Mr. W. Watkins, J.P., gave evidence to that effect, and in cross-examination said he could not state that anything was specifically mentioned about the extra charges for getting out quantities, but Messrs. Curtis & Mawer thoroughly understood there would be that charge.—Mr. Young: You were the architect for the late additions to the County Hospital at Lincoln?—Witness: Yes.—And your commission was 5 per cent.?—Yes.—Did you get anything in addition for taking out the quantities?—Yes, 2½ per cent.—In addition to the 5?—Yes, certainly, on the buildings alone, but not on the engineering work. There was about 2,000*l.* worth of building work, and I got 2½ per cent. on that in addition to the 5 per cent.—There was a great discussion on the cost of the works, was there not?—Yes, one gentleman wanted to know what I was being paid.—Did you then say your charge was 5 per cent. on the cost of the work and money out of pocket?—Yes; and let me add that the gentleman who raised the question asked me the direct question whether “I got anything for quantities,” and I said “Yes.”—Mr. Young: I don't see that in the paper, but if you say so I accept it.—Mr. W. G. Watkins gave evidence as to the arrangement, and Mr. D. Matthews (London) and Mr. Bromley (Nottingham) spoke as to the practice of the Institute of British Architects. The usual charge for taking out quantities was 2 to 2½ per cent.

Mr. Young, in defence, argued that the question for the jury was not how much Messrs. Watkins were entitled to charge had there not been a special bargain, but what they actually agreed to charge. He acknowledged quantities had to be taken out, and that that was necessary work, but the plaintiffs knew that work was necessary, and if they said in their capacity of architects they would do all there was to do for 4 per cent. on the lowest tender, he submitted they were not entitled to charge more. Messrs. Mawer went to them and said, “We want to know exactly what you are going to charge,” and if in answer to a question like that they said “4 per cent.” it was not fair for them to turn round afterwards and say there was another 2 per cent. behind it.—Mr. Fred Mawer said it was distinctly arranged 4 per cent. should include everything, and that if the tenders proved prohibitive and the work was not carried out the charge should be 2 per cent. The witness was cross-examined at some length respecting various conversations, and as he kept looking at his cuff Mr. Stanger eventually asked what he had got upon his sleeve.—Witness: Some notes.—The Judge: You ought to know better. You didn't take those notes at the time of the conversation I suppose, and therefore you have no right to refer to them.—Mr. Stanger: Have you a diary?—Witness: No.—Mr. Stanger: Then from where did you get your notes?—The Judge: Up your sleeve, I suppose.—Mr. Hy. Albert Mawer (Wragby) said he went with his brothers and asked what would be the cost, and Mr. Watkins said, “The usual charges.” He pressed to know what those were, and Mr. Watkins said 4 per cent. In reply to other questions he said he should charge 2 per cent. if the work was not carried out.—Mr. Young: Did you know anything about the charges for taking quantities?—Witness: I did not know then what quantities meant.—But you knew the difference between 4 per cent. and 6½ per cent.?—Yes.—Mr. Stanger: You have nothing up your sleeve?—Witness: No.—Did you ever think of the work not being carried out?—Yes.—Why? Because the plans kept getting more elaborate.—But Mr. Watkins fol-

lowed your instructions, didn't he?—No, we had to follow him.—If the plans were getting more elaborate than you wished why did you not complain?—We daren't, I suppose.—You dare ask him, however, to reduce his charge by one-half, but daren't tell him to make plainer plans.—Well, we didn't.—Mr. J. G. Mawer, auctioneer, Wragby, also spoke as to the conversation at the interview, and Mr. Alfred Puckeridge (another partner) said he was told afterwards the result of the conversation. He did not think, however, any definite arrangement was made; there was simply conversation as to what the charge would be.

Mr. Stanger, in addressing the jury, said Messrs. Watkins had given their evidence in a manner which better recommended it to the jury's acceptance than that of the Mawers, and that theirs was infinitely the more probable story of the two.

The Judge pointed out circumstances which seemed to favour the plaintiffs, and the jury found for Messrs. Watkins for the amount claimed. Judgment was entered accordingly.

LIBELLING THE CITY SURVEYOR OF MANCHESTER.

AT the Manchester Assizes on Monday, before Mr. Justice Bigham, Edward Birks, aged 54, a surveyor, formerly in the city surveyor's department of the Manchester Corporation, surrendered to his bail on a charge of maliciously publishing a defamatory libel on Mr. T. de Courcy Meade, the Manchester city surveyor. The prosecution was conducted by Mr. H. G. Shee, K.C., with whom were Mr. Overend Evans and Mr. F. Brocklehurst. Mr. M'Keever, Mr. Wingate Saul and Mr. Sandbach appeared for the defence. The alleged libel was contained in a printed document drawn up by Birks and sent to various people in an unsealed envelope. Amongst other passages from this read by Mr. Shee the following, says the *Manchester Guardian*, were relied upon to establish the case for the prosecution:—"I am prompted by no feelings of animus towards the city surveyor, my great anxiety being to clear my name from the foul stain upon it, and at the same time to try and compel the city surveyor if possible to speak the truth." Referring to a difference in some estimates for work done, and in which an outside surveyor differed from Mr. Birks, he wrote, "It was a deliberate trap laid for me by the city surveyor, and I refused to fall into it." In other passages it was said:—"Thomas de Courcy Meade, upon his appointment as city surveyor, may have suffered great anxiety as to how to perform his important duties. He determined to sweep clean the department of all officials of known ability by any means, fair or foul, he cared not; and, with few exceptions, he has been allowed to do so. . . . The baths committee have also paid hundreds of pounds in arbitration and surveyors' fees—utterly wasted, and the amount ought also to be charged to the city surveyor, occasioned by his unscrupulous scheming to injure myself and deprive me of my position. . . . If the city surveyor can produce the nine final measure bills and certificates . . . I am guilty; if he cannot—and I say he cannot, for seven out of the nine do not exist, or ever have, except in the malicious mind of the city surveyor—then I say this man ought to be criminally prosecuted by the Corporation for knowingly and wilfully deceiving the committee."

Of the libellous character of the statements, Mr. Shee said, there could not be the slightest doubt. It appeared that some time ago, when Birks was in the employment of the Corporation, Mr. Meade had told him that he was not strong enough to deal with the contractors, and after several difficulties had occurred Birks was given three months notice. This appeared to have soured his mind, and he had taken the action complained of.

Mr. Shee was proceeding to comment upon the libels in detail when the Judge asked: Why go into all these? They are distinctly libellous. The question is, Can they be justified?

Mr. Shee concluded his address with the remark that his client could not overlook the matter, as it undermined his authority in the office, but the last thing in his mind was to persecute Birks.

Mr. Meade then went into the witness-box, and the Judge asked why.

Mr. Evans: So that he may be cross-examined.

For two hours Mr. Meade was under cross-examination by Mr. M'Keever. He said that he had had to complain of acts of insubordination on the part of Birks when Birks was employed under him, as, for instance, his taking accounts before the committee without his (Mr. Meade's) knowledge. He had never suggested that Birks was corrupt either in his quantities or prices. The fault he alleged all through was that Birks was too weak to deal with the contractors.

After further cross-examination, the Judge said to Mr. M'Keever: I regard this, and I do not mind telling you, as a

great waste of time. We have had a great deal of it—over two hours, and it is a great waste of time.

A little later the Judge asked: How long are you going to be?

Mr. M'Keever: A considerable time.

The Judge: Half an hour, or two or three days?

Mr. M'Keever: An hour or two.

The Judge: What, with this witness?—Yes.

"Then, gentlemen," said the Judge, "we will adjourn for luncheon."

On the reassembling of the Court after luncheon Mr. M'Keever said that he had given due consideration to certain remarks which had fallen from the Judge, and having regard to the difficulty, if not the impossibility, of justifying the allegations that had been made, he had advised his client to alter his plea to one of "Guilty." Birks's only intention in writing the letter was to get a hearing by the committee with regard to the grievances under which he felt that he was labouring. He now left the matter in his lordship's hands.

Mr. Shee said that Mr. Meade had no animosity whatever against the defendant, and he had never, at any time, alleged that Mr. Birks had been guilty of any corrupt practice or intention. All he had done was to express the opinion that Birks was not strong enough for the position he occupied. There was a passage in the report of one of the inquiries in which Birks said he did not think that Mr. Meade was desirous of getting rid of him. He wished to add that this matter had been ventilated in the City Council, which had decided that the city surveyor was entitled to a continuance of the confidence and esteem of the council. Provided that the Judge could secure that there should be no repetition of these libels, Mr. Meade would be perfectly satisfied. As to whether that course would meet the ends of justice, that was a question entirely for the Judge.

The Judge said he thought the defendant had been very well advised to alter his plea to one of guilty. For his part he had heard nothing in the course of a long cross-examination to give any ground for the serious reflections which had been made upon Mr. Meade in the libel. Whether a prolongation of the inquiry would have elicited anything further he did not know, but he suspected that if two hours had failed to elicit anything of a material character, another full day's inquiry would probably have had the same ineffectual result. He could not see that anything Mr. Meade had done furnished cause for saying that he had done more than his plain duty to and for the benefit of the Corporation. He had no doubt that the defendant thought—mistakenly—that Mr. Meade had acted unfairly towards him in some way, and it was perhaps desirable that the defendant's counsel should have had an opportunity of cross-examining Mr. Meade. He hoped by this time that the defendant was satisfied that Mr. Meade was actuated by no motive other than that of duty. He need say no more about it, except to order the defendant to enter into his own recognisances in 50*l.* to come up for judgment when called upon. If he repeated these libels in any way at all he might be quite certain that he would be so called upon.

ONSLOW FORD MEMORIAL.

ON Monday Sir L. Alma-Tadema, R.A., unveiled a memorial to the late Onslow Ford, R.A., which has been erected in St. John's Wood, at the junction of Abbey Road and Grove End Road, within a few minutes' walk of the sculptor's studio. It is in the form of an obelisk; on one side it is adorned with a replica of the Muse at the base of the Shelley memorial at Oxford, and on the other by a medallion portrait of Mr. Onslow Ford. The whole is protected with railings and lamp-posts. The inscription on the memorial is as follows:—"To Edward Onslow Ford, R.A., erected by his friends and admirers." As chairman of the committee Sir L. Alma-Tadema, before unveiling the monument, said that Onslow Ford's work was so remarkable, his nature so lovable both as a man and as an artist, and he was so dear to them, that it became their wish to erect a small monument to his memory near the place where he had lived, loved and worked. The borough of Marylebone had in every way facilitated their task, and they thankfully accepted that as a sympathetic proof of the esteem in which their friend was held. Appreciation of Onslow Ford's work was lacking neither in this country nor in France, where he was corresponding member of the Institute. English art lost in him a sculptor second to none, and the Royal Academy schools a great teacher. His career was cut short in his prime; he might be said to have died in harness, for he felt ill after addressing the students at South Kensington, at a time when he was still putting the final touches to his beautiful *Snowdrift*, and his illness lasted but three days. Familiar to all was the long list of his splendid portraits, from the statue of Sir Henry Irving in the Guildhall Museum to the bust of Paderewski exhibited

at the Royal Academy last year. The delightful youthfulness of his *Peace*, the grace and refinement of countless exquisite figures must recur to them as their memory made silent review of his achievements. They would remember also the many works with which he enriched England, India, Khartoum. It was from, perhaps, the noblest of these, the monument of Shelley now at Oxford, that they had chosen the sorrowing Muse to adorn that memorial; not merely as a reminder to all who passed Onslow Ford's beautiful work, but because nothing could be better placed there than that symbol of a silent and noble grief. They would not cease to mourn him, nor to feel the void of his absence; but their pride and delight in his memory would also know no end. Therefore they were glad to have succeeded in raising that small token of a great regret, and they had chosen that spot for their memorial, not merely because St. John's Wood was the place where Onslow Ford was most beloved and lamented, but because they wished to accentuate the fact that St. John's Wood was a centre of art, and that they believed that healthy and beautiful neighbourhood, so dear to them through countless memories, deserved to be esteemed, embellished and protected rather than to be singled out for wanton and wasteful destruction. They were particularly indebted to Mr. John Simpson for designing the memorial and superintending its erection; to Mr. Lucchesi, who so kindly claimed the right to execute the medallion portrait of his master; and to the borough for having laid the necessary foundations.

The Mayor of Marylebone accepted the memorial on behalf of the borough.

ANCIENT EARTHWORKS.

A PROVISIONAL scheme for a systematic record of ancient defensive earthworks and fortified enclosures in this country has been prepared by the committee appointed at the Congress of the Archaeological Societies on July 10, 1901. The committee suggest that secretaries of the various archaeological societies, and other gentlemen likely to be interested in the subject, should be pressed to prepare schedules of the works in their respective districts, in the hope that lists may eventually be published. The list should be confined to defensive works, omitting burial barrows and boundary banks. Though record should be made of any "finds" indicative of period of use of the forts, no effort need be made to assign a definite period of construction, excepting in those cases in which the age is beyond question—e.g. camps and fortified settlements of undoubted Roman origin, or enclosures of proved Neolithic, Bronze or Iron Age. The committee now consists of the following members:—Professor Boyd Dawkins and Professor B. C. A. Windle, Mr. W. J. Andrew, Mr. A. R. Goddard, Mr. I. Chalkley Gould, Mr. W. H. St. John Hope, Mr. J. Horace Round and Mr. W. M. Tapp. It is hoped that other gentlemen willing to work towards the object in view will join the committee. The committee ventures to hope that the issue of the provisional scheme will enlist the earnest co-operation of archaeologists and observers in all parts of the country, and thus serve towards the preservation from mutilation or destruction all these priceless relics which no laws protect.

It is proposed that defensive works be classified, so far as may be, under the following heads:—(a) Fortresses partly inaccessible by reason of precipices, cliffs or water, additionally defended by artificial banks or walls; (b) fortresses on hill-tops with artificial defences following the natural line of the hill, or, though usually on high ground, less dependent on natural slopes for protection; (c) rectangular or other simple enclosures, including forts and towns of the Romano-British period; (d) forts consisting only of a mound with encircling ditch or fosse; (e) fortified natural mounds, or artificial mounds, with traces of an attached court or bailey, or of two or more such courts; (f) homestead moats, such as abound in some lowland districts, consisting of simple enclosures formed into artificial islands by water moats; (g) works which fall under none of these headings.

In every case in which masonry is used for defence, whether wholly or in part, the fact should be mentioned. The existence of mounds or tumuli within defensive enclosures should be noted. When a fortress is provided with more than one rampart or wall the fact should be recorded, as also when the enclosed area is divided by transverse banks. It is specially desired that the position of each work be indicated by noting the number of the sheet of the O. S. (6-inch scale) in which it appears and by giving the name of the nearest town or village. Plans traced from the 25-inch O. S. maps should, if possible, be sent. Ramparts and ditches should be clearly indicated, as well as the O. S. levels, and accurate sections will be of great service. Although plans and sections will be welcomed it is to be borne in mind that the main object of the committee is to obtain lists of defensive earthworks and enclosures throughout the kingdom. Though not strictly within the scope of this

inquiry, it is suggested that all Mediæval castles should be included in the schedules, since many of them originated in earthworks of Class E. Assistance will be duly recorded in the report which the committee hopes to present to a future congress of archaeological societies.

BRICKLAYING IN WINTER.

IN his report upon the trade and commerce of Stockholm during 1902, Mr. Stewart MacGregor, the British Consul, remarks that in winter time one hears much about the want of employment for bricklayers and others in the United Kingdom on account of frosty weather. Yet anyone residing in Stockholm during the winter months can see bricklaying carried on in hard frost as an everyday occurrence. This, from a British point of view, is so unusual and important that he has obtained particulars as to how it is done. He includes in his report, therefore, a description of Mr. P. Graham, a fellow-countryman long resident in Sweden, of the system adopted, adding that the art of building stands very high in Stockholm, much of the work done being both ornamental and of excellent quality. It is explained that a few years ago a series of experiments was carried out, the results of which proved that, without any special precaution as to material or labour, bricklaying can be carried on in Stockholm at a temperature as low as 14 deg. Fahr. For lower temperatures it is necessary to heat the sand and water used in making the mortar, and for this purpose very simple apparatuses are employed. The mortar should be made in a room where the temperature is kept well above freezing. This temperature should naturally be regulated according to the frost that has to be counteracted. Generally the builders here make a room of this kind by roughly boarding in a part of the scaffolding, simplicity and cheapness being the prominent characteristics of all the arrangements. When building in frosty weather the following precautions should be observed:—(1) In laying the bricks care should be taken to avoid shifting them after they have once been set in the mortar. (2) Never use old or stale mortar, but arrange supply to correspond with demand. (3) It should be understood that the brick used here is of a light or porous character, which readily absorbs the moisture from the mortar. Hard-pressed or calcined bricks and stonework generally are not suitable for building during frosty weather, but edgings or ornaments, &c., of such material can easily be dealt with by slightly warming them before bringing them into position. (4) Although brick building can thus be carried on safely under any of the temperatures already named, this does not apply to plaster or cementwork, which should not be done at or below freezing point unless proper heating arrangements are made. Whereas in Stockholm fifteen or twenty years ago almost all building was broken off during four to five months every winter, it is now the exception that such operations are hindered by frost more than a few days or a few weeks annually, and this though there is much more stone and ornamental work in the buildings now being erected than in those of an earlier period. What twenty years ago was considered practically impossible has now become everyday practice.

GREEK HOUSES.

WHEN there is scarcely a vestige of many of the temples, stadia, theatres and odea which once adorned the country of Greece—and, perhaps, equalled in design the Parthenon, Erechtheion and Apollo Epicurius—no very extensive remains could reasonably be expected of the elegant villas and other buildings of less durable construction; but the desire arising upon this subject, so valuable and interesting, is gratified with an ample knowledge of the designs of Grecian villas by the fortunate discovery of several bas-reliefs which exhibit in a beautiful manner this style of building, and by the pleasing description of palaces and villas given in the earliest authors. The villas and minor buildings of the Athenians no doubt partook of the same purity of style and elegance in design with their public edifices; for the same feeling for honour and reputation which animated Ictinus to the accomplishment of his distinguished designs of the Parthenon at Athens and Apollo Epicurius at Phigalia, would also direct him and other eminent architects in buildings of less magnitude and costliness, though of equal importance to their fame in architecture. The ambition of display of decorations in the private dwellings of the Athenians even excited the wit of Aristophanes, who says, "Your houses shall be as temples, the roofs shall be triangular and represent a spread eagle."

The Colchester Town Council have resolved to accept the tender of an American firm to lay the rails for the Colchester electric tramways for 35,035/.

NOTES AND COMMENTS.

It may be remembered that the most serious accident which arose in connection with the Paris International Exhibition was caused by the fall of a "passerelle," or foot-bridge, leading to a supplementary show in which the celestial globe was presented on a large scale. Litigation followed, and it was with difficulty the various degrees of responsibility were determined. With all its power, the city of Paris has not been able to escape liability. A civil action was commenced by five children, whose parents were killed, against the city as well as against the contractors. After deliberation the judges have decided it was the duty of the civic authorities to withhold the concession until a detailed plan of the structure, with the calculations of strength, had been submitted and tested. The works were allowed to be commenced and carried on without any official superintendence, and no steps were taken to insure public safety. The first care of the authorities was therefore neglected. The city was accordingly condemned to pay an indemnity of 2,500 francs to each of the five children. The contractors will have to give 600 francs a year to the two youngest until they have attained their majority. The catastrophe was the more remarkable as the municipality of Paris has at command a large body of experts, but, as elsewhere, they are occupied with alleged defects which are without the least danger to the public.

THE Wiltshire County Council having declined to commence a law-suit against the owner of Stonehenge for interfering with the public access to the great stones, the Commons and Footpaths Preservation Society have decided to take up the case. It is considered that a sum of 2,000*l.* will be necessary to meet the expenses, and about one-half the amount has been guaranteed. It is recognised that the owner is desirous to preserve the monument and that the money obtained for entrance within the barbed-wire fence is partly applied to pay the wages of a guardian. It would have been easy to have the monument preserved at the cost of the country if Stonehenge were allowed to be recognised as an ancient monument—an arrangement which was proposed when the Ancient Monuments Act came into operation. The Society now appeal for guarantees or donations for the amount of 1,000*l.*, and then it will be possible to test the public right of access to the monument in the law courts. It is well to have the rights of private owners recognised, but it is astounding that in order to vindicate those rights so venerable a monument should be treated as a place of exhibition, like one of the natural or artificial grottoes found in so many holiday resorts. Sir EDMUND ANTROBUS is willing to sell the stones and eight acres of land for 50,000*l.*

THE "Manual of Library Economy," by Mr. J. D. BROWN, of Finsbury (SCOTT, GREENWOOD & Co.), treats of whatever relates to the founding, arranging and working of a public library. It is needless to say that in so comprehensive a work, in which American as well as English practice is described, there is much that will be found useful by architects. Mr. BROWN's theory is that buildings should bear some proportion to the funds available for maintenance. He works out one of the results in this way:—"A library with an income of 1,000*l.* may spend 250*l.* a year in annual repayments of the principal and interest of loans. For this it can borrow something over 4,000*l.* Allowing 1*s.* per cubic foot as the cost of building, and 10 per cent. (or 400*l.*) for the cost of furniture, we get 72,000 cubic feet of contents, which is equal to a space 96 feet by 50 feet by 15 feet, or, leaving out the height of the rooms (15 feet), is equal to an area of 4,800 square feet. On a site this size it is possible to erect a building of one storey, possessing the great advantage of having every department on one floor, which will accommodate about 34,000 volumes, 140 newspapers, magazines, &c., and about 200 readers and borrowers at one time." Mr. BROWN considers that utility is often sacrificed to exterior appearance, and, in consequence, the fittings have to be of the cheapest kind. Another point to be considered is

whether the outlay on bookshelves, screens, &c., is to be regarded as furniture, or as fixtures forming permanent parts of the building. Open competitions for plans are recommended, but before issuing the instructions a properly qualified officer should be called in as adviser. The author is disposed to limit the number of works which can be considered as having enduring interest. Where the income is 500*l.* provision for 20,000 volumes is sufficient, and when from 1,000*l.* to 2,000*l.*, 40,000 volumes. The author is no faddist, and the experience he has derived from his official position as a librarian in London is cheerfully imparted, and the book can be recommended for clearness and fulness of information.

ILLUSTRATIONS.

CATHEDRAL SERIES: EXETER.—THE CHOIR SCREEN.

LAST week we published a view of the choir of Exeter Cathedral in which the Bishop's throne appeared, a work which used to be ascribed to Bishop BOTHE, but which is now considered to date from the episcopacy of Bishop STAPLEDON (1308-26). The screen we illustrate in this number is also to be credited to him. In the Fabric Rolls of 1318-19 and subsequent years there are various entries of columns, marble and iron for "la pulpytte," which some have asserted was intended for sermons delivered outside the building. There can be little doubt "la pulpytte" was the screen at the west end of the choir. According to the late MACKENZIE WALCOTT, the form of the old rood-screen in France and Belgium was altered to serve instead of ambones for the use of the epistoler and gospeller, and for reading of pastorals. The bishop gave his benedictions from the loft. The "rood" or large crucifix is supposed to have been placed on an iron bar above the screen. Archdeacon FREEMAN explains the use of the word "pulpytte" instead of screen in the records by saying:—"It is manifestly, from first to last, a French idea, newly imported from France, and carried out in the main by French workmen. It is always 'la pulpytte,' the vaulting under it is 'voutura,' not 'voltura,' and when a statuary is sent for 'from London,' to make some additional statues 'by the desire of the Treasurer' (who had perhaps quarrelled with the Frenchmen—certainly there is no record of his giving them anything *ex curialitate*) special mention is made of the fact as something extraordinary." The side openings served as chapels. In one was an altar dedicated to the Blessed VIRGIN, in the other an altar of St. NICHOLAS. The openings to the choir are modern, for the back walls were covered with tracery. The panels above are filled with oil-paintings. JOHN BRITTON stated the subjects were "Adam and Eve in Paradise," "The Deluge," "The Destruction of Pharaoh," "Devastation of Solomon's Temple," "The Angel Appearing to Zacharias," "The Nativity," "The Baptism of Christ," "The Taking down from the Cross," "The Resurrection," "The Descent of the Holy Ghost." The organ was originally built by JOHN LOOSEMORE, of Exeter, in 1664-65, but has been subjected to several changes.

UNIVERSITY COLLEGE HOSPITAL.

HOUSE AT ROEHAMPTON, SURREY.

THIS house has lately been completed, and stands in the Nepean Road, Roehampton, on the Spencer Lodge estate. The walls are finished in white rough-cast, and the roofs covered with red sand-faced tiles. The whole of the details are kept very simple throughout. The house contains a large hall and staircase, drawing and dining-rooms, and all other offices, with six bedrooms. Mr. E. D. HOBBS, of Thames Ditton, Surrey, is the builder.

ST. MICHAEL'S COLLEGE, TENBURY.

By J. S. BUMPUS.

(Continued from last week.)

THE whole of the north transept is used as a baptistery. The font, on a cross-shaped platform, is of Caen stone, with green panels of Egyptian marble. It has a lofty spiral canopy of oak 22 feet high, richly carved, which is raised by means of a windlass. An arched recess contains a stone desk for the registry, and a special well in the north-east corner supplies water for the font and also for cleaning the church. The whole appointments of the baptistery, with its raised font and aspiring cover, as also those of the altar, with its striking canopy, testify to that prominence which the Church assigns to her two Sacraments.

An eagle lectern of brass is placed outside the screen. The litany desk, or faldstool, of a graceful design in carved oak, stands *in medio chori*. It was the gift of the late Mr. A. Trevor Crispin, of the Treasury, one of Ouseley's lifelong friends. Mr. Crispin was also the donor of some handsomely bound books for use at the altar, and of a large, rough calf-bound Book of Common Prayer for the organist. To Mr. Crispin Ouseley dedicated his set of six anthems, composed at Rome in 1851, and published in his collected cathedral music in 1853.*

The pulpit, of Caen stone, octangular, with figures of angels at the corners, stands at the north-east angle of the nave. It was the gift of Captain E. J. Otley (d. 1871), an able amateur musician, 'cellist and composer, and another of Ouseley's most intimate friends.

Mural crosses of brass are fixed in the walls near the pulpit and lectern, to the memory of Sir F. Ouseley and the Hon. Miss Georgina Rushout. They form prominent features in the view from the west door.

* Mr. Crispin published in 1873 (Macmillan & Co.) "A Christmas Carol"—a small folio containing a series of illuminations illustrative of scenes in connection with the Nativity. Some of these illuminations were original, while others were drawn from ancient missals and service-books, mainly in the possession of Captain Otley.

The nave consists of three full-sized bays and a smaller westernmost one. A low stone *septum*, running from north to south, fences off this small bay, which is left unbenched. The piers, whose capitals are carved in natural leafage, are of blue stone from the Forest of Dean. The clerestory windows are of two and three lights each, cinquefoiled, and the aisle windows of four lights, trefoiled. The western windows of the aisles and two in the porch are square headed. In the south clerestory a beginning of stained glass has been made. A small door facing the porch opens into the quadrangle. The nave is seated partly with movable benches and partly with chairs. Gas not having yet been introduced within the precincts of the college, the lighting of the church is effected by hanging oil lamps of polished brass.

The south transept is filled with the organ, an instrument of great sweetness and power. It is so raised above the *decani* stalls that the pedals are on a level with the stallbacks. The front pipes are all polychromed, and painted with figures and mottos relative to the dedication of the church. In Ouseley's later years certain of these front pipes, instead of projecting in their original fan-like Spanish form, were placed upright, as we now see them. There were good reasons, no doubt, for the change, but not a little has, perhaps, been lost to the eye in artistic effect. The organ which was in the church at the consecration in 1856* was built by Flight, of St. Martin's Lane, London, after a design furnished by Sir Frederick Ouseley. It had four manuals and a pedal organ, forty-eight stops and seven couplers. This instrument, after having been in use only eleven years, was succeeded by another and larger organ of sixty-five stops, by Harrison, of Rochdale, opened on December 8, 1868. Sir F. Ouseley's fine eight-part anthem, "Great is the Lord," was composed for and sung on the occasion. This instrument also proving unsatisfactory, the present magnificent one, which still contains much of Flight's work, was erected by "Father" Willis, and

* It was only half-completed by the opening day, but Dr. (afterwards Sir) George Elvey, who played on the occasion, is said to have "done wonders" with it.

ST. MICHAEL'S COLLEGE, TENBURY. INTERIOR OF THE CHURCH, LOOKING EAST.

finished in 1874. It has been improved since then, and now possesses four manuals, sixty-four stops (including twelve on the pedal organ), nine couplers, viz. three to swell, four to great and two to pedal. It has pneumatic action, and the pedals are concave and radiating. A remarkable feature about this organ is that it contains the largest bellows, used for light pressure only, ever made by Willis. Organ-building on the scale of Ouseley's tastes must have been very expensive work, but with his devotion to high aims he grudged nothing in the cause of sacred music. The present organist, Mr. Edgar C. Broadhurst, is a perfect master of his instrument.

The visitor for the first time is recommended to enter the church by the north porch. The *coup d'œil*, as seen from that point, is very striking. Perhaps the effect from the corresponding corner at the south-west is even more so, for here one is much astonished at the air of height which the architect has contrived to give his building. The north transept with its clerestory of lancets, seen athwart the pillars and arches of the nave, is almost cathedralic in appearance. On a bright, sunny day the effect is further enhanced by the stone, which has preserved all its original freshness, undimmed by smoke and dirt, and by the brilliant tints of the stained glass. The choir screen, the pendant brazen lamps, the diapered organ pipes, the polychromed reredos, the needlework on the altar and faldstool and the tiled pavement are all important factors of colour in this truly fascinating interior.

One should not fail to notice the pretty peep of the meadows on the opposite side of the road, as seen from the church, when the door of the north porch is open, especially on a fine morning.

The material used in the construction of the church and college is sandstone, dug upon the site, grained and chased with Bath stone. The roofs are composed of Delabole slate, and a blue stone from the Forest of Dean was selected for the several columns and shafts.

As may be seen from the photograph, the college buildings form a most pleasing group, especially when viewed from the south-east corner of the grounds. The south façade is quite an object-lesson in fenestration. Altogether, one sees in the simple forms of the building the assurance that practical sense not less than uncurbed taste for the picturesque presides over the conception, and that while the beautiful never faded from Woodyer's eyes, he was incapable of sacrificing internal comfort to the seductive picturesqueness of a broken outline.

Twice daily in term time, at 9 A.M. and 6 P.M., matins and evensong, with the accompaniment of the choicest music, are as reverently and punctiliously performed in this remote spot as they would be in the midst of a crowded city. On Saints' days the morning service is at 11 A.M. On all such days, and on certain Sundays, matins are followed by a choral celebration of the Holy Communion. The selection of music is large and representative, and comprises the finest specimens of the English School of cathedral music from the period of Tallis to the present day.

It seems to be thought by many that St. Michael's is merely a musical school. No supposition could be more erroneous. Certainly, it was Ouseley's primary desire to train up boys for Holy Orders by a sound public school preparatory education, and who would add to this course such a knowledge of Church music as would extend the use of the choral service on intelligent lines, and improve the tone of Church music throughout the land. Stress, however, must be laid on the fact that many boys, on leaving the school at the breaking of their voices, gain scholarships at the great public schools, and that they have proceeded thence to the Universities and are now filling responsible positions not only in the Church but also in the army, the navy, and many other departments of life.

The daily musical routine comprises an hour and a half in church and an hour's vocal practice in the hall with the warden and choirmaster, the Rev. John Hampton. There is a rehearsal with the full choir in the same place every Wednesday evening.

There is schoolwork each weekday morning from 7 to 8 and from 10 to 12; in the afternoon from 4 to 5.30; and again, in the evening from 7.45 to 8.45. Saints' days are half holidays from schoolwork. Boys who are taking lessons on the organ and pianoforte attend the organist after morning school at 12. So from this time table it will be clearly seen that musical work does not preponderate, and that in the

course of training music is a prominent but by no means an indispensable feature. Examinations are held at Christmas. In school work the Rev. Vincent Cooper, M.A., precentor of Durham and late scholar of B.N.C., Oxford, is the examiner; that in music being Dr. George Robertson Sinclair, organist of Hereford Cathedral.

The boys have excellent cricket and football fields, a fives court, playground, gymnasium and a good school library. Recently, under the régime of the present head-master, the Rev. W. A. Renwick, a carpenter's shop has been started, and has proved a great source of interest. There is adequate accommodation for bathing in a large pool, formed out of Cadmore Brook—a narrow stream dividing the county of Hereford from that of Worcester, just below the cricket field. Attached to the college is a foundation for eight choristers, to which boys are admitted only as vacancies occur after having served as probationers. The choristers receive their board and education gratuitously. Probationers are elected after a competitive trial of voice and ear—a preference being given (*ceteris paribus*) to the sons of clergymen. They receive their education at an almost nominal cost. A certain number of commoners, or boarders, are admitted on much higher terms. All boys wear the academical cap and scholar's gown in hall and the surplice in church. The last named, however, is only worn by the commoners on "surplice days," i.e. Saturday evenings, Sundays, Saints' days and eves of Saints' days.

The adult portion of the choir is composed of the warden, the head-master, the second master and four professional lay clerks resident in the neighbourhood. The educational staff of the school consists of the head and second masters, both in holy orders; the organist, for instrumental music, and masters for French and writing. The vocal training of the boys is in the hands of the warden. To his long experience and careful tuition is due the admirable and natural way in which the boys produce their voices and pronounce their words. Their uniform excellence of conduct and sobriety of demeanour in church are very noticeable. The adult members of the choir (clerical and lay) sing with thoroughly artistic feeling, and with that hearty love for their noble art which alone makes it possible to produce such music adequately.

The Visitor of the college is the Bishop of Hereford, and there are twenty honorary Fellows, non-resident. These include several names of eminence.

The late Rev. Francis Tebbs Havergal, prebendary of Hereford and vicar of Upton Bishop, gives in a letter written to Miss Hackett,* from St. Michael's, May 20, 1873, a pleasant glimpse of the college:—

"I am spending a day or two at this delightful place of Sir Frederick Ouseley's. Doubtless you know all about his sixteen choristers. It is a goodly sight to see them when at meals in the hall—but to hear them sing, I know nothing like it; so refined are their voices that I never hear the like elsewhere. They are very carefully trained and taught, and their behaviour is remarkably good also. Sir Frederick sends his best compliments, and desires me to inquire whether you have seen his 'Essay on Cathedral Choristers,' in the volume published last year by Dean Howson, wherein he acknowledges, with the deepest obligation, the great and valuable interest that for so many years you have taken in the choristers of England."

The Dedication and Commemoration services are held annually at Michaelmas, and now, as in years past, there is always an array of old friends and former pupils, clerical as well as musical, all bent upon enjoying the occasion, while doing honour to the college and its founder.† This, as

* This amiable and patriotic lady spent the whole of her long life (she died in November 1874 at the age of ninety-one) in inquiring into the education and generally ameliorating the condition of cathedral choir boys all over England. Once in every three years she paid a visit for this purpose to each cathedral. For over seventy years she constantly attended the services at St. Paul's Cathedral, the chorister of which were the first, in 1811, to engage her attention.

† The Rev. Dr. J. B. Dykes, of Durham, who is known far and wide as the composer of some of our finest hymn tunes and other Church music, noted in his diary the great enjoyment he had at one of these Michaelmas gatherings—that of 1867. He was one of the selected preachers, another being the Bishop of Oxford—Samuel Wilberforce. Dykes's impressions will be found in his "Life," edited by the Rev. J. T. Fowler, hon. canon of Durham (John Murray 1897).

recent writer has truly observed, will convey some notion of the attraction which the *genius loci* has for its former members and those who have been in any way connected with it, and those who know the high character and excellent tone which characterise the school, the exceeding beauty of the surroundings, and the bracing healthiness of the situation, will heartily join in the wish that it may long flourish and prosper.

(To be concluded.)

A HOSPITAL WARD.*

THERE are several instances known in new wards constructed upon the latest principles of failures which have been absent from the older and entirely out-of-date buildings, and the reasons have been—in the cases with which I am personally acquainted—not far to seek. The old wards were known to be dangerously unclean, and special precautions were therefore taken to counteract this condition. The new wards were so very bright and clean that anything but perfunctory cleaning was scarcely thought necessary. In the old wards the windows were kept open, and the very walls, innocent of plaster, were porous enough to be an assistance to ventilation. In the new, it appeared that the provision of air inlets in the walls was thought to obviate the necessity of opening the windows.

Another example of this neglect of well-worn principles occurs to me, although it is not directly connected with a hospital ward. The drainage of a certain building was relaid upon modern principles with manholes at every branch and change of direction. The old drains were always well-flushed periodically, and thus kept fairly clean. The new drains were supposed to act for ever without such assistance. Five years after they were laid, when superintending some repairs, &c., at the building, I made a general examination of the system, and was compelled to use a crowbar to open up the covers of the manholes, which had never been touched since the drains were first laid. The building owner in this case had not realised that manholes were merely constructed for more easy access to and inspection of the new drains than was possible with the old.

One other example—and this was in connection with a ward. The whole of the inlet ventilators were expensively constructed with pipes glazed internally. On revisiting the hospital a year later I found these flues black with dirt. They were never cleaned.

Are not we who build hospitals apt at times to forget the principles upon which we design certain details? It is an accepted principle, for instance, that all angles, internal or external, should be well rounded, yet not many years ago I remember an architect drawing the attention of a class of students to the hollowed skirting between the walls and floors of his wards; then proceeding to point out an arrangement he had devised for preventing the beds being pushed against the walls. This consisted of a square fillet nailed to the floor within half an inch of the skirting—i.e. he had carefully done away with one internal angle to the floor and added two.

I have heard, too, of air inlets constructed as I have described above, and closed at one end with a fixed grating, which effectually prevented any cleaning.

After all, the great principles to be kept in view in the details of a hospital ward are few and simple, and one of them—not the least important—is the avoidance of all sharp internal angles, deep-cut mouldings, and other not easily cleaned lodgements for dust and dirt, those harbours of disease germs and a source of pollution to the air of the ward. It will be sufficient, in so short a paper as this, to deal mainly with this principle.

Floors.

It may be taken for granted that whatever difference of opinion there may be with respect to the walls, we shall all be agreed that the floor of a ward should be laid on a solid foundation, and that the surface should be as impervious as it is possible to make it. Also that it should be smooth and free from holes or crevices likely to retain dirt or dust. For this reason no one thinks nowadays of using plain jointed soft wood floors, because in addition to being absorbent the material is bound to shrink, and thus leave any number of crevices for the secretion of dirt and dust. Floor sweepings well wetted and impregnated with soap make a horrible compound.

Modern floors are of several kinds, which vary according to the fancy of the particular architect or the managers of the building. They comprise the following, viz. hardwood block floors, hardwood tongued boards laid in narrow widths, secret

nailed and polished; asphalte, terrazzo, patent composition floors such as Eubœolith, &c.

The hardwood floors are most frequently made of oak or teak. Hitherto I have myself adopted kiln-dried maple in very narrow widths. In addition to being an exceedingly hard and unwearable floor, its light colour shows up dust much more easily than dark woods, and this, to my mind, is an important detail. It would seem to be very desirable that dirt should always proclaim itself, but those who are immediately responsible for the cleanliness of the floors are, it is to be feared, not always of that opinion.

The most usual finishing to wood floors is beeswax and turpentine highly polished. I believe that if this is regularly wiped over with a wet rag and as regularly polished, it is a very good surface; though no doubt it is desirable to have the surface entirely cleaned off and renewed at intervals.

Terrazzo floors are much advocated on account of their supposed impermeability. I do not think them quite so impermeable as they are supposed to be. After all, the main part of the material is cement, and it is well known that both cement and marble chips are fairly absorbent materials. Indeed, the comparative impermeability of this floor is due to the high polish it receives when first laid, and that is very soon worn off. Perhaps these floors are best treated by being polished with beeswax as for wood floors. Even so, they are very hard to the feet, and the mottled colour too easily conceals dirt.

Asphalte is, no doubt, the most impervious of floor materials, but it is of a dark, uneven and bad colour, and is therefore seldom used.

My experience of patent composition floors has not hitherto been so fortunate as to enable me to commend them highly. They have some undoubted virtues, however, and the material is more impervious and less subject to the action of acids than any I know. Unless very carefully laid, they appear to be liable to swell and crack. The material can be coloured, and when polished the surface is excellent.

Skirtings.

The skirting, if it can be so called, to the floors should be rounded so as to form a good hollow. The most usual radius is from 2½ inches to 3 inches. Latterly I have used 1½ inch only, which is quite sufficient for its purpose, and can be carried round projections more easily than is possible with the larger radius. All that appears to be necessary is to have such an angle as will permit of the whole surface being easily and rapidly cleaned and prevent stagnation of air. It is best formed of the same material as the floor. I have, however, seen hollowed glazed bricks used, but there are too many joints, and the edges of the bricks are not generally even.

Wall Surfaces.

There are practically two opposite principles which govern the material of which the wall surfaces should be composed, and these are derived from views on that much-vexed subject—ventilation. It would be rather trenching upon this subject, which is large enough for separate treatment, to attempt to discuss whether the walls should be porous or not.

It is safe, however, to assert that at the present time, for hospital ward walls, at least, impervious walls are mostly in vogue. If we adopt this principle, the next most important consideration is that the surface of the internal faces should be easily cleaned and kept clear and free from dust. In some modern treatment of walls we have, I think, somewhat overlooked this principle, although on the surface it appears to have been carefully studied. I refer to the growing practice of lining the ward walls with tiles. The use of tiles has no doubt given us a more impervious and even surface over a large area, but it is discounted by the numerous joints which no care nor skill in the fixing can make smooth, except in a limited way. The ideal surface would no doubt be an unbroken and polished surface such as obtains on tiles, affording no ledges for the lodgment of dust; but this has been fairly well achieved by the use of enamel paint upon hard trowelled cement surfaces.

It is scarcely possible to obtain a more generally smooth surface than with trowelled cement—Keene's or sirapite, for instance. These can be brought to a polished surface. It is difficult, if not impossible, however, to obtain a really even colour. Although enamel paint can be used with decorative effect, pictures would still be required to decorate the walls, and the ordinary framed picture is a veritable dust trap. Therein tiled surfaces have the advantage of painted walls, as they can be decorated with permanent pictures painted on the surface. It would be, of course, too costly to renew pictures every time the ward walls required to be repainted.

It would be possible to cover permanent wall-paintings with glass let in flush with the wall surface, and I am not sure that this has not been done.

Ceilings.

There can be no question that ceilings should be non-porous, and they are best painted.

* A paper read by Mr. A. Saxon Snell, F.R.I.B.A., in the Section of Engineering and Architecture at the Congress of the Sanitary Institute, Bradford.

Windows.

As to the best form of window for a hospital ward, there appears no general agreement. The most usual is the ordinary sash window with a hopper above opening into the ward, with spandrel sides to prevent down-draught. It would appear, however, that its forms and construction involve the many angles, crevices and hidden voids which in other parts of the ward we strive so much to avoid. Casement windows with solid frames are at least not open to this objection, though no doubt their advantages in other directions may be questioned.

At Willesden parish infirmary I have used casement windows brought down to within 12 inches of the floor, and with hopper next the ceiling. The casements open inwards, and thus form a protection for the bed. It is possible also by opening the windows to their fullest extent to fairly flood the wards with air.

At Charing Cross Hospital, I am adopting a form somewhat similar to what I believe is known as the "Middlesex" window, owing to the alleged fact that it was first used at that hospital. There are five sashes of equal size in the height of the window, all of which (excepting the lowest) are hung on centres and controlled by one rod and lever. The sashes close one upon another, and there are therefore no transoms. The lowest sash is separately hung on the bottom rail. It is obvious that a window so constructed can be opened to a much larger extent than is possible with the ordinary sash window. I should add that all except the controlling lever of the opening apparatus is fixed on the outside of the window.

If it is possible to fix the glass of the sashes quite flush with the inner surface of the sashes, a great advance will be made.

Doors.

Nothing much can be said with respect to doors in a ward. They should be made wide enough to allow of the passage of a bed. It is desirable that the upper panels should be glazed with clear glass, and that because of a principle to which I shall refer later on.

The whole question of the material for joinery might be considered here. Hardwood throughout is generally adopted, where the question of cost is not vital—hardwood oiled or French polished. Its comparative freedom from material shrinkage, and its harder or less absorbent surface, are great advantages; but here again I think that enamel paint is not much, if at all, inferior.

I am hoping in time to obtain what I may call solid joinery, *i.e.* built up without panels with the inevitable sharp internal angles which can only be kept clean at the cost of great labour. Of course, it is possible to have solid or flush panels, but shrinkage soon shows up the joints, which then become dust-traps impossible to clean.

There are some Canadian doors now made of which the principle of construction could, no doubt, be applied so as to successfully overcome this difficulty. They are made up of quite small sections of wood very closely fitted together, and sheathed with hardwood beautifully dovetailed on, and the whole is pressed and almost welded together by hydraulic pressure. At present they are made to imitate the ordinary panelled door, but one is being made for me now—as an experiment—of solid soft wood, sheathed all round in oak.

Furniture.

It is in the furniture and fittings of wards, for which the architects are responsible, that there is a general falling away from the principles of construction we are considering; although I am bound to add that some very notable improvements have been made in late years in the construction of chairs, tables and bedside lockers. The last-mentioned especially call for consideration if only because they are less under observation and control than the furniture which stands out in the open. The tops are now usually of glass or marmorite, and if it were only possible to get rid of the closed cupboards it would not be difficult to design them generally so that every part could be readily and easily cleaned.

The mention of cupboards reminds me that these fittings are generally objectionable and should be as far as possible banished from the ward. One at least is, of course, necessary for holding surgical and medical appliances, lint, medicines, &c., but this should not, as is frequently the case, be placed or built against the wall. It should stand out in the centre of the ward, and should be constructed of hardwood, framed and glazed all round and on top and fitted with glass shelves. I am not certain that such a fitting commends itself to all nurses. Some time since a nurse complained to me that it cost her much labour and trouble to put away anything in these fittings, because, in effect, anything in the nature of disorder, or want of absolute cleanliness, could not be concealed even from her own sense of order—not to speak of the doctor on his rounds. I am sure that you will agree with me that therein lies its great virtue.

Fixed or heavy tables and chairs are to be avoided. It is quite possible to make a light table rigid.

Stoves.

I collect every reference in the building press to hospitals, new and old, and a great number of the smaller paragraphs are, I find, inserted by makers of particular ward stoves which have been used in the building. There is no reason to doubt that they are excellent stoves for many purposes, but as they are built of iron plates and grilles, and plentifully adorned with mouldings, &c., they would appear to be entirely unsuitable to a hospital ward.

One or other of the forms of stoves which is built up with plain firebrick and bricks or tiles is far preferable. There is a greater amount of heat given out by radiation and far less by conduction, and there are few lodgments for dust and dirt. Some of these brick and tile stoves are honeycombed with ventilating flues for heating air, which is conveyed by long horizontal flues from the outside. They would not appear to be open to objection, as they are so constructed as to be easily kept clean.

Heating and Ventilation.

It is not the purpose of this paper to deal with such large and controversial subjects as heating and ventilation, or to enter into any discussion upon the relative merits of natural or mechanical ventilation.

It is only necessary to remind you that whatever pipes or fittings are used, they should be so placed and constructed as to be easily kept clean. If possible, too, all controlling valves and pipes are to be kept out of the ward.

Flues of any sort, whether in the floors or walls, should also be so constructed, with movable gratings and covers, so as to allow of easy access for cleaning and disinfection.

Lavatory Basins.

Until quite recently a fixed lavatory basin was, I think, regarded as quite inadmissible in the ward itself, but the inconvenience of hand basins and the great improvement in the construction of fixed lavatories have combined to overcome the objection to their being in the ward. Of course, they are only for the use of the medical staff and the surgeons. The first hospital in which I saw them was one which is not even yet finished, and which has claims to being considered of the most modern design and construction. The basin was, however, of quite an ordinary pattern, and fixed close against the wall, but I regret to add that underneath the supply, waste, overflow and anti-siphon pipes—all on the surface of the wall—reminded one of Medusa's head.

While dealing with these fittings I should like to refer to the deceptive character of so many sinks and basins in the market, which are designed especially for hospital purposes. They are beautifully designed to avoid anything in the nature of dirt crevices or mouldings on the surface, and so far only as they can be obvious to the casual observer. But the glazed surface and rounded angles are confined to the top and sides. Underneath they are rough, angular and full of pockets which are never likely to be cleaned from the day they are fixed. Much improvement is being effected by a few manufacturers to meet the persistent demands of those who value cleanness and virtue in the unseen parts as in those seen.

One other detail I have to refer to, and that is the necessity of what I may call "openness" in every part of a ward and its adjuncts. It would seem desirable that in a general way both patients and nurses should always be under observation, or at least liable to be observed at nearly all times by the superior officers. If that appears to be objectionably stringent, I may add that it is not at all necessarily so.

I need scarcely say that I exclude the bath-rooms and ward conveniences, but certainly the duty-room and ward kitchen and separate day-rooms should always be more or less open. My own practice is to make the side next the corridor leading to the ward of glazed partitioning.

When patients know that they cannot escape even casual observation, they are more likely to behave themselves correctly, and the nurses themselves do their duty none the worse for the lack of opportunities of concealment.

It is better, too, that nurses should always be employed when on duty for shorter hours, than that the weariness of long hours should lead them to lounge or neglect their duties when occasion offers.

At the Mart, Tokenhouse Yard, last week, Messrs. Farebrother, Ellis & Co. offered at auction the freehold properties 194, 195 and 196 Strand, occupied by the *Daily Graphic* and others, and owned by the proprietors of the *Graphic*. The site has an area of 4,040 feet. Bidding started at 40,000*l.*, and at 63,000*l.* it was knocked down.

THE HOUSING PROBLEM.*

IT would be not only tedious but impossible to traverse in a short address like the present the many subjects where the sanitarian and the engineer meet on common ground, but at the present time there is one very prominent in the minds of men occupying responsible positions in our large centres of population; that is, the problem of providing suitable dwellings at a reasonable rental for those now lodged in unhealthy tenements with sordid surroundings.

The Legislature has decided, and very reasonably, that it will not grant compulsory powers for the acquisition and demolition of any considerable number of houses occupied by working men, and those dependent upon them, until provision is made for rehousing them at a reasonable distance from their work. Where the demolition of the old houses would be the result of a street widening or of making a new street through a congested neighbourhood, the cost of making provision for the evicted inhabitants can be fairly well ascertained beforehand, and is so much added to the cost of improvement; the authority can go to work with open eyes, having made up its mind that the improvement will be for the general good and worth the outlay. In such cases the Local Government Board exact all that they are entitled to, and make no exception for even another Government department, as a Bill promoted by the Postmaster-General for the acquisition of a site was withdrawn in consequence of the Local Government Board's representations, and the difficulties and expense of complying with the latter's requirements.

The Torrens Act, Lord Cross's Act, the Act of 1882 and others were consolidated in the Housing of the Working Classes Act of 1890, to enable the local authority to deal with large and small unhealthy areas by clearing them of houses unfit for habitation, and constructing in their place dwellings complying with sanitary laws. As one of the causes rendering the clearing of the site desirable would be its congested state, it would rarely happen that the new buildings, having a greater superficial room area per person, separated by wide streets instead of the former courts and alleys, could accommodate all the persons formerly living on the area; and the Act of 1890 gives the local authority power to acquire land elsewhere and make provision thereon for the persons unhoused. It may be assumed that the clearing away of unhealthy slums, with their hotbeds of disease, is a public benefit, and that therefore the cost of providing dwellings for those persons who have been unhoused is a legitimate charge on the public funds. An improved state of health must result in an improved condition of the mind, a sense of greater satisfaction with things in general and better ability to perform work. Unfortunately experience shows that only a small proportion of the unhoused population of an unhealthy area find a habitation in the new dwellings. Persons who have sunk to the level of squalid, dirty, overcrowded rooms do not readily appreciate light and airy dwellings with the restrictions enforced by the municipal control, and are gradually absorbed in houses of the type they have been accustomed to, which in their turn become overcrowded, while the new dwellings built with the rates are occupied by a better class of persons than those for whom they were intended. Custom also largely influences the choice of a habitation, and the wife of a working man does not take readily to a type of dwelling different to those occupied by her associates.

In many large towns there are, independent of the local authority, self-constituted committees for the better housing of the working classes who exercise sometimes an intelligent and sometimes a sentimental interest in their protégés. These bodies press the local authorities to put their powers in force even when it can be readily shown that the construction of working-men's dwellings in that particular district must entail a charge on the rates. In many places rows of houses have been built by the local authorities when the local builders were quite willing and able to supply all the accommodation necessary, and it is a doubtful point whether under those circumstances the council is justified in using the rates to compete with private enterprise, as there are very few instances where buildings constructed by or for the council have been built as cheaply as those put up by local builders. The Local Government Board very rightly insists that the by-laws shall be complied with, but it also places upon the council the duty of providing expensive means of drainage and greater floor space per head of the persons to be accommodated than the occupiers have been accustomed to. Again, a block of buildings built by a contractor working under such a specification as the borough engineer must of necessity prepare, and under proper supervision in order that the specification may be carried out, will always cost considerably more than similar houses built by the speculative builder working at his own time and in his own way. Of course I do

not refer to what are termed "jerry-built" houses, but to those constructed of sound, useful materials; yet it is no unusual complaint made by members of a council that a house built by a private individual, and providing all the accommodation found in one of those erected at the cost of the public funds, can be purchased at a much lower rate than the cost of the latter. For these reasons very few of the municipal schemes can show a clean balance sheet at the end of the year, even when the houses have been recently built, and if that is the case when they are new the result may be financially serious when considerable repairs have become necessary.

During the last few years the rates of most towns have shown a tendency to increase as better provision is demanded by the public for its comfort, convenience and amusements as well as for the necessities of life. Municipal debts have increased by leaps and bounds, and it is our duty that as tenants for life we do not leave to our successors a burden of mortgages too heavy to bear.

I take it therefore to be the duty of the municipal engineer, while desirous that his council shall occupy a foremost place in the advancement of all those points which make for the well-being of the people, to use his influence to discourage chimerical schemes for the lifting of a stratum of society that, do what you will to buoy them up, will always sink to the bottom and leave the advantages offered to them to be reaped by other strata capable of looking after themselves.

THE STORY OF TRENT BRIDGE.

IT should be remembered that in early times, says the *Nottinghamshire Guardian*, the great bridges of the country were not, as nowadays, maintained by local authorities. The expense was too great, and they were always treated as an Imperial burden, borne by the old kings primarily, assisted by the contributions of the charitable. King Edward the Elder built the first bridge over the Trent at Nottingham in the year 921, and in later centuries we read of the Archbishops of York granting indulgences to all such as contributed to its support. But in those times stonework was an unattainable luxury, and timberwork was made to serve in its stead. Hence, no doubt, reparations and rebuildings frequently took place. Not before the year 1300 was a stone Trent Bridge seriously planned, and it was the lady philanthropist of Nottingham—already known as a benefactor of the local White Friary and other charities—who projected and carried out the undertaking.

The story opens with an application by John le Palmer, of Nottingham, and Alice, his wife, for a Royal license to give 6*l.* 13*s.* 5*d.* of yearly rents of Nottingham property for the maintenance of two chaplains, to celebrate Divine service for their souls in the chapel of St. Mary on "Hethbeth Bridge," as it was then called. In accordance with custom an inquiry was held, in the Royal interest, in 1301-02, when it was reported that the proceeding would not be prejudicial to the king, and the desired license was consequently granted on April 16, 1303. In the last-named document it is recorded that the chaplains were to pray not only for the souls of the Palmers and their relatives, but also for the souls of "all Christians who assign their goods, or part of them, to the maintenance of the said bridge." Probably the Palmers were also then assisting in maintaining the structure, although we are not expressly told so. But the chapel of St. Mary—if it ever existed—is heard of no more. The benefactors built or rebuilt it as the chapel of St. James, and, being reared as part of the new bridge, it was not completed and fit for use until 1322.

Of course, the Palmers were people of position. John was made Mayor of Nottingham in 1302, 1306 and 1311. His wife, who survived him, was sister and heir to Hugh de Stapleford, of a powerful local family. Possibly it was her money alone that went to found the chantry, as her husband does not again figure in association with the work of the bridge. Probably Alice laboured at first in connection with the town authorities. At any rate, on August 28, 1311, there was issued a Royal grant to Alice le Palmer and the good men of the town of Nottingham of "pontage" for a term of five years, for the repair of the bridge of Hethbeth—under due supervision. This pontage, as its name implies, was a fund devoted to bridgework, derived from toll on goods entering the town, from whatever direction. Although "repairs" only are alluded to, there is no doubt that the bridge was being reconstructed, the terms being elsewhere confused among contemporary documents. Alice did not remain on cordial terms with the town authorities, for subsequently the latter desired that the same tolls might be diverted to the building of the town wall, as we shall see.

John le Palmer appears to have died soon after completing his term of office as mayor in 1312. On August 26, 1314, was issued a Royal "protection or license to beg for one year to Alice, late the wife of John le Palmer, of Nottingham, who is build-

* From the address by Mr. T. H. Yabbicom as president of the Conference of Engineers and Surveyors to County and other Sanitary authorities, delivered at Bradford.

ing the bridge of Hethbeth." No doubt the lady's object in obtaining the license was that of invoking the assistance of the charitably disposed about the country, through the medium of bearers of begging letters.

All this time, of course, the local pontage dues were being levied. On January 1, 1315, a case came up at the borough court, when complaint was made against one William Metel, for arresting two cartloads of wood at Chapel Bar, the west entrance to the town, for pontage. Defendant pleaded that he suspected them to contain merchandise.

On the expiration of the previous license, on August 30, 1315, there was issued another "simple protection for two years for Alice, late the wife of John le Palmer, of Nottingham, building the bridge of Hethbeth." Moreover, on the same date she obtained an extension for three years of the pontage grant in 1311 for five years.

So far as appears on the surface it must be confessed that the foregoing documents allude only to Alice le Palmer superintending the expenditure of funds contributed by others. But the building of the bridge was her lifework, and we are fortunately able to show that she expended her wealth as well as her energies thereon, insomuch that she began to feel anxious as to her old age. Hence she took steps, the result of which remains on record in the following interesting note, dated February 1, 1317:—"The king to the prior and convent of Thurgarton. Request that they will grant to Alice le Palmer, of Nottingham, by their letters patent, a suitable allowance for her maintenance in food and drink, to be received from their house for life, the king wishing to provide her with maintenance lest she should be brought to want on account of the expenditure of her goods about the construction of the bridge of Nottingham, upon which she has spent and still spends great sums for the common utility of all persons passing over the same, the king wishing that she may be animated to complete so desirable a work when she sees that she is sure of suitable maintenance for life."

In thus quartering the distinguished lady philanthropist on Thurgarton Priory, Edward II. exercised a privilege the Crown appears to have claimed of providing for old servants at the expense of the monastic establishments. In the present case it was evidently an "out-pension," for Alice le Palmer remained busy on the bridge many years longer.

When the same king granted an extension of "murage," or the right to take toll for the purpose of building the town wall, to the people of Nottingham on July 2, 1321, he inserted a stipulation that "custom is not to be taken of goods or merchandise whereof any custom is due in aid of the repair and amendment of the bridge of Hethbeth, and of another bridge between it and the land towards Gamston to be newly constructed, according to the king's grant to Alice le Palmer." Is it not possible in face of the preceding that the lady immortalised in "Lady Bay" is none other than this eminent bridge-builder?

About six months later, on January 12, 1322, the king granted murage to the town of Nottingham for three years, with a clause that the customs granted to Alice le Palmer, "in aid of the construction of certain bridges near the aforesaid town," shall cease during the said three years, on account of the necessity of enclosing the said town. Herefrom we may perhaps infer that the Trent Bridge was now sufficiently complete for traffic, so that further operations might be postponed.

This year the chapel of St. James on the bridge was completed, the first two chaplains being instituted on November 23, 1322. The first chaplain of a chantry she had founded in Stapleford Church was instituted on the same date. Like other chantry founders, Alice le Palmer reserved to herself the rights of presentation so long as she lived, directing that after her death such rights should revert to the priory of Newstead, to which her ancestors had given Stapleford Church.

We next read of the bridge works on December 17, 1324, when the king addressed letters to the town authorities forbidding them to take further customs for murage by virtue of an unexpired license, "for the king has now granted to Alice le Palmer and Hugh de Stapleford that they may take certain customs upon things for sale coming to that town until the end of three years, in aid of the repair of the bridge of Hethbeth and the bridge of the new breach near it."

On April 30, 1327, the king granted a "protection" to Alice le Palmer for two years. No doubt this had to do with the raising of further money for the work of the bridge. On May 3, 1327, there was an extension for one year of the former grant of pontage to Alice le Palmer and Hugh de Stapleford for the repair of the bridge of Hethbeth, &c., and likewise a mandate to repair the same by view of two burgesses. Three days later, on May 6, 1327, the king directed the men of Nottingham to cease collecting murage during the corresponding period, "as the king has granted to Alice le Palmer that she may take such customs until Christmas next and for a year from then in aid of repairing the bridge of Hethbeth, and the king is unwilling that divers customs shall be taken in the town from one and the same thing."

We have an interesting item under the date of November 8, 1327, when there was a royal grant to Alice le Palmer, "in consideration of her great labours and expenses on the construction and repair of the bridge of Hethbeth, over the Trent by Nottingham, that she be quit from payment of the 20th, lately granted by Parliament, and of all taxations, aids, tallages, &c., while engaged on such work."

On January 6, 1328, a commission was despatched to survey the Trent Bridge, &c., and "to audit the accounts of Alice le Palmer and Hugh de Stapleford, collectors of the pontage granted by the late king for the repair of the bridges, and to take inquisition as to the amount received and the amount expended." One would imagine that the report of the auditors was a favourable one, for on August 30, 1328, there was another extension for one year of the grant of pontage to the lady bridge-builder and her brother under the supervision of two burgesses.

But at this period undercurrents were at work, for in a few months time a change came over the scene. On May 10, 1329, a royal mandate was issued ordering Alice le Palmer to cease collecting pontage until otherwise ordered, "as the king learns by trustworthy testimony that the said bridge is now repaired, and that William de Amyas, now mayor of Nottingham, intends to repair out of his own goods all bridges between Leen Bridge and Trent Bridge, and that he has begun, and that Alice has expended nothing upon the repair of the bridge of Hethbeth since Michaelmas last, although she has continued to levy the tolls."

This is the last we hear of Alice le Palmer and her devoted labours. We may reasonably assume that she was in her decline, which would account for the alleged decrease in her activity, for she was dead within two years of this time. If it be true, as stated above, that the bridge was then "repaired" or completed, she lived to enjoy the crowning triumph of fulfilling her lifework, though evidently without securing the gratitude of the contemporary city fathers. Her only monument to-day is represented by the two southernmost arches of the bridge she built, adjoining the Trent Bridge police station, and supporting the inclined approach to the Lovers' Walk. Her life of perpetual self-sacrifice is but roughly outlined by the records we have quoted of six centuries ago.

TESSERÆ.

Applied Art in England.

THE story of the acanthus, as the origin of the Corinthian capital, is known to every schoolboy. There are, if not acanthi, at least other plants in every conservatory in England capable of suggesting hundreds of the like agreeable combinations. Ornament is but nature deprived to a certain extent of one of her features, variety, and brought under the dominion of geometrical rules. The English school has shown itself particularly deficient in ornamental art, and it will be better at once to acknowledge the error, and endeavour to find out its cause, than to attempt to mask an inferiority apparent to even a casual observer. There is no natural inability in the Englishman to excel in ornamental or decorative art, but he has never been placed in circumstances so to do. The foreigner, whether he be a worker in metal or a designer for textile goods, whether he be a house-decorator or a modeller in the potteries, is educated for the particular branch to which he devotes himself; he is well read in his art, he has passed half his life studying in galleries or collections containing the *élite* examples of his calling; he is, in fact, not only by right of his talent an artist, but he is also one who has devoted his whole energies to the walk in which he practises, and art on the Continent is of so varied a nature, and so universally spread among all classes of society that he suffers no degradation from turning his attention to that which we term manufacture, but which, with them, is almost as much high art, in one sense of the word, as are painting and sculpture with us. Not so in England; art with us moves in a more limited sphere. What talent we possess is devoted to the three recognised walks, painting as understood in its legitimate style, sculpture in its simple pure manner, and architecture on its grandest scale. An artist, obliged by circumstances to desert these and turn his thoughts to decorative works, feels that he has lost caste, and not only that, he enters into a class of art of the peculiarities of which he knows little, and his method of designing, his way of thinking, his manner of combining forms are in consequence unsuited to what he is then called upon to perform. In truth he is, in nine cases out of ten, one who, either from want of talent or industry, or, to speak charitably, from want of opportunity, has failed in that which he first tried, and has been obliged to devote himself to other and less difficult tasks. Need it be said that this person is in no condition to contend with his foreign competitors, even leaving out of the question the lack of appreciation for such things here? It is pleasant

however, to illustrate an assertion like this by looking at the opposite side of the page, and pointing out exceptions to sweeping, and may be censorious remarks like the above, but it must be understood that we consider them merely as exceptions, and that as such they do not alter the argument; on the contrary, if the effect be found to vary with the cause it serves as evidence that we are correct.

Some Nineteenth-Century Sculptors.

Bacon, and afterwards Flaxman, had dealt largely and liberally with the allegories of the ancients, and endeavoured to derive from them a language suitable to the purposes of modern times. Some of the absurdities committed not so much by these men as by lesser ones, who were their contemporaries, caused from time to time a shrug indicative of fear lest what had been intended for poetry might be looked upon as bathos. A thought seemed passing through the public mind that art in being allegorical had not always become intelligible; a more sedate view of matters seemed growing into vogue, a greater respect for facts, a treatment more commonplace, perhaps, but less deviating from what sober judgment might approve of. Poetical or imaginative sculpture, which had never been in high demand except for monumental purposes, fell into disrepute; portrait sculpture, to a certain extent, took the place of the other in public favour. Men were found to excel in this as in the other branches of the art when a call was made for them. Nollekens ventured in his busts as well as his figures to depart from the severity of the antique, and copy minutely individual nature as well as modern costume. Chantrey engrafted on the style of Nollekens greater knowledge of human character, greater mastery over the expression of the human countenance, as well as greater freedom and propriety of treatment in his draperies and modern dresses. Never soaring high into the regions of poetry, nor ever too literal in his ideas, he managed by his genius, which was ever guided by sound judgment, and by the policy he pursued through life to gain for himself the public favour to such an extent as to amount at one time to almost a monopoly. If his works do not quite support the reputation he held in his lifetime, it may be attributed to his want of anatomical knowledge of the human figure, which sometimes showed itself, and rendered his productions not altogether satisfactory or correct. In his busts, however, he is unsurpassed, and these alone will serve to preserve his fame entire. The death of Chantrey rendered sculpture in this country to a species of crisis, from whence may be dated a new state of affairs, certainly with regard to sculptors themselves, and we think we may say with regard also to their art. Almost the last of a set of artists who, though not numerous, had engrossed to themselves the patronage of the public for a considerable number of years, a question seemed to arise at his death whether, in showering favours so liberally on a few, the patrons of art had not done injustice to many who had been struggling for fame in comparative obscurity, but who might possibly with proper encouragement have displayed as much genius or talent as those who had hitherto completely engaged the eye of the world. It was found that commissions in art, given upon the strength of high reputation, had not always produced what that reputation warranted the expectation of. It was discovered that the loading of one or two artists with many commissions led in some instances—at least, where avarice was stronger than real love of art—to thoughtless conceptions and slovenly execution. A reaction took place; instead of those who were already in the enjoyment of public favour, and in many instances had gained it justly by their talent, a disposition arose to try younger and unknown artists. Competition was called in to remedy the evil which monopoly had created.

Egyptian Sepulchral Vases and Boxes.

These vases made of alabaster, calcareous stone, porcelain, terra-cotta, and even wood, were destined to hold the soft parts or viscera of the body, embalmed separately and deposited in them. They were four in number, and were made in shape of the four genii of the Karneter or Hades, to whom were assigned the four cardinal points of the compass. The body of the vase was that of the genius, and the head mortised into it was the cover. The names and order of these genii were Amset, human-headed, the first genius, and the body of his vase held the stomach and large intestines; Hapi, the second, cynocephalus type, held the small intestines; Tuautmut, the third, jackal-headed, held the lungs and heart; and Kabhsenuf, the fourth, the liver and gall-bladder. They were separately embalmed, were made into oval packets and placed in the vases. These vases are either plain, with the name of the genius which they represent, or with a particular formula, ending with the name of the deceased. The formulæ are speeches respectively made by Isis, Nephthys, Neith and Selk on behalf of the deceased. The vases were placed in boxes with partitions, then set on sledges and drawn to the sepulchre with the other funereal apparatus. In the vignettes of the "Ritual," chapter 89, and in the paintings of the coffins, they are represented placed

under the bier on which the mummy is laid. They are found in the tombs in different positions, sometimes at the corners or angles of the coffins, in niches in the walls of the sepulchral chamber, or in the boxes with partitions in which they were taken to the sepulchre. Only the richer persons had these special receptacles, the viscera being often made into separate packets disposed close to the mummy and covered with the bandages. The boxes used for these purposes exhibit great variety of shape and decoration, but all are rectangular, some divided into two or more compartments, and their covers either vaulted or flat. The subjects represent adoration to the principal sepulchral deities, and the inscriptions with which they are inscribed are either chapters copied from the sepulchral ritual, or dedications to Osiris and other deities of the dead. None of them appear to be older than the eighteenth dynasty, and most of them are of the twenty-first and following dynasties, till the Roman period of the first century A.D. They were deposited in the tombs at the side of the coffins. They are made of sycamore wood, and, like the boxes in use for private life, had no locks, being secured by strings tied to a stud in the cover and another in the body of the box.

The Tower of London.

The building that Shakespeare calls "Julius Cæsar's ill-erected tower" was a Roman stronghold for a thousand years or more before the Norman king caused one stone of the great White Tower to be laid upon another. It was not until eighteen years after the Conquest that William turned his attention to fortifying the river approach to London. He summoned as his architect Gundulf, the weeping monk of Bec in Normandy, a Benedictine of considerable acquirements, whom travel had made familiar not only with the best specimens of architecture in his own country, but even with the more ornate school of the East. He is said to have been a pupil of Lanfranc and the friend of Anselm, and it is evident that he had acquired considerable fame as an artist before he was called away from his cloister to become the chief builder to King William. "But," says Hepworth Dixon, "he was chiefly known in the convent as a weeper. No monk at Bec could cry so often and so much as Gundulf. He could weep with those who wept; nay, he could weep with those who sported, for his tears rolled forth from what seemed to be an unfailing source." This melancholy man was made Bishop of Rochester, the cathedral and castle of which city were designed and built by him, and it is in a "fair Register Book of the Acts of the Bishop of Rochester, set down by Edmond of Hadenham," that Stow finds it recorded that "William I., surnamed the Conqueror, builded the Tower of London, to wit, the great white and square tower there, about the year of Christ 1078, appointing Gundulf, the Bishop of Rochester, to be principal surveyor and overseer of that work, who was from that time lodged in the house of Edmere, a burgess of London." So Gundulf wept and built, and Ralph Flambard, Bishop of Durham, found the money, little wotting that he was taxing and robbing the people to erect a prison for himself. Probably the earliest description of the Tower of London is that quoted by Stow of Fitzstephen, who lived in the twelfth century:—"The city of London hath in the east a very great and most strong palatine tower, whose turrets and walls do rise from a deep foundation, the mortar thereof being tempered with the blood of beasts." Perhaps Gundulf pounded up the old red tiles and bricks of the Romans to mix his mortar, and the people, only too ready to surround with new glamour the great threatening tower that was springing up in their midst, accounted for the colour in this way. Gundulf is said to have lived to the age of eighty, and to have seen the completion of the works which he designed about the Tower, including a church dedicated to St. Peter, which stood on the site of the present chapel of St. Peter ad Vincula.

English Sculpture.

England is very rich in its series of ecclesiastical and monumental sculpture from the earliest introduction of that class of art in this country. There are effigies in low relief of two abbots of Westminster in the eleventh and twelfth centuries. The statues which decorate Wells Cathedral are also remarkable. At first all sculpture to commemorate individuals was confined to the ecclesiastics, the clergy having the exclusive control over these works. The earliest monumental effigy of a king is that of John in Worcester Cathedral, the date 1216. The next of royal personages are those in bronze in Westminster Abbey, of Henry III. (1272), and of Eleanor the queen of Edward I. (1290). From this time there is a continued succession of such works, which are not only highly valuable from their historical importance, but for the illustration they afford of the changes in the style of monumental design. Some of those of the end of the fourteenth and the fifteenth centuries are particularly rich in design, and deserve attention for many valuable qualities of art. It will be observed that, from its commencement till about the end

of the sixteenth century, monumental sculpture exhibits the influence of the religious feeling of the earlier ages. It was, of course, modified in its forms and mode of representation, as may be seen in numerous examples of easy reference that abound in our cathedrals and older churches, but everywhere the prevailing sentiment was religious. Figures, whether they are lying recumbent on their tombs or kneeling, a posture not so often met with in the principal subject in early monumental sculpture, are usually represented praying; or if not literally occupied in the act of prayer, they generally have accessories or accompaniments referring to religious exercises, or are attended by ministering angels, either supporting the cushion at the head or grouped at the feet of the person represented. Of course there are exceptions to this rule, as in the effigies of the knights in the Temple Church and others that might be mentioned; but generally the sentiment described was the prevailing one in this class of works. In the sixteenth century a departure from this characteristic of church sculpture is observable, and in a few years all reference to the religious character in such works is lost sight of. The taste exhibited in monumental design of the date of Elizabeth and James I. is exceedingly bad, but after that time this class of art still further deteriorated, and the monuments produced in the latter part of the seventeenth century are for the most part entirely wanting in the associations which seem to be so essential in works of this kind.

GENERAL.

The Bishop of Truro on Wednesday dedicated the nave of the cathedral in the presence of the Prince and Princess of Wales.

The French Government have made its annual purchases at the Salons of the Society of French Artists and of the National Society of Fine Arts. The architectural works selected from the Salon were *The Palatine Chapel at Palermo*, by M. Mors, and the tiled pavement in the church of St. Jacques, Boulogne, by M. Polart.

The Tynwald Court have decided to purchase the leased demesne hitherto occupied by the Governors of the Isle of Man. This action is in consequence of Lord Raglan's refusal to live there on account of the insanitary conditions. An extensive scheme of improvement, costing several thousands of pounds, will be undertaken.

Glasgow University Court last week gave instructions for the acceptance of tenders for the construction of two new buildings—(1) for the department of natural philosophy; and (2) for combined buildings for the departments of physiology, materia medica and forensic medicine, and public health. The work is to proceed at once. The cost of each of the two buildings is to be 40,000*l*.

The International Society of Sculptors, Painters and Gravers have elected Mr. Howard Pyle an honorary member, and Messrs. Maurice Greiffenhagen, W. Y. MacGregor and Douglas Robinson associates.

A Public Monument to Leo XIII. in Rome is being prepared, called the International Working Men's Monument. It is a statue about 11 feet in height, representing a working man surrounded with the symbols of labour, raising his eyes towards a cross held in the right hand. On the cross is the inscription in Latin, "In this sign thou shalt conquer." At the sides of the monument are three encyclicals on labour issued by Leo XIII.

M. Besnard has been commissioned to decorate the lobby of the Palais des Beaux-Arts in Paris. The work will take him five years to complete, and his honorarium has been fixed at 12,000 francs a year.

The Canadian Government propose to assist the local iron industry by granting a bounty of 6 dols. per ton for the manufacture of wire rods to be used in Canada for further manufacture, and of 3 dols. per ton on angles, beams, other structural ironwork and on large steel plates. These are not at present made in Canada, but the Dominion Steel Company is erecting plant for their manufacture.

A Memorial in favour of Mr. Thornycroft's suggestion for the further improvement of the Strand, by altering the northern line of frontage near the Law Courts, was presented to the London County Council on the 13th inst.

The London County Council have approved the plans submitted by Mr. F. Matcham, on behalf of Mr. Oswald Stoll, of a building to be known as the Coliseum, which it is proposed to erect upon the site of houses abutting upon St. Martin's Lane, Bedfordbury and May's Buildings.

The International Fire Prevention Congress passed various resolutions, which include the following:—That the term "fire-resisting" be adopted in place of "fireproof," as being the more applicable for general use; that the standards of fire-resistance shall be (1) the temporary protective class,

(2) the partially protective class, and (3) the fully protective class; that testing stations for fire-resting materials be established, and a universal method of testing be adopted; that courses of study be provided in universities, technical colleges and schools for the instruction of engineering and architectural students in the fire-resistance of building materials and the methods of construction as based on investigation; and that in all cases of fire an official inquiry shall follow.

A Party of Members of the Manchester Society of Architects recently made a sketching visit to Whalley and Mytton Churches, and to Stonyhurst College, the Early Renaissance portion of which provided some interesting subjects. The rain unfortunately prevented a good attendance at the visit to the new car depôt in Hyde Road. Mr. J. Gibbons, the architect, kindly explained the design and construction of this very interesting building, the first part of which is now approaching completion.

The International Society of Sculptors, Painters and Gravers have been invited by the leading American academies and art institutions to exhibit the work of the members in the United States. The Society have accepted the invitation, and exhibitions, commencing in October, have been arranged for in the Pennsylvania Academy of the Fine Arts, Philadelphia; the Carnegie Institute, Pittsburgh; the Cincinnati Art Gallery, and the St. Louis Museum of Fine Arts, during the period of the Exposition in that city.

A Bronze-coloured facsimile of Stevens's plaster model of the equestrian figure for the Wellington monument, with certain missing parts supplied from his sketch model, has now been placed in position in St. Paul's Cathedral, and will be open to public view by permission of the Dean and Chapter until the end of this week. The advantage of such a figure is evident, but from the height it is almost impossible to judge of details.

An Illustration of the memorial of Charles Garnier has appeared in the last number of *La Construction Moderne*. It is on a large scale, and does justice to the work of M. Pascal and M. Thomas.

Woodwork and Carving ascribed to Grinling Gibbons, and now fitted in a room of No. 3 Clifford's Inn, with bolection moulding, chair rail and deep skirting, four doorways, and a chimney-piece surrounded by rich carving, will be sold by auction by Messrs. Farebrother, Ellis, Egerton, Breach & Co. on Thursday, July 23, at noon.

The Beni-Hasan Excavation Committee have an exhibition of Egyptian antiquities in the rooms of the Society of Antiquaries. It will remain open until the 25th inst.

At a Meeting held recently in Manchester it was unanimously resolved that it is desirable to hold an international exhibition in that city in 1905, and a committee was appointed to take such steps as are considered necessary to ascertain the views of those likely to be interested in such a project.

The London County Council have adopted some new by-laws which include the following:—Every person who in any street, to the obstruction, annoyance or danger of residents or passengers, orders or permits any person in his service to stand or kneel on the sill of any window for the purpose of cleaning or painting such window, or for any other purpose whatsoever, such sill being more than 6 feet in height from the level of the ground immediately below it, without support sufficient to prevent such person from falling, shall for every such offence forfeit and pay a sum not exceeding 5*l*. Every person who in any street, to the obstruction, annoyance or danger of residents or passengers, stands or kneels on the sill of any window for the purpose of cleaning or painting such window, or for any other purpose whatsoever, such sill being more than 6 feet in height from the level of the ground immediately below it, without support sufficient to prevent such person from falling, shall for every such offence forfeit and pay a sum not exceeding 20*s*. The by-law as to window-cleaning or painting is in substitution for one previously in force, the by-law having been amended so as to cover the case of kneeling on window sills.

The Trustees of the National Gallery in their latest report announce that the whole collection of framed portraits has been placed under glass with the exception of four portraits and three very large groups, which it is not deemed expedient to glaze owing to the difficulty of viewing them in their present position; they are, however, protected by barriers and placed under the constant supervision of the attendants and police. The collection now consists of 1,248 pictures and engravings, 158 works in sculpture, and 41 miscellaneous portraits exhibited in cases. The number of students who have applied for students' tickets during the past year is 41, and 35 students have had their tickets renewed. The total number of visitors admitted on the Sunday afternoons of the summer months was 12,528, an average of 417 per Sunday. The total number of visitors from January 1 to December 31, 1902, was 151,352, of whom 130,583 were admitted free of charge.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

SCOTLAND.—Competitive plans are invited for a new hospital for the treatment of infectious diseases, which is to be erected at Cloverhill, near Ayr. Mr. David W. Shaw, district clerk, 5 Wellington Square, Ayr.

TAUNTON.—July 20.—Competitive designs are invited for a library building to be erected in Corporation Street, at a cost not exceeding 5,000l. inclusive. Premiums of 30l., 20l. and 10l. will be awarded for designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. George H. Kite, town clerk, Municipal Buildings, Taunton.

CONTRACTS OPEN.

BARROW-IN-FURNESS.—July 24.—For the enlargement of the post office at Barrow-in-Furness. Particulars and forms of tender may be obtained at H.M. Office of Works, &c., Storey's Gate, London, S.W.

TRADE NOTE.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied a number of their patent Manchester grates to the new naval barracks, Portsmouth.

NEW CATALOGUE.

A VERY complete catalogue of furniture and fittings for schools, colleges and gymnasia is now being issued by the North of England School Furnishing Company, Ltd., of Darlington, a firm devoting a large amount of attention to the hygienic aspect of school furniture and its adaptability to the needs of growing children, in order that their physique may be developed at the same time as their intellects. With this object in view the firm have introduced a number of adjustable desks and seats of various descriptions, which can be so arranged by an ingenious mechanism as to avoid the stooping and cramped positions which children so often assume during their studies, and which are so inimical to their growth. Other specialties of the firm comprise fittings for technical schools, laboratories, public and other libraries, &c.

VARIETIES.

THE German Emperor has conferred the large gold medal for art on Mr. John Sargent, R.A., and the small gold medal for art on Mr. Edwin Abbey, R.A.

A NEW Baptist church was opened on the 8th inst. in Hither Green, the site and building having cost 6,575/. This is one of the thirty odd churches founded by the London Baptist Association.

THE new school-church which the Primitive Methodists have built in Third Avenue, Trafford Park, Manchester, was opened on Saturday. Accommodation is provided for over 300 worshippers, and the total estimated cost is 2,200/.

THE employes of Messrs. Waygood & Otis, Ltd., spent an enjoyable day on Saturday last, when the firm's London cricket eleven went down to Coventry to play in a match between them and the country works eleven, in which the latter were victorious, making 120 against the Londoners' 94. Prior to the match the teams and their supporters lunched together at the White Lion hotel, the chair being taken by Mr. D. W. R. Green, secretary.

THE new and substantial stone bridge built by the Kent County Council over the Medway in Hampstead Lane, near to the railway station, was opened on the 8th inst. The new bridge succeeds an old wooden structure, and provides an excellent approach to the station and very serviceable vehicular communication between the districts on either side of the river. It is an attractive erection of Kentish ragstone, with railed approaches of iron tubing and a parapet wall of ragstone. The approaches extend some 1200 feet on either side, and have a gradient of 1 in 20. The bridge itself is of steel girders, with Hobson's patent flooring, both girders and flooring having been supplied and fixed by the Cleveland Bridge and Engineering Company, of Darlington. There is a clear roadway of 16 feet 6 inches and a 4-foot path. The bridge crosses the river almost at an angle of 45 degrees, and allows barges 9 feet 6 inches head room and a waterway of 21 feet. In addition there are five land arches, 10 feet in breadth, for the accommodation in flood time of the extra water. The strength of the bridge will admit of any traffic, including all kinds of steam tractions. It has been erected by Messrs. Wallis & Sons, of Maidstone, to plans and specifications prepared by Mr. F. W. Ruck, the county surveyor, and the contract price was 4,150/, the total cost being 4,400/.

ELECTRIC NOTE.

THE new lighthouse which has been erected by the German Government on the island of Heligoland is notable, says the *Birmingham Post*, because, although it is claimed to have one of the most powerful lights in operation, it is made with the old parabolic reflector, with a powerful illuminant at the focus in place of the Fresnel lenses and prisms. An arc light, with a current of 34 amperes, is the illuminant, and it is stated that the candle-power is 30,000,000. The lamp is so arranged that a flash is given every five seconds, and its duration is only one-tenth of a second. This is the same length of flash as adopted by the French authorities, but experts are by no means agreed that it is long enough. It would certainly be sufficient on a clear day, but when the atmosphere is hazy it is doubtful if one-tenth of a second is long enough to make an impression on the eye. It is said that on the first night of trial the light was seen for a distance of forty miles.

TO BOROUGH ENGINEERS, SURVEYORS, ARCHITECTS, &c

Hassall's Patent Water Closet.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE, 1902.

IMPORTANT IMPROVEMENT IN FLUSH-DOWN W.C.'s.

SECTION.

ADVANTAGES.

Excelsior and Rawdon Potteries,

BUILDING AND BUILDERS.

A WELSH Calvinistic Methodist chapel, costing 8,000*l.*, is to be built at Llandudno, to supersede the present building.

THE foundation-stones of a new Wesleyan church and schools to be erected at Hales Owen Road, Old Hill, Birmingham, at a cost of 4,500*l.*, were laid.

THE last stone of the new Aberystwith promenade, constructed by the Corporation at a cost of 12,000*l.*, has been laid. The new structure is about half a mile long, running due south, and contains a carriage-road as well as an esplanade.

ON Saturday Sir Thomas Brooke laid one of the principal stones of a new chancel which is to be erected at Christ Church, Mold Green, Huddersfield. The church has been without a chancel for about forty years. The new chancel will, with the redecoration of the church, cost about 1,900*l.*

A LOCAL GOVERNMENT BOARD inquiry has been held into the application of the Seiston Rural District Council for sanction to borrow 14,000*l.* for purposes of sewerage and sewage disposal. The scheme was prepared by Mr R E W. Berrington, M.Inst C.E., of Westminster and Wolverhampton.

THE building strike in New York, now ended, kept 115,000 men out of work for fifty-one days. The cost in wages to labourers was 17,839,020*l.* on the prospective profits; the expenses to contractors totalled 30,000,000*l.*, and to working-men in allied trades 18,000,000*l.*, making a total of 66,839,000*l.*

PLANS have been accepted for the new post office which it is intended to erect for the burgh of Linlithgow. They show a one-storey building, and accommodation for public office, instrument-room, telephone-room and boys' room facing the street, with postmaster's-room, large sorting office, and postmen's-room and store behind. The plans have been prepared by Mr. W. W. Robertson, of H.M. Board of Works, Edinburgh. Messrs. Bakie & Peattie, builders, Bo'ness, have secured the contract for the work.

COLONEL R. A. DURNFORD, R.E., Local Government Board inspector, held an inquiry at the Gorton town hall into an application by the Gorton (Lancs) District Council for sanction to borrow 8,816*l.* for the provision of a refuse destructor on a site adjoining the Gorton outfall sewage works. The site is between 400 and 500 yards from the Belle Vue

Gardens, and Mr. Charles Jennison opposed the application because of its proximity to the gardens. Mr. Lord appeared for the Gorton Council, and explained that the population of the district was 28,000, the assessable value 75,730*l.* and outstanding loans 91,764*l.* The scheme was, he said, a good one, the Council had selected the best site and a destructor was most necessary, the population having almost doubled in the last ten or twelve years. Mr. Singer (clerk to the Council), Mr. Howarth (assistant engineer to the scheme), Councillor Wainwright (chairman of the health committee), Dr. Martin (the medical officer of health), Mr. G. Watson (of the Horsfall Destructor Company) and others gave evidence in favour of the application. Mr. Jennison, in explaining the reasons for the opposition of the proprietors of the Belle Vue Gardens, said they had a very large interest at stake. Much land had been purchased around the gardens for the purpose of keeping down any nuisance, and they were very chary about allowing anything to come near Belle Vue that might possibly be injurious. It was difficult, even at the present time, to keep the trees in the gardens alive and maintain the vegetation in anything like reasonable order. The Inspector afterwards inspected the site, and said the result of the inquiry would be intimated in due course.

At a meeting of the Tamworth joint waterworks committee the manager (Mr. H. J. Clarson) emphasised the necessity of having a quantity of water in reserve, because several times the existing reservoir has been practically empty. The height of water in the well on July 13 last year was 22 feet 6 inches; this year it was 20 feet 7 inches. He suggested the construction of a small reservoir at Hopwas. The committee afterwards resumed consideration of the report of Mr. D. F. Worger, an expert, who was called in to advise the committee on the matter, and in the end Mr. Morgan proposed that a new reservoir to hold 500,000 gallons be provided at Hopwas, near the existing works. Dr. W. Marris seconded, and the proposition was agreed to with one dissentient (Mr. F. G. Alton). It was stated that the cost of the proposed reservoir would be an average rate over the whole water area of 1*o*36*d.* Mr. Worger estimated the cost of the reservoir as proposed to be 4,370*l.*, while the committee's manager's estimate totalled 5,417*l.* It was stated by the chairman that the difference in the estimates was entirely in the cost of construction.

PROCTER'S PATENT WINDOW.

THIS ventilating and weatherproof window which we illustrate is being exhibited at the Sanitary Institute's Exhibition at Bradford, and possesses more than one special feature. The window is formed of two wood casements which open inwards; above them is fixed a fanlight window which drops into a groove, and at the top can be pushed back and locked

or brought forward until it self-locks. Behind the architrave is an air passage from the room to the open air, and when the fanlight is brought forward there is a clear passage for the current of air to pass straight into the room directed towards the ceiling. By means of this arrangement the window, although securely locked, admits fresh air at any time, there being no necessity to close it at night or when the house is locked up in the absence of the tenant.

The fanlight being held in position without fastenings or hinges, excepting the bolt at top for securing it either open or shut, can be easily lifted out, and with the casements open gives an opening the full size of the window. Besides the advantages of ventilation without draught or damage to the curtains, these windows form a perfect safety window, as both inside and outside can be cleaned from inside the room, no special fittings being required to effect this. Fig 1 shows the action of this window.

In fig. 2 will be seen the patent tipping weather bar, fixed to the bottom of casement. When the window is closed it falls into its place, and, as will be seen, the greater the wind pressure the more perfect is the seal over the joint outside.

THE SANITARY INSTITUTE EXHIBITION.

THIS exhibition, organised by the Sanitary Institute at Bradford in connection with their twenty-first annual Congress, was formally opened by the Mayor on the 7th inst. and will continue until the 25th inst. It, indeed, forms a very important section of the Congress, for while the papers read and discussed are of great interest, dealing with a great variety of subjects where improvements are possible and often necessary for the health and well-being of the community, by means of the exhibition practical demonstrations are afforded to the delegates and visitors of the latest improved methods of sanitation, and the exhibitors may be congratulated that by their co-operation these are of such a comprehensive character. A brief description of those exhibits appealing more directly to our readers will doubtless be read with interest.

Messrs. Doulton & Co., Ltd., are represented by an extensive display of baths, lavatories, closets, cisterns, urinals, &c., some being specially designed for hospital use, and the fact that they received four awards from the judges is proof of the general excellence of their exhibit. The gun-metal mixing valve for hot and cold water, awarded a bronze medal, so controls the supply to the bath that cold water must first be turned on, then the hot water is mixed with it, giving a tepid supply, and finally, by shutting off the cold, hot water only is given, all, of course, through the same tap, a removable combined standing waste and overflow being carried through the centre of it. These are fitted to a vitreous enamelled—inside and outside—recessed bath, with soap-dishes made on the rolled edge on each side of the valve. The "Syphonic" and "Waverley" closets, both of which gained a bronze medal, have an extra large water area, and in the former the seat is fitted to extensions either bolted through or hinged. The "Waverley" is fitted with the improved "Paisley" cisterns, also awarded a bronze medal, which, with a 2-gallon flush, thoroughly cleanses the whole face of the pan, and fitted also to the "Simplicatus" closet, gives a 3-gallon discharge in four seconds. This closet has a balance seat fixed to lugs or extensions. The special closet for schools is designed to replace automatic syphon closets, and is fitted with independent cisterns. It takes very little space, the outlet being made to turn to one side, either right or left hand, and is fitted with an inspection cap to trap, giving easy access either for inspection or cleaning out. The "Vulcan" urinals in white-glazed fireclay have the back and

base in one piece, reducing fixing to a minimum, with open weir outlet to channel covered with loose gratings, allowing it to be easily cleansed. The operating-room lavatories are fitted with hot and cold combined valves, with lever handles so arranged that they are worked by the arms, avoiding any necessity for the hands to touch them, and preventing the possibility of contamination to the fittings. For greater cleanliness, all the hospital lavatories, &c., are made to stand clear from the wall. A white vitreous enamelled mortuary table on pedestal, fitted with ball bearings, with brake, enabling the operator to fix it in any position, and special facilities for cleaning out wastepipe, &c., is also shown. We have only space to mention that Messrs. Doulton & Co., Ltd., have a good display of white-glazed baths and marble lavatories, all of which are excellent.

Messrs. Shanks & Co., Ltd., at their stand close to the above, exhibit the "Perfecto" bath, vitreous enamelled on the inside and outside, having a syphonic outflow that can be easily removed and a 2½-inch full-way waste. Model lavatories with nickel or oxidised fittings supported on marble slab floors are shown in various designs. For schools individual closets with cistern to each, as supplied to the Manchester education committee, are a special feature, and are fitted with inspection cap to trap, while an enclosed rod in place of a chain is used for emptying the cistern.

Messrs. Joseph Cliff & Sons have an extensive and interesting exhibit of many of the specialties manufactured by them, and were awarded bronze medals for the following:—The Newcliff intercepting trap, with special inspection cover; the Hessel-Tiltman scum channel for swimming-baths, made in white enamel fireclay and forming spittoons at intervals which are washed out by water flowing through the channel; and for the "Imperial" bath, patented and registered. This bath of white-glazed fireclay is novel as regards its shape, being designed with the object of giving more room at the head of the bath—at that end the sides being extended outwards forming an oval, giving greater freedom to the arms of the bather—and has other special features, the principal one being the introduction of fluted sides at the foot end, into which can be placed a slide covered with cocoanut matting, either for shortening the bath for children or forming a hold for the feet. The "Imperial" porcelain parallel bath, having straight sides, is an excellent comparison to the above, with lavatory and bathroom accessories complete, the walls being of Burmantofts faience. In addition Messrs.

54 to 58 Castle Street, Long Acre, W.C.

Manufactory: White Lion Street, Long Acre, W.C.

Cliff exhibit a range of "Empire" urinals, a variety of lavatories, the "Imperial" mortuary slab and pedestals, hospital sinks, hospital closets without woodwork, improved pattern "Modern" washtubs and shampooing basins, hollowed at back of pedestal, enabling the fittings to be easily fixed; also examples of their well-known white and coloured and salt-glazed bricks, Tiltman's and the Shepwood patent partition bricks, Hall's hanging tiles, "Wyvurst" patent channels, Winsor's bends and channels, Border's patent sectional man-holes, "Tron" inspection eye, gullies, traps, sinks, &c. A word of praise must also be given to the specimens of terra-cotta; the "Fios" test-recorder for self-registering movements of water surface in manholes, drains, cisterns, &c., is also shown.

Messrs. Oates & Green, Ltd., occupy two stands, and on each is plenty to repay inspection. Dealing with the smaller one first, there are displayed samples of the sanitary stable fittings and cattle troughs, of which this firm make a spécialité, including a range of salt-glazed fireclay feeding troughs, providing a separate water supply and manger for each animal, a waste below the inflow keeping the water at a proper level, preventing it flowing into the next trough or contaminating the supply. A 6-feet glazed fireclay sanitary manger, with give-and-take fastener, and small feeding troughs are shown, also samples of salt-glazed Nalethric stoneware pipes, and white enamelled fireclay channels, bends, &c. On the larger stand is prominent a range of salt-glazed urinals as supplied to Windsor Castle; also white enamelled "Taper" and "Otis" urinals, with sloping backs and channels, being made in one piece, the sloping backs ensuring a thorough cleansing, the whole surface being flushed by the automatic apparatus. A large variety of lavatory basins are displayed with special features. For schools they are round-fronted and fitted with lugs for building into walls; a range of white enamelled fireclay slab basins and pedestals with skirting at back, and returns and overlapping joints, are for public institutions; while others are designed for hotels, clubs and private houses, and in these the taps are arranged not to extend into the basins, but are recessed at the back. Special closets for workmen, and hospital bracket closets clear underneath to the wall, waste water-closets, as well as white enamelled fireclay washdown closets, are a feature of this stand; also syphonic latrines with flushing rims and after-flush, and "Isolt" latrines with automatic flush and separate trap made in one piece with the pedestal, giving perfect isolation.

Messrs. Holroyd & Co. have a fine display of fireclay baths, lavatories, &c., of American manufacture, a bronze medal being awarded for the excellence of the ware in addition to one for the crystal drinking-fountain, a bowl and pedestal in one piece. The water issues as a miniature fountain by pressing down the valve in centre of bowl, over which the mouth is held. The porcelain baths, made either with base to floor or on pottery feet, are fitted with "Primus" combination supply and waste. The water may be drawn either hot, tepid, or cold, the supply being carried low down into the bath. The "Prompto" closet, fitted with "Simplex" flushing-valve, is of good appearance, and has a large water area with deep seal, but owing to the low pressure of water supply it could not be shown in action.

Messrs. Twyford, Ltd., have a very representative display of their well-known specialties. The "Nereus" w.c. combination complete, the Sicilian marble lavatories and anti-splashing bath with fittings well deserve attention. For hospital use the surgical lavatory, fitted with elbow taps and knee-controlled waste and revolving operating table, and pedestal and other urinals form part of their exhibit.

Messrs. J. Duckett & Son, Ltd., were awarded a silver medal for the isolated syphon closets, of which a range of four were shown, also automatic flushing tanks for 10 and 20 gallons, lavatory basins for schools, slop water-closets, wash-down closets, ranges of urinals in white and amber ware, sewer pipes with Hassell's & Button's joints, manhole inverts, gullies, traps, &c.

Messrs. George Freeman, Ltd., have a display of numerous sanitary specialties that is both interesting and comprehensive. They were awarded a bronze medal for the "Priory" alumine bath which they first exhibited at the recent Building Exhibition, and after witnessing the severe tests made by the judges we are confirmed in the good opinion we then expressed. They also gained a bronze medal for Brown's penny-in-the-slot lock for public conveniences, which is always under the control of the attendant, who can gain an entrance at any time in case of illness of the user. Freeman's patent double-seal pipe-joint has the following advantages:—It is quickly and easily made; it requires no skilled labour and little cement; it is a locking joint insuring concentric fitting and absolutely close-abutting of the pipe ends; when finished with a cement seal it has a strength and rigidity equalled by few and surpassed by no other joint. Hassall's patent suite water-closet, with 1½-gallon flush, was at Birmingham this year

Buildings, Ludgate Circus, London.

severely tested, and called forth a highly satisfactory report from the city engineer. Several of these were shown and also fitted to cisterns on other stands, and demonstrated the value of this closet Lavatory basins, with alumine fittings, taps, ball-valves and other brass fittings, also dados and panels in "Mansfield" tiles, were also exhibited.

The Valveless Syphon Co. had a good display of their well-known "Waterwitch" combination closets and syphon cisterns, showing their latest improvements, which are deservedly becoming more popular.

The Bradley Star Tap Co., Ltd., gained a silver medal for equilibrium and compensating ball, bib and meter taps. The Star tap has a full water-way for all pressures, and is so constructed that the pressure of the water holds the valve firmly closed when the cistern is full. In the "cup-leatherless" tap the valves slide freely in the cylindrical chamber of the tap body, which is hermetically sealed by a screwed tap, and has neither cup-leathers nor stuffing-boxes.

Messrs. Mather & Platt, Ltd., have a complete installation of a model sewage-purification works, showing that their system is adaptable to the various methods of treatment of sewage, the appliances shown demonstrating that they work either in contact or continuous filtering. The first part of their sewage treatment consists of a Detritus chamber fitted with a screen to prevent mineral solids, paper, &c., passing into the sedimentation or septic tanks, of which there are two here working in conjunction, but one can be held in reserve in case of repairs being necessary to the other. The next is the valve chamber, fitted with patent automatic distributing apparatus, which we have previously fully described. By means of flap valves automatically controlled the effluent from the sedimentation tank is distributed to the bacteria beds in regular succession and in controlled quantities. The bacteria beds are supplied by either fixed spreaders or patent revolving spreaders, and in the grounds adjoining the stand a revolving spreader and valve forming part of the scheme for the Delamere sanatorium for consumptives, Cheshire, are erected, the spreader being 38 feet, but spreaders are made by Messrs. Mather & Platt up to 200 feet in diameter.

The Hard York Non-Slip Stone Co. show flags, steps, landings, coping, channelling, also grooved flags for crossings and a section of their stone showing its workability, and were awarded the bronze medal. On page 25 we describe a visit paid to their works at Lightcliffe by members of the Congress, which we feel sure will be read with interest.

Messrs. Brookes, Ltd., have at their stand a fine display of Norwegian and Swedish granite setts, 2-inch and 2½-inch Myddleton macadam, 2-inch and 2½-inch Welsh macadam, 2-inch limestone and limestone setts.

Messrs. J. Defries & Sons, Ltd., show numerous specimens of the well-known Pasteur-Chamberland filters for domestic and institutional purposes, working with and without pressure; also Equifex disinfection appliances. The latest improved Equifex saturated-steam disinfectors renders it impossible for the air exhaust-valve to be closed until all air is ejected from the disinfectors, and prevents any disinfections being recorded on the recording gauge if performed with anything but pure steam. Messrs. Defries were awarded a bronze medal for Pakes & Barnes's milk purifier.

Messrs. Wilson & Stockall have as their exhibit their patent brougham ambulance and accident ambulance van, each of which gained the silver medal. In the brougham a new feature is introduced, the inner panel of the doors being hinged so that the whole of the inside of the doors may be disinfected after being used for infectious cases, which hitherto could not be properly accomplished. Another improvement relates to the stretchers, which are hinged, and can be raised instantly to a sitting position by simply pressing a lever. An improved hospital dinner-waggon is also shown.

Messrs. W. & R. Leggott, Ltd., have a most excellent display of builders' and general brasswork, including gearing for roof and lantern lights for regulating the amount of ventilation for electric-generating stations, hospitals, laundries, baths, &c., also wrought-iron and gun-metal casements fitted with the patent "Namdar" hinge, which allows the outside of window to be brought into the room for cleaning, and overcomes one of the objections to metal casements. Exit bolts for theatres, &c., and quick-opening gears for fire station and other doors are also shown, as well as many beautiful examples of electroplating on door furniture, &c.

Mr. Joseph Procter has for his exhibit his patent chimney-pot, which has proved most successful in curing smoky chimneys, preventing a down-draught, and creating an up-draught under all circumstances; also his patent ventilating and weatherproof window, of which we give a description in another part of this issue.

There are a number of other interesting exhibits that claim our attention, but want of space prevents us dealing with them until our next issue.

Nearly 100 delegates to the Sanitary Congress took advantage of the invitation to visit Lightcliffe, issued by Messrs. Brookes, Ltd. At Lightcliffe station the large private siding constructed by the Brookes firm debouches upon the main line. There the delegates disembarked. The siding which makes so conspicuous a mark from the window of the train might be more accurately described as a circle-railway, on which sturdy little locomotives pull the loads from the quarries and works upon the circuit. After luncheon, the company set off towards the open quarries at Yew Trees and Tuck Royds, and to one of the mines at Harley Head. The Silex quarries are operated in a large and strictly methodical fashion, so that the initial and final stages are carried on side by side as the rock is exhausted. The baring of fresh soil and blasting of worthless cover goes on simultaneously with the getting, splitting and riving of exposed stone. On the bank, dressing, tooling, sett-squaring and kindred processes are the first to take the eye. The bottom or Silex bed lies somewhat over 100 feet from ground-level. Its yield is distinguished by the fineness in colour and in texture, its supreme workability and freedom from "ray" no less than by a chemical structure of unwonted purity. Physically, the Silex stone exhibits a crushing strain of 2,200 tons per cubic foot, and its faculty of absorption is practically nil. Its freedom from lime renders Silex stone proof against atmospheric attack. The name Silex is, of course, a registered trade name denoting the best hard York stone obtainable. The need for some definite standard for specification induced Messrs. Brookes to introduce this convenient appellation. The name Silex is blazoned upon the great chimney-stalk adjoining the Silex stone works, where planing, sawing, polishing are done there by machinery, as is polishing by hand. Attention was directed to a display of the granite now being worked by Messrs. Brookes' Scandinavian branch, the A/S International Granite Company of Christiania. In acquiring their large estates in Sweden and Norway the firm has tightened its hold upon the granite trade. Ten separate and distinct quarries are in work, and the blocks that may be got are limited by nothing but the size of the steamers to convey them. Fine monumental granite, kerbs, landings, dock stones, setts and broken pieces in a variety of colours and textures are being got upon the ground now owned by Brookes, Ltd. An exhibit of their non-slippery granites took the highest award (bronze medal) at the recent Sanitary Congress. The adjacent premises of the Hard York Nonslip Stone Company is a reconstitution of Silex rough material. The chippings

of the quarries after reduction to their pristine granules are incorporated with a binding material in almost fluid form. Thus the pasty liquid is run into moulds and speedily converted by the application of some 2,000 tons of hydraulic pressure into a solid flag or landing or step as the case may be. From thence the newly-created mass passes to the drying grounds. Fourteen acres are occupied by stacks of maturing flags, which are shipped only after some eight or twelve months of storage. By that time the material is perfectly responsive to the chisel. Angles, curves and holes of all dimensions are readily shaped, as the deputation was assured by ocular evidence.

The Nonslip Works were doubled in capacity not long ago, and further extensions are in contemplation. Other estates and works of Messrs. Brookes, Ltd., were pointed out from the contiguous hills, including their important tannery and their remote "delfs."

A SITE has been secured in Park Road, Crouch End, on which to erect the proposed Coronation Memorial cottage-hospital, and efforts are being made to proceed with its erection at once.

THE Manchester Corporation have decided to widen the streets which surround the site of the proposed new infirmary. In Piccadilly itself the pavement will be carried back opposite to the Queen Victoria memorial statue, and also opposite to the Peel and the Wellington statues. This will give a straight line of thoroughfare along Piccadilly, making the whole roadway 56½ yards wide at the Market Street end and 47½ yards wide at the London Road end. There will be a considerable widening of Portland Street. At the junction of this street with Piccadilly its present width is 30 yards. It will be made 7 yards wider. Near Parker Street, Portland Street is a little over 30 yards wide. Its width will there be extended to 30 yards 2 feet. Parker Street, at the rear of the infirmary, is 12 yards wide. The proposed new building line will carry the roadway right back to the present infirmary building, and eventually in parts even further. In the place of a street 12 yards wide as now, the city will have a street 26 yards wide. George Street is now 16 yards in width. Like Parker Street, it will be widened to extend to an open street of 26 yards.

THE "TRIDENT" COOKING RANGE.

MESSRS. WM. GREEN & CO., LTD., of Ecclesfield, near Sheffield, have just placed this new range upon the market, which possesses several improvements on the usual combined

cooking range, and has already met with considerable success. One of the most important is that when used as an open fire

the whole top and front of the fire is quite clear and fully exposed, there being no solid fall-bar at the top of the front bars, which are lowered or raised as an open or closed fire is required, and also lift entirely out, giving free access to back boiler for cleaning out flue. The flue is an iron-cased one, effecting a saving in the brickwork. The open fire is easily regulated, and can be made large or small by the lifting bottom, which is held in position by the socket in which the lifter is inserted, engaging with teeth on the side frame, one hand only being required to operate it. The fire door is attached to the sliding cover, and when an open fire is desired turns on to the sliding cover and is pushed back with it.

Section 1 shows a roasting fire, with the sliding fire cover and fire door pushed right back, the bottom grate lowered and the front bars raised to their highest position.

Section 2 illustrates the open fire with front bars and bottom at medium height, and exposing the whole of the front and upper surface of the fire. This range is a perfect cooker, as the heat is carried round under and over both ovens before entering the flue. It is to be exhibited at the stand of Messrs. Wm. Green & Co., Ltd., at the Ironmongers' Exhibition, Agricultural Hall, from the 17th to 28th inst., where it can be seen in operation.

ACCORDING to an official of the Corcoran Art Gallery, Washington, there have been within the last week conferences between a trustee of the gallery and Mr. J. Pierpont Morgan, who has offered to transfer his valuable private collection of paintings, valued at 6,000,000 dollars, to the proposed National Gallery, in the event of its establishment. The plans now are to have a Bill creating the National Gallery introduced at the next session of Congress by a New York member, who will accompany the project with a voluntary offer of 1,000,000 dollars for the maintenance of the institution.

At a special meeting of the Elgin, N.B., Burgh School Board, a communication was submitted from the Education Department approving of extensive alterations in the East and West end schools, subject to minor changes. The changes were given effect to and the plans returned to the Department. The alterations involve an expenditure of 6,600l., and the abolition of the girls' school, which has been in existence for over fifty years.

DURESCO

THE IMPROVED WATER PAINT.

For the Treatment of Walls and Ceilings, either for Plain Work or Artistic Decoration.

Dries Flat and is not Absorbent like Common Distemper.

SEE BOOK OF 28 DESIGNS, by W. J. PEARCE, PRICE 2/6, POST PAID.

PETRIFYING LIQUID, THE STONE PRESERVATIVE.

This Material has now been extensively used for over Sixteen Years for Arresting Decay in Porous Stone and Brick Buildings, Monuments, &c.

CHARLTON WHITE (ZINC) OIL PAINT

NON-POISONOUS. CHEAPER THAN WHITE LEAD.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

ELECTRIC LIGHTING OF BRIGHTON.

THE lighting committee of the Brighton Town Council have received a report from Mr. Arthur Wright, the consulting engineer and manager, with reference to the tenders for the Southwick and North Road electrical plant. The three following firms, he stated, sent in complete tenders, complying in all respects with the conditions of his specification:—The British Westinghouse Company offered to carry out the work for the sum of 79,846*l.*, and an addition of 58*o*l. for electrically-driven condensers; Messrs. Witting Bros. & Eborall for 88,000*l.*, and the General Electric Company for 96,213*l.* After thoroughly examining all the propositions received, Mr. Wright was of opinion that the equipment offered by the British Westinghouse Company is as complete as that offered by any other firm, and, having inspected their facilities for manufacturing the whole of the apparatus at their Manchester works, he recommended the Council to accept their tender, subject to a complete set of working drawings being submitted by them for his approval, and the contract signed before August 31 next. The committee resolved that the tender of the British Westinghouse Electric and Manufacturing Company, Ltd., to supply and erect the generating plant at the Southwick power station, together with switchboards, instruments, &c., at the North Road power station, and to maintain the same for a period of twelve months from the erection thereof for the sum of 79,846*l.*, with an addition of 58*o*l. for electrically-driven condensers, be accepted, subject to the conditions named by Mr. Wright.

ELECTRICITY AT ASTON.

THE electricity-generating station in Chester Street, Aston, the erection of which was commenced about a year ago, is now nearing completion. The undertaking is a large one, for electricity is to be generated not only for the purpose of lighting, but also for tramways. The station has cost, with the expense of the cables, 65,000*l.* The building, which adjoins the local fire station in Chester Street, and consists of an engine-room 70 feet by 40 feet, a boiler-house 70 feet by 36 feet, a shop for repairs, and with a chimney-stack 160 feet in height, has been practically finished for some few weeks. It is being equipped with machinery of the most up-to-date type. There are two 500-kilowatt engines, one 250-kilowatt engine and six boilers. The latter are fitted with mechanical stokers, and a wonderful

labour-saving device for unloading coal from the canal, carrying it to the top of the boiler-house and dropping it down automatically. It also carries the ashes back to the canal. Up to the present there has been laid about ten miles of cables for lighting purposes along the following thoroughfares in the district:—Aston Road North, Lichfield Road, High Street, Birchfield Road, Lozells Road, Witton Road, Albert Road, Victoria Road, Park Road, Church Lane, Church Road, Vicarage Road and Trinity Road. Experts who were consulted before the undertaking was commenced expressed the view that Aston is in a peculiar position to make electric lighting a success, one factor being that the district has no local gas undertaking to compete against the more advanced light of the district. The committee have decided to charge 6*d.* per unit between the hours of five and seven at night in winter, and from seven to nine in the summer, and during the remainder of the day 1½*d.* per unit, charges which for cheapness compare well with other towns. As to public lighting, it was originally proposed to erect 100 arc lamps in the principal parts of the manor, and in the laying of the cables provision has been made for this number. Instead, however, of proceeding with the whole of these immediately, the committee have decided to place for the present fifteen arc lamps at Six Ways and Aston Cross, Lichfield Road, by way of experiment.

CONTROL OF HOUSE DRAINS.

A PAPER on "The Dual Control of House Drains: Is it Effectual?" was read by Mr. W. J. Addiscott, sanitary inspector, Plymouth, at the Conference of Sanitary Inspectors at Bradford. It was said that the interest awakened in the public mind, due to the holding of conferences and the spread of sanitary literature, is such that when illness of a serious nature occurs in a family by reason of defective drains, the question arises, "Who is responsible?" He considered that one department, and one only, should be responsible, and that the Health Department. Under dual control the Surveyor's Department is responsible until the house is completed or in occupation for the first time. Immediately the house becomes occupied responsibility passes from them to the Health Department. By this method of dual control responsibility for defects can be shifted from one department to another. The surveyor should have full control up to the house connection, manhole or intercepting trap; from this point all control and

responsibility should rest with the Health Department, the inspector being responsible to his committee for the soundness of the drains, soil-pipes and fittings connected therewith, thus extending to new buildings the same principle that applies to old premises. There is no branch of "domestic sanitary work" that a fully trained sanitary inspector is not qualified or capable of pronouncing a judgment on equally with an engineer. This argument is supported by all local authorities in their placing the supervision of all sanitary work of occupied houses, whether it be a cottage or mansion, under their control. Again new premises, the sanitary work of which has just been supervised by an expert engineer or the Surveyor's Department, has become occupied, and immediately, if the owner so wishes, he calls in the sanitary inspector from another department, who is then in a position to advise alterations or extensions of the sanitary fittings. This causes unnecessary expense, loss of confidence on the part of the public in the municipal authorities and possible friction between two well-meaning departments. If one department was responsible for all house drains in new as well as old premises in all stages of construction, then greater confidence would prevail on the part of the public, they knowing that for all purposes connected with house drains the internal sanitary fittings of their homes were from the start to finish under the control of the Health Department as the right and proper sphere for its labour.

KINGSTON-ON-THAMES ELECTRIC-LIGHT INQUIRY.

COL. W. R. SLACKE, R.E., Local Government Board inspector, held an inquiry at the Kingston town hall on the 1st inst. in respect to the application of the Town Council for sanction to borrow 7,784*l.* for purposes of their electric-light undertaking.

The Town Clerk, after giving the usual statistics as to population and assessable value, said the Local Government Board had sanctioned three loans for the electric-light undertaking, viz. in October, 1899, 15,000*l.*; in March, 1901, 15,000*l.*; and on the same date, 2,800*l.*; total, 32,800*l.* It was in regard to what had been done in respect to those items sanctioned by the Local Government Board that the present inquiry was being held. The total expenditure had amounted to 40,584*l.*, including a small item of 317*l.* additional work, which was absolutely necessary. After certain savings, the net excess was 7,781*l.* That application was merely in respect to the

additional expenditure found necessary in connection with the series of loans he had referred to. It was a fact that the Corporation, in due course, on the advice of Mr. Burstall, who had been consulted specifically on those matters, would have to apply to the Local Government Board for certain capital expenditure, the amount of which it was impossible to state, for extension of the undertaking and for meeting certain requirements that had come up. Their application that day was for one branch, and he wished to make it clear that they might in the future apply for some more money.

Col. Slacke observed that it was much better to have the works commenced finished before starting any more.

Mr. Winsor said, to avoid that, they thought it was best to start afresh before going on with the new work. He presented a summary showing the excess expenditure on the various items as follows:—Buildings (including shaft, &c.), 1,448*l.*; machinery (exclusive of street machinery), 1,714*l.*; street machinery, 39*l.*; street lighting (cables and lamps), 178*l.*; other mains, &c., for distribution purposes, 1,836*l.*; consumers' cables, 2,124*l.*; and miscellaneous items, 445*l.*

Councillor Francis (vice chairman of the committee) said he had been through the accounts, and he was satisfied that the excess of the original loans was necessary.

The Inspector said that the evidence would be of a purely technical character, as he had disposed of the principle of the thing.

Mr. Edgcome, the electrical engineer, then gave evidence. He said the works started to supply light in October 1893. The number of lamps connected during the last year was 25,767 8 candle-power, exclusive of street lighting, now it was 26,438. The charge at present was 6*d.* per unit for the first two hours, and 4*d.* afterwards for lighting; for power 3*d.* per unit up to 5,000, and between 5,000 and 10,000 2½*d.*, and above 10,000 2*d.* An alteration had recently been made, and would take effect next January, when it would be 7*d.* per unit, and then 3*d.* The number of consumers was 548. In respect to street lighting, the cost worked out at a fraction under 2*d.* a unit on the old plan of using the arc lamps, seventy-six in number, all night; now side lights had been fitted, and at 12.30 A.M. these were used instead of the arc lamps. For each lamp they received 20*l.*, and he anticipated that the side lights would bring the price per unit up to about 2½*d.* During the last three years there had been a marked improvement in the undertaking.

Further evidence of a technical character was given by Major Macaulay, and the inquiry then terminated.

The Architect.

THE WEEK.

ON August 4 the members of the Royal Societies of Antiquaries of Ireland will visit Youghal, where a meeting will be held and the remains that have survived will be visited. The name means the "yew wood." Before the English invasion it was a settlement of the Vikings. But what is most interesting in the town is the house of a man who embodied the Viking spirit, viz. Sir WALTER RALEIGH. The house was not, it is believed, erected for him. It is supposed he obtained it at the same time as his large estate of 42,000 acres. SPENSER, the poet, testifies to his visits, but the royal favourite was too busy and adventurous to be satisfied with the dull existence of a remote Irish town. As happened with many other absentee landlords, his estates were badly managed, and he was glad to sell them to Sir RICHARD BOYLE. According to tradition, he first planted the potato in Ireland, and "Father PROUT" has descanted on the ingratitude of the Irish in failing to erect a memorial of their benefactor, although of late years the value of the esculent has been doubted. On other days there will be excursions to Rhincrew Preceptory, which belonged to the Knights Templars, Temple Michel, the Abbey of Molana, and finally Lismore Castle, the seat of the Duke of DEVONSHIRE, on the banks of the river Blackwater. For a four days' excursion the district is especially suited.

ONE of the most remarkable of the mosaics found in Pompeii is one which is believed to represent the *Battle of Issos*. Professor QUARANTA, who was the first to describe it, asserted that MICHEL ANGELO and RAPHAEL might have been proud of the dying horseman in it, as well as ALEXANDER's Bucephalus. The horses of the quadriga, the others that lie on the ground wounded, and especially one rearing and foreshortened, all are shown with a boldness and truth in their motions and positions which modern painters might envy. In another place he declared that even the finest of RAPHAEL's heads will scarcely bear comparison with those of DARIUS and some of the Persians. The subject was recently treated by Dr. PERNICE of the Berlin Museum. He says that ALEXANDER is represented as having just slain AXATHRES, the king's brother, and is about to kill DARIUS himself. He suggested that a similar painting must have existed as lately as the Renaissance period, and was the source of inspiration for many Scripture pieces. The question of authorship cannot be settled. There were two contemporaries of ALEXANDER THE GREAT who were competent to undertake the original masterpiece from which the mosaic was derived. One was a woman named HELENA, whose works were carefully preserved for many years, and, indeed, a *Battle of Issos* by her was reverently placed in the Roman Temple of Peace by the Emperor VESPASIAN, who had acquired it in an expedition. There was also the painter APELLES, the friend of ALEXANDER, and from the traditions about his ability which have come to us it may be assumed that he would be equal to the task of producing so vigorous a work.

"WHAT great events from little causes spring" is a common exclamation, and it was exemplified in the case of a picture-dealer on a small scale who was brought before the Courts of Paris some time ago. He was charged with selling some designs which were ascribed to HENRI PILLE, and on inquiry it was discovered that was not his first offence of the same kind. Even the humblest class of picture-dealers cannot help being verbose, and it was through M. ELLINA's loquacity that the system of falsification—of which the notorious tiara in the Louvre was one of the products—was first revealed to the public. The manufacture of works of art was proved to be international, and the whole extent of the agency has yet to be investigated.

It was, however, demonstrated beyond doubt that the tiara, or at least the greater part of it, was made by a poor metal-worker in the east of Europe. Attention was concentrated on that work, and eventually it was shown that M. ELLINA's statements were correct. The tiara having become an example of the waste of public money, judicial attention was again directed to the unlucky vendor of the so-called drawings by PILLE. He has been fined 100 francs. The young artist who performed the work, another picture-dealer and a woman who aided the vendor have been fined in sums from 25 to 50 francs. Considering the services which M. ELLINA has rendered, not only to France but to other countries, in exposing the incompetency of museum officials, he ought to have escaped without punishment.

THE inauguration of the new buildings of the Bibliothèque Nationale in Paris will enable the public to view one of the most interesting exhibitions ever held in the city. M. PASCAL, the architect, has made a restoration of the ancient "Cabinet du Roi," which PETER THE GREAT considered the most beautiful marvel among the interiors he had seen in Europe. He was not perhaps a good critic of anything relating to art, but at least his judgment was not led astray by false theories. The restored room might well serve for the reception of kings, princes and statesmen. The French Government have resolved to use it for a display of works of art in various forms belonging to the period of the VALOIS. The reign of that family began in 1328. CHARLES V. was one representative, FRANCIS I. another, and there were HENRY II., HENRY III., HENRY IV., LOUIS XIII., and LOUIS XIV. In the museums of Paris and the provinces many remarkable works are to be found dating from that long period. A selection from them has taken place. In addition several collectors in France and other countries have acceded to the request of the French Government, and it will be found that among the pictures, illuminated manuscripts and other objects there will not be one inferior specimen.

THE rumours about the irremediable condition of the site of the Campanile of St. Mark, Venice, do not appear to be exaggerated. The correspondent of the *Scotsman*, who, since the collapse of the structure has been able to obtain accurate information on all points relating to the proposed works, says it was taken for granted that the old foundations continued to be stable throughout their depth. They are visible, and he says:—"The sight is not a little surprising." The lower courses are found to be of smaller and unhewn stones, not too carefully laid, and apparently thrown down in hot haste to keep out the water. They are of Istrian sandstone, liable to absorb water and to disintegrate. Common lime mixed with sea-sand was used for mortar. The result is, says the correspondent, that the salt water has percolated through and through all the foundations of the campanile, below the level of high-water mark, which is the level of the Piazza, and has disintegrated the mortar and washed it out. As the tide falls in the lagoons the water trickles all through amongst the foundation-stones, running in little streams in places. Again, the foundations of the campanile have a list towards the Doge's Palace. This at the level of the pavement of the Piazza is nine centimetres, or $3\frac{1}{2}$ inches, which is not much, but as the tower ascends, it would amount to a great deal. Once more, hydraulic lime will not attach itself to ordinary mortar. There would be difficulty in uniting the old with the new. Lastly, the foundations are split from top to bottom where the door of the campanile was. The architects, engineers and builders are said to consider it would be madness to build on foundations which have served for a thousand years. The correspondent concludes by saying:—"Now is the time to agitate for the rebuilding of an artistic campanile on another site, and leave the Piazza of St. Mark, the drawing-room of Venice, free in all its amplitude of beauty as it is to-day."

JAMES WHISTLER.

WHEN JAMES WHISTLER painted his harmony in black and grey of THOMAS CARLYLE, it is to be regretted that an arrangement like that prevailing among artists was not adopted. CARLYLE in return should have given us a study in words of his portraitist. In the picture which is now in the Glasgow Gallery, we observe the scorn of shams as he then appeared, when in his comfortable and well-brushed garments he might be taken for a retired parson. Painting could not suggest the strange figure which used to be seen a few years earlier walking in Chelsea or mounted on a steed manifesting amateur grooming. Literary art is more powerful; it can look before and after, and a sketch by CARLYLE would have suggested to us the versatile personality, the fantastic mortal who was to many no more than a charlatan, but who was admired by friends for his genuineness as an artist and as a man. During many years JAMES WHISTLER was put under the microscope by critics and others professing to be faithful interpreters of humanity. Immediately after his death every journal attempted to give a representation of him. The contrarieties found in the judgments are a testimony to the different appearances he presented when looked at from various points of view. Half playfully, half seriously, he adopted the figure of a butterfly, as if it were a crest duly assigned by a herald who considered it most appropriate to the artist's character. He flew from subject to subject with the lightness of his symbol; he never could be said to have exhausted any of them in an academical sense, but he drew from each whatever he thought would best answer his purpose. There seemed to be no more labour in his efforts than the butterfly displays, and no more foresight, but the products were peculiar to himself, for we may say he had no predecessor and has left no successor.

His capricious manner caused him to be misunderstood. Some young artists in this country out of mere wantonness assume for a time a Bohemian manner, but the English people wish to see their future Academicians appearing as responsible men, paying their way, living decorously and qualifying themselves to be accepted as bail, or for the duties of a special jurymen. WHISTLER from the time he came among us was mercurial, nay, as elusive as PUCK himself. His strokes might be considered dainty and his arrangement of colours novel, but what signified those qualities if they were without endurance? What could so whimsical a fellow care about the effects of time? By calling his pictures nocturnes and symphonies he himself suggested they were as fleeting as sounds. He knew he was the victim of prejudice, and his sensitiveness to RUSKIN's clumsy libel about his flinging a pot of paint in the public's face touched him to the quick, not so much for the keenness of the stroke, for WHISTLER could take as well as give, but because he felt that RUSKIN degraded himself to be the mercenary of WHISTLER's opponents. It was therefore not the downfall of RUSKIN he sought when he undertook his action, but his own vindication, and the verdict of the jury, which was inspired by a Bæotian attorney-general and a valetudinarian judge, made him believe that he was incomprehensible in England, and that it would be wiser to seek patronage elsewhere.

There were numerous people who rejoiced at his defeat. Dr. JOHNSON excused his sarcasms on GARRICK by saying, "PUNCH has no nerves," and many of the quidnuncs who flit from studio to studio made simple people believe that WHISTLER was a man who not only wounded but dropped vitriol into the wounds he made. He could be witty and epigrammatic, and his remarks were usually happy. He enjoyed his own repartees and had a childish vanity in repeating them. But no one more carefully avoided the utterance of a word that might give pain to those he respected. He was kindly at heart. No men are more considerate than artists, and WHISTLER was not an exception. If he could not relieve the distresses of applicants, he endeavoured to serve them in other ways. But to pretension of every kind he did not conceal his enmity. Those who knew him would, we are sure, bear out our description, and those judging his character simply from hearsay will do well to remember he was no MEPHISTOPHELES, but rather an innovator amidst unfavourable surroundings.

It was also brought against him, especially during late years, that he was supposed to make a bad return for the kindnesses he received. His action in the Paris law courts against Sir WILLIAM EDEN, although successful in a technical sense, involved him in costs, and was assumed to be an endeavour to extort money. A man who is ungrateful is sometimes deemed to have committed the greatest of crimes, and a patron in art often considers himself as a person who confers great favours, while he receives only paltry returns. WHISTLER's works were valuable, and he was justified in insisting on a proper sum being paid for them. Because his name was not found on the list of Academicians it was inequitable to expect him to receive with meekness a third or a sixth of their prices. He is charged with having painted a portrait of Mr. LEYLAND in the character of a demon. Revenge of that kind is not unknown among artists; MICHEL ANGELO himself could not resist it. But we doubt if such a portrait exists. We have never seen it, nor are we acquainted with any of the artist's confidants who have. What we believe gave rise to the report is, that in the Peacock-room in Mr. LEYLAND's house we see one bird, who is in a state of excitement, ready to tear another bird, who appears to be calm and prepared for the contest, and WHISTLER made no secret that the two were intended to suggest the financial relations between the millionaire and the dissatisfied decorator. It was generally believed that the novel work was obtained at a price which did not correspond with the labour expended on what was probably the most original example of decoration produced in the nineteenth century.

WHISTLER was supposed to produce his pictures with so much speed, a buyer would maintain he had no claim to expect remuneration on a scale similar to that paid for works which were "solidly painted." It used to be a joke among the artist's friends, and which he himself enjoyed, to say his house was taken for the dyeing branch of a laundry, on account of the number of paintings hung on lines to dry. When exhibition times approached there was an expedition in the studio which afforded grounds for the story. But it should not be forgotten that WHISTLER avoided that painting-in and painting-out method until the right colour is arrived at by accident. Before he touched the canvas he had a definite idea of what he was to accomplish—not only each stroke by itself, but in its relation to the other strokes. Indeed, it is to be regretted that with so peculiar a skill he was unable to take part in fresco-painting. It must, however, be allowed that, in spite of the facility with which his paintings and drawings were produced, they have stood the test of time. They are also likely to survive, because there can be no chemical action going on between a series of layers of paints.

He rejoiced in colour, and his English and South American firework scenes were daring efforts, from which he received a pleasure. His pseudo-Japanesque figures were also delightful to him. But the portrait of *Carlyle* and the *Portrait of the Painter's Mother*, which was purchased by the French Government, his *Sarasate* and several others show how well he could manipulate sombre black, especially when he had an opportunity of contrasting materials of various textures. Indeed, his portraits, whatever may be the colour, are of extreme simplicity; but the last of them was as much subjected to censure as the powerful figure of the girl at the piano, which startled visitors from its elevated position in the Royal Academy between forty and fifty years ago. It will be admitted that his contributions to the Grosvenor Gallery helped to give character to that noble experiment. They demonstrated that the Royal Academy did not comprise on its walls all that was elevated in painting. Other artists took courage from WHISTLER and dared to be original in different degrees. When, to the surprise of many, he was elected President of the Society of British Artists, he endeavoured to alter the dead level which of recent years marks a gallery which is reputed to be a nursery of British painting. For a year or two there was a sign of movement, but the efforts required too much energy from the members, and once more lethargy prevailed in Sussex Street, apparently for ever. Of late WHISTLER made another attempt to foster individuality in the exhibitions of the International Society, and the success attained was mainly due to the foreigners co-operating with him.

In the majority of his works, and more particularly in the harmonies and nocturnes, WHISTLER demonstrated the superiority of treatment over subject. He could make a picture out of anything, and the simplest object became expressive in his hands. That quality made him an incomparable etcher. He had acquired the art in Paris, and his earliest examples are still prized. He was not, like MERVON, at war with the world and with a tendency towards the sombre. WHISTLER enjoyed life, and as BURNS and BÉRANGER were inspired to lyricism by commonplace matters, WHISTLER made any form delightful which admitted of light and shade. The etching-needle enabled him to portray the mood of the moment, and he could rejoice in the gloomiest parts of the Thames as well as amidst the architecture of Venice. There are no tricks in his plates. He never attempts to rival photography in details. But he conveys to us most emphatically the impression made by the object or the scene on himself. Yet amidst the variety it can hardly be said with the same force as of other men that he had any specialty. Love of light and shade attracted him to wharves and wooden bridges, riverside warehouses and dingy shops in Chelsea. But among his 300 etchings there are scenes of all kinds. A few years ago he was tempted to make drawings on transfer paper, but, as we said at the time, although they showed dexterity it was not possible with the material to produce anything which would correspond with the plates of GÉRICAUT, DELACROIX, RAFFET, DAUMIER, CHARLET, DECAMPS, &c., who boldly drew on the stone.

The views in the etchings do not correspond with what used to be known as "topographical drawings," which undoubtedly exercised much effect on water-colour art. The latter were produced by men who appeared to be entirely unmoved in the presence of nature or art. The utmost praise we can give them is that they were conscientious. The drawings were useful in bringing scenes before stay-at-home travellers. In that way they showed their relationship to the majority of English pictures, which are expected to have an utilitarian purpose, to teach history or geology or morals. BÉRANGER considered "l'art sans application est un enfantillage," and many English amateurs agree with the song-writer. WHISTLER'S aim was less exalted. He sought to show appearances which to his eyes were beautiful, and was satisfied if the spectators agreed with him and began to see silver and gold where formerly only muddy water was visible. As a rule, we believe the majority found it more easy to believe in the transformation of natural scenes than in such artificial glories as his scenes of illumination and firework displays. There was, however, a subtle suggestion of evanescence in all he produced. They are commentaries on the words of PROSPERO about the great globe and its inheritors being only an unsubstantial pageant. Most of his portraits are suggestive of ghosts, while his nocturnes and symphonies seem records of transient aspects which can never be recalled.

WHISTLER was an American by birth. His ancestors were English, but he used sometimes say there was an Irish strain in his blood, and in many things he was more Celtic than Saxon. He was not much disposed to talk about his youth. But as his father acted as a railway engineer in Russia he lived for a time in that country. He returned to America to be trained as a military engineer. There was a curious precision occasionally exhibited in his drawing and painting which suggested an early teaching that science was measurement, and it was the more remarkable when contrasted with the final results, which suggested influence of a different sort. He abandoned soldiering for art, and studied under GLEYRE. In England he was friendly with DANTE ROSSETTI. He married the widow of EDWARD GODWIN, who was a daughter of BIRNIE PHILIP, the sculptor, and was, moreover, a clever water-colour artist. GODWIN, whom WHISTLER admired, designed a house for him in Chelsea. Although neurotic and belligerent he nearly attained his seventieth year. After life's ferment he now sleeps in the same ground with HOGARTH, who also fought the battle of individuality.

A LEITH COMPETITION.

SEVERAL circumstances have lately arisen which indicate the failure of architectural competition as a system. It is satisfactory neither to promoters nor to architects. The cathedral case in Liverpool was only an indication on a very large scale of the prevailing feeling. Fortunately the executive committee, on reflection, changed their resolve. Like true men of business they accepted the judgment of the experts to whom they had confided their interests. If Mr. SCOTT'S design had been rejected a grievous blow would be struck against the principle of competition.

It may be allowed that committees and public bodies find it inconvenient to see designs which they prefer seemingly undervalued by the assessor. But they ought to have announced that, although an assessor would be called in, his decision was not binding on the promoters, and that his selected design, as well as all the designs, could be set aside. That would correspond with the intimation which used to wind up invitations to builders, and which announced that "the lowest or any of the tenders will not be necessarily accepted." Respectable contractors began to decline such invitations, and there is no reason to imagine that architects would care to contribute plans if they were aware of the uncertainty of meeting with fair play.

An example of the spirit now re-arising is afforded by the competition for a workhouse at Leith. The first intention was to ask a local architect to prepare a design, and there would be no objection to that course. But a majority of the Parish Council came to the conclusion that in the ratepayers' interests it would be preferable to hold a competition. As Leith may now be considered to be a part of Edinburgh it was not necessary to go far to find competitors. In Edinburgh there is no society that can be said to represent practising architects, and when the Edinburgh Architectural Association offered suggestions these were rejected, probably in the belief that the members were only students or apprentices. The Council in their instructions enjoined that "the plans must provide for a poorhouse, well finished and complete in every respect, planned on the latest and most approved principles, and equipped with all the latest sanitary and other appliances for the efficient working thereof." The command was excellent, but the result will show it was only a blind.

On February 25 the chairman was able to announce that eight sets of plans were sent in. In order that they might be exhibited it was agreed to hire a room for two or three weeks at a rent of 20s., and to employ joiners to set up screens to carry the drawings. Some of the members wished to retain the power of dealing with the collection, but a majority were in favour of appointing an assessor, on the condition that no architect practising in Edinburgh or Leith was eligible. On March 17 it was decided to engage Mr. R. D. SANDILANDS, of Glasgow, as assessor, his fee being fifty guineas, and Mr. DAVID REID, of Edinburgh, as measurer, at a fee of six guineas. On April 29 Mr. SANDILANDS informed the Council that before he examined any of the designs he had visited the site and then considered the adaptability of each design to it. Out of the eight before him he selected those numbered 2, 3, 4 and 7, and asked the measurer for estimates of their probable cost. The amounts he received were the following:—No. 2, 92,939l.; No. 3, 71,607l.; No. 4, 75,540l.; No. 7, 84,712l.

The variations in cost were explained to be mainly due to the amount of accommodation. In No. 3 merely the minimum space was allowed, and would require to be enlarged, while in No. 2 excess space was provided which could be reduced. Finally the assessor said:—"In my opinion No. 2 is entitled to first place, No. 7 to second, No. 3 to third and No. 4 to fourth. The first (No. 2) commends itself to me for its grasp of the essential features of poorhouse and hospital construction and requirements. While architecturally it is very plain, the excellent arrangement of the plan and the way that every department is cross-ventilated seems to me to outweigh all other considerations. As I before mentioned, the extra cost is mainly due to the extra accommodation provided, and could be greatly reduced if brought down to the same dimensions as the others."

The committee did not at once adopt Mr. SANDI-

An Exhibition of Posters will be opened in the White-chapel Art Gallery on the 30th inst. It will contain foreign as well as British examples.

LAND'S recommendations. They found that the majority of the plans were on the pavilion system, whilst they maintained that when they said the new poorhouse was to be planned on the latest and most approved principles, what they wished to convey was that the block system was the one they had in view. Now the block system is considered everywhere except in Leith to be an obsolete arrangement. The Council, however, wrote to Mr. SANDILANDS, asking him whether three of the four plans he selected, including the first, could be held to conform with the prescribed conditions. We suppose it was their endeavour to have the design recommended as well as two others set aside on the ground of informality. Mr. SANDILANDS in his reply showed he possessed the judicial spirit, for he wrote:—"I see nothing in the conditions of competition to lead any competitor to the conclusion that the Council desired the corridor system to be adopted. On the contrary, the top note states that the poorhouse is to be planned on latest and most approved principles. This, in my opinion, points to the pavilion system. If the Council considers that the corridor system will suit its purpose best, then there is no doubt design No. 7 is the most suitable. I will even go further by stating that if the Council put the corridor and pavilion systems on an equal footing, I would say No. 7 is the best. But as I consider the pavilion system much superior to the other, I placed No. 2 first." If an assessor is not to be allowed to be guided by principles derived from his own experience, and if he is to be only an exponent of the opinions of a section among the promoters of a competition, his office is nothing but a sham, and it would be better to let it be known that what is desired is not a design which exemplifies the most modern ideas, but rather one which will gratify the whims of an untrained majority.

The committee then requested him to express an opinion on the four remaining plans. He stated he had considered them to be inferior as compared with the others. In the course of his remarks on No. 6, which eventually was selected, he pointed out that the wards in this design were badly ventilated, and that the cost, which was given at 52,000*l.*, was insufficient. The committee awarded the 100*l.* premium to design No. 2, by Messrs. SCOTT & CAMPBELL, of Edinburgh, and the 50*l.* premium to No. 7, by Mr. W. C. LAIDLAW, of Edinburgh. Here may be said to have ended the first act of the comedy.

The proceedings of the Leith Parish Council, although conducted in private, quickly find their way by means of reports in the newspapers to the public. On account of the rumours that their design was considered too expensive, Messrs. SCOTT & CAMPBELL wrote to the Council explaining how reductions could take place. Their aim was, they said, to provide a well arranged and convenient plan at such a cost as might be reduced, but not exceeded. Mr. LAIDLAW also wrote stating that his estimate of cost was 66,465*l.* and not 84,712*l.*, as stated by the measurer. As the cubic capacity in the day-rooms, dormitories and wards was in excess of the requirements of the Local Government Board, it would be possible to have reductions without altering the plan or affecting the appearance of the buildings.

The next step on the part of the Council was to decide on the adoption of the corridor arrangement. That signified the rejection of Messrs. SCOTT & CAMPBELL'S design. A proposal to call in a new expert was carried, but was not acted on. Then it was boldly resolved to select plan No. 6, on the condition that it was to be subject to such modifications or otherwise as might afterwards be determined. One of the members pointed out that the designer of No. 6 had estimated the cost as 44,000*l.*, while the measurer appointed by the Council had given it at 68,784*l.* No. 2, the first premiated design, was, according to the architects' estimate, to cost 94,939*l.*, and the measurer made out the amount at 92,939*l.*

Although the names of the competitors who had failed to receive premiums were not published officially, it was mentioned in the local papers that the favoured design was by a local architect, Mr. JOHNSTON. A builder also announced that he had seen plans No. 6 and was prepared to carry them out for 55,000*l.* A difference of 11,000*l.* might be supposed to call for a specialist's examination, but a majority of the Council had evidently resolved that

Mr. J. M. JOHNSTON should be appointed architect, and the end of it was that he received the commission. It was no more than a formal act, for two or three weeks earlier his success had been announced in the journals.

It is quite possible that in No. 6 the Parish Council have the plans for exactly such a poorhouse as was desired. Judging by the cost of similar buildings in Scotland, and calculating at the rate of 175*l.* per bed, a normal building would need 95,000*l.* The buildings at that price may, however, be of a more luxurious kind than is desirable in Leith. Official sanction has to be obtained, and as economy is recommended the selected plans probably will be approved. The questions of cost and suitability are for the people of Leith to determine. We have nothing to do with that part of the subject. It is enough for us to express the wish that the system of competition which has been exemplified in Leith will not find many imitators. If conditions are to be issued which are not precise and which by most people would be interpreted in an opposite sense to that really intended by the promoters; if an assessor's award is to be set aside and if a particular design is to be exalted into an emblem of the spirit of a town in its competition with a city—for Leith and Edinburgh are at war—then, we say, it is useless for architects to take part in contests conducted in that way. The insignificant premiums paid are no compensation for the labour which has been gone through, and for the disappointments which must arise when it is found that some other cause besides consistency and equity is the potent factor in the struggle.

ST. MICHAEL'S COLLEGE, TENBURY.

By J. S. BUMPUS.

(Concluded from last week.)

NO account of St. Michael's College, Tenbury, could be complete without some reference to the life and art work of its founder, whose position as an English Church composer seems to be unique, when the excellence as well as the number of his sacred compositions is borne in mind.

Frederick Arthur Gore Ouseley, son of the Right Hon. Sir Gore Ouseley, G.C.B., F.R.S., was born in Grosvenor Square, August 12, 1825. At his baptism in the church of Hertingfordbury, Herts, the Duke of Wellington and the Duke of York acted as sponsors. Like Mozart, Lord Mornington, Samuel Wesley and Dr. Crotch, extraordinary stories are related of his musical precocity. There is extant, in MS., an opera composed by him when eight years old. He was educated privately at Dorking by the Rev. James Joyce, vicar of the parish, and afterwards as a gentleman commoner at Christ Church, Oxford. He succeeded to the baronetcy in 1844, which, as he died unmarried in 1889, became extinct. He graduated B.A. in 1846, and M.A. in 1849. He was ordained deacon by Bishop Blomfield on Trinity Sunday, 1849, and was licensed to the curacies of St. Paul's, Knightsbridge, and St. Barnabas, Pimlico. The cause of his resignation of these appointments has already been stated. He did not take priest's orders until 1855. In 1851 Sir Frederick Ouseley travelled in Spain, Italy, Germany, Holland and France, and on his return made the Rev. Henry Fyffe's school for the dispersed St. Barnabas choristers at Langley his headquarters, pending the erection of the buildings at Tenbury. In 1855 Bishop Hampden appointed him Precentor of Hereford, and in the same year he succeeded Sir Henry Bishop as Professor of Music in the University of Oxford, where he speedily introduced many much-needed reforms. He had five years previously taken the degree of Bachelor in Music at Oxford, and the year before his succession to the professorship had proceeded Doctor in the same faculty. In 1856, 1862 and 1888 the degree of Mus.D., *honoris causa*, was conferred upon him by the Universities of Durham, Cambridge and Dublin respectively. He received the honorary degree of LL.D. at Cambridge in 1883, and the same at Edinburgh in the following year. On the death of Dr. Jebb in 1886 he received a residentiary's stall in Hereford Cathedral—the only piece of ecclesiastical preferment he ever got—which was but a tardy recognition of the great services he had rendered to the Church. His institution

as warden of St. Michael's College, Tenbury, and first vicar of the parish, had taken place in 1856. While in residence at Hereford, on Saturday, April 6, 1889, he was, during an afternoon walk, seized with an epileptic fit, and died within an hour of the attack. He had long suffered from a weak heart. On the Thursday following he was buried, after a solemn funeral service, under the east window of the church which his munificence had reared, and on this occasion the psalms and anthems spoke of him to the hearts of the mourners as nothing else could. This sad event called forth the subjoined touching stanzas. They are from the pen of the Rev. Dr. Wood, canon of Christ Church, Oxford, vicar of Cropredy, and from 1866 to 1871 warden of Radley College:—

Gone! ere we could again have grasp'd thy hand,
Gone! and no words of parting have been said,
Gone to that Land so near, that silent Land!
Gone by the path we all shall have to tread!

Ah, why so soon, so suddenly remov'd
From friends and noble Art, and work for God!
How much of that sweet Art which thou hast loved
Lies buried with thee 'neath the daisied sod!

Nay, say not so! God's servants serve Him still
In better ways than we could e'er devise;
And who shall say what Angel voices thrill,
What harmonies are heard in Paradise?

Sir Frederick Ouseley was a voluminous composer of Church music. To his facile yet masterly pen we owe some fifteen services and over a hundred anthems, the majority printed, but some still in manuscript. Some of these have orchestral accompaniments. These services and anthems, several of which are in eight real parts, while modelled on the great English Church school, are also worthy of comparison for purity of style and elevation of thought with the works of the old Italian masters, which their composer so much admired and in which he was so learned—Leo, Carissimi, Clari, Colonna, Durante and others of that school. The religious

tone and earnestness of Ouseley's compositions, joined as this is to so much that is modern in style, gives them a devotional character that must be apparent to all who can reflect and can judge. With our parish church choirs his "From the rising of the sun," "How goodly are thy tents," and "Lord, I call upon Thee" are perennial favourites, while those longer and more elaborate compositions, such as "It came even to pass," "Give thanks, O Israel," and "There was a Pure River" are in the service lists of every musically well-ordered cathedral.

To Churchmen, Ouseley is endeared by his tunes to such hymns as "The radiant morn hath passed away," "Thou, Whose Almighty Word," and "They come, God's messengers of love." His two oratorios, "St. Polycarp" (1855) and "Hagar" (1873), though far from being dry, are perhaps too solid and severe in style to ever achieve great popularity, but they are works which will command the respect and, in some aspects, the admiration of musicians.

Amongst Ouseley's more important publications for the Church must be mentioned a collection of his own cathedral music and a volume of rare and hitherto unedited services by early English masters, which, but for his exertions, would perhaps now be practically unknown. Both volumes were printed by Novello in 1853. These were followed in 1861 and 1866 by two volumes of "Anthems for Certain Seasons and Festivals of the Church," to which contributions were made exclusively by living writers, many being by the editor himself. Most of these are now acknowledged classics in our cathedrals. Finally, in 1873, he edited the "Sacred Compositions of Orlando Gibbons," a work involving immense labour and research, as any well-informed Church musician may imagine.

Besides Church music, Ouseley's compositions include voluntaries, sonatas, preludes and fugues for the organ; music for a full orchestra and string quartets; songs, glees, madrigals and part songs. His treatises on harmony, counterpoint, canon and fugue, musical form and composition, published by the Clarendon Press, are valuable contributions to musical litera-

ST. MICHAEL'S COLLEGE, TENBURY. INTERIOR OF THE CHURCH, FROM THE S.W.

ture, and have taken their places as standard works. To Grove's "Dictionary of Music and Musicians" he contributed many learned articles. He read several valuable papers before the Musical Association, of which he became, in 1874, the first President, and as a speaker at several Church Congresses he was always welcomed by reason of his lectures illustrated by musical examples. The same remark applies to the lectures he delivered at Oxford in his capacity of University Professor of Music. Another of Ouseley's literary achievements was his edition of Praeger's translation of Naumann's "History of Music." To that work were added some important chapters on English music from his pen.

A complete list of Ouseley's compositions and works on music was published by the writer of the present sketch in 1892, and incorporated four years later in the "Life" by the Rev. F. W. Joyce, now vicar of Harrow.

Sir Frederick Ouseley, as a musician, was endowed with extraordinary abilities. Like Sir Robert Stewart, his mnemonic powers were astonishing, and his skill in extempore playing upon the organ and pianoforte unequalled. "I know," once remarked Sir Herbert Oakeley, "of very few published fugues for the organ by Englishmen better than some of his improvisations."

Sir Frederick was also an able cellist, he had a considerable gift for mathematics and was an excellent linguist. As a divine, Ouseley was deeply read, and the large collection of theological books in the college library was not brought together merely for show. In the pulpit he was earnest, animated and eloquent. With the attraction of a clear, high-pitched voice, he had an exceptionally clear and logical mind. "This enabled him" (says his biographer) "to make, to a certain extent, deep subjects clear to the simplest people." As a priest he was as active and zealous among the cottage folk of his scattered country parish as he was when a young man in deacon's orders, ministering to the poor in the populous district of St. Barnabas. Having been brought up in his early days in the very highest society in the land, he was a very charming companion. His schoolboys idolised him, as did all who were associated with him in his work. "The most marked feature of his life was the self-sacrifice with which he carried out his plan of building the church and college of St. Michael's. A most loyal and devoted member of the Church of England, he formed the impression, when still a youth, and at a time when not many would have got beyond the idea of taking the pleasures and enjoyments of life as they came, that the skill which had been given him in the art of music might best be made promotive of the glory of God by raising an institution that should provide training in music and give encouragement to its study, as well as to provide illustration of what he conceived to be its best and fullest development as applied to the worship of the Church. . . . There is room for difference of opinion as to the quantity and kind of music with which our Church services, under ordinary circumstances, may be accompanied; but there can be none, amongst churchmen worthy of the name, as to whether we ought not to give the best we can in what we attempt in that respect, and here it is that the example of Ouseley shines as a beacon light amongst the too often sordid imperfections of our offerings."*

At St. Michael's, Sir F. Ouseley formed a musical library of some 3,000 volumes, still regarded as one of the most valuable and exhaustive private collections in the kingdom. Perhaps its greatest treasure is the fine copy of the "Messiah," partly in the handwriting of Handel, and partly in that of his amanuensis, J. Christopher Smith. This, which is known as the Dublin MS, was used by the great composer as a "conducting score" for the first performance of the work, which took place at Dublin on April 13, 1742. The library is rich in printed and manuscript music of the Palestrina and Roman school. There are also many autographs of celebrated composers, and a number of exceedingly rare musical treatises in a variety of languages.

The contents of the library have been fully described in Sir George Grove's "Dictionary of Music and Musicians" (vol. ii. p. 423); by Mr. J. S. Shedlock in the *Monthly Musical*

Record of October 1896, and by the present writer in the *Church Review* of November 10, 1898.

During the closing years of the founder's life, the financial future of St. Michael's College, owing to his reduced income, was a source of considerable anxiety to him. More than once his good friend and neighbour, the Hon. Miss Georgina Rushout, of Burford House—sister-in-law of the present Lady Northwick—who had always taken the deepest interest in the church and college, stepped into the breach and rendered him timely and generous assistance. Eventually, but after Sir Frederick's death, this lady, in 1890, left a legacy of 20,000*l.*, supplementary to the founder's own benefactions and the Ouseley Memorial Fund, and thus the future maintenance of the college, on its original lines, has been assured.

Other instances of Miss Rushout's munificence towards the college may be here adduced, such as the magnificent sacramental plate and altar vestments, the stained-glass windows of the apse, as well as many valuable and extensive additions to the already well-stocked library. When, in 1852, her sister, Miss Harriet Rushout died, she left, among other charitable bequests, 600*l.* towards the foundation then in course of projection by Ouseley at the Old Wood.

Sir Frederick Ouseley was fortunate in having throughout his whole life at St. Michael's the ever-present aid of his friend and his now successor, not only in the wardenship but also in the precentorship of Hereford, the Rev. John Hampton. He, in all practical matters, whether as choirmaster, curate, or sub-warden, proved an invaluable helper. To him, especially, must be attributed not only the splendid choral training of the boys, but also the loving care with which the whole place has been always kept—church, college, churchyard and college grounds alike.

Visitors to St. Michael's will invariably meet with a hearty greeting from the kind and genial Warden, who, if his engagements permit, will be only too happy to conduct them round the buildings and to point out the chief objects of interest.

The photographs have been taken specially for this article by Mr. F. Lowe, St. Michael's, and Mr. C. Davis, Tenbury.

PLANNING LARGE SHOPS.*

IN considering the question of the planning and arrangement of large retail commercial establishments, there are at least four points to be taken into consideration. Firstly, the interests of the proprietor; secondly, the safety and convenience of the customer; thirdly, the local building regulations; and fourthly, the claims of the fire department.

Considering firstly the interests of the proprietor, they may be detailed as follows:—Plenty of window space, plenty of floor and wall space upon which he may erect his counters and fittings, and plenty of light, preferably from the north.

The customer requires ample staircase and elevator accommodation, plenty of gangway space, and easy exit and egress.

The building regulations may require a limited amount of cubical space; therefore the building, if a large one, will have to be divided into compartments, and these shut off from one another by fire-resisting doors.

The fire department claims that any outbreak of fire may be quickly localised, the occupants passed to a place of safety, and that short work be made of any outbreak by reason of its being attacked from more than one point. Also that adjoining premises be not unduly endangered.

This is the problem set the architect in planning and designing a building of this character.

Much, of course, depends upon the site and its disposition, and I feel that any observations I may make would be of more practical importance were I to submit the problem to you in a concrete form rather than discuss it in the abstract.

I shall therefore assume a site with the not unusual accompaniment of a frontage to two streets. The site, for the purposes of this paper, will have a frontage to the respective streets of 70 feet, or 22 metres, and a depth of, say, 200 feet, or 66 metres.

It is also assumed that the building regulations limit the cubic capacity of buildings of this class to 250,000 cubic feet, as in the London regulations. This is done because I feel that dividing a building of this description into compartments is a

* From a sermon preached at St. Mary's Church, Tenbury, by the vicar, the Rev. Prebendary Ayscough Smith, on the Sunday following the funeral of the Rev. Sir F. A. Gore Ouseley, Bart.

* A paper on "The Planning and Arrangement of Large Retail Commercial Establishments," prepared for the International Fire Prevention Congress by Ellis Marsland, district surveyor.

right course, in the same way as it is considered the right principle for a vessel to be divided into water-tight compartments.

It is also assumed that the fire department is efficient, and would be soon upon the scene in the event of an outbreak.

With these conditions in view, we will proceed to deal with our site, upon which I propose to place a building four storeys in height, which would mean some 55 feet from the ground floor to the level of the top of the topmost storey. The cubical contents of such a building would require that it be divided up into three compartments.

The plan and section shown indicate generally the attempted solution of the problem. I have, it will be seen, adopted what may be termed the well and compartment system, and we will proceed to determine how far it meets the requirements of the four points with which I commenced this paper.

The proprietor has, I suggest, ample floor and wall space; his counters, fittings and show-cases can be disposed as he wishes, and the light is provided by means of large lantern lights from the roof, throwing a flood of light down the well on the several floors, in addition to any side lighting that perhaps might be available.

The customers have six ample staircases running from ground floor to roof, with an elevator provided to each. The door openings in the compartment walls are opposite one another and in direct line with the exits into either street. Should an outbreak of fire occur in any compartment the customers on each floor would pass through the doorways and could make a safe exit in either direction.

It is necessary that all the floors and supports be of fire-resisting construction, and all iron and steelwork protected by concrete or hollow tile casing. There being nothing but the contents to burn, the task of the fire department would be a simple one for the following reasons:—That a fire on any floor could be attacked from above and below. The openings in the party walls would be a means of getting readily at the seat of the fire, and at the same time affording a chance of escape in an emergency. The well and lantern would form a shaft for the escape of smoke, and the flat roof would afford access to this from the several staircases. The fire-resisting doors in the openings could with facility be closed, and the fire confined to one compartment.

In a building of this class it would be necessary to provide for receipt and despatch of goods, also for offices and staff accommodation. Any unpacking, packing, or bulk store department, if situated in the basement, should not communicate with the upper part except by lift placed outside the building, enclosed with walls carried up through the roof and covered with a light roof of iron and glass, and the openings on each floor protected with fire-resisting doors.

It is advisable that the offices and counting-houses be in an adjoining annexe, and the dining and sleeping accommodation for the staff placed over and in this annexe, with separate exit and staircase and fire-resisting floors.

The general scheme can, I think, without further explanation, be gathered from the diagram, and I invite the criticism of the meeting to my conclusions.

HOSPITAL CONSTRUCTION.

A PAPER was read at the Liverpool Health Congress by Mr. T. Shelmerdine, the Corporation surveyor, on "Emergency Hospital Construction and Accommodation." His object, he said, was to give his personal views, from an architect's standpoint, of the best manner of meeting an emergency notification from the health authorities of a large city. He presumed that there was an outbreak of an epidemic of a contagious character that had resulted in the ordinary hospital accommodation provided by the municipal authorities being found insufficient to meet the special requirements of the disease, and that an increased number of beds should be provided as rapidly as possible. It was of course taken for granted that the municipality was in possession of administrative accommodation of the ordinary kind. The architect responsible for the carrying out of the work of housing the surplus patients was fully cognisant of the fact that speed, with a due regard for economy, was imperatively necessary. In conjunction with these two important factors, it should be the aim of the architect, and at the same time to carry out his work, so that when completed the interior surroundings would favourably compare with those in a permanent pavilion. Mr. Shelmerdine explained diagrams that illustrated the subject of his paper. Rapidity of construction was the first element for consideration, as every hour was of the greatest importance to the medical authorities in obtaining the necessary emergency accommodation. The life of these buildings was not of course so great as that of a permanent hospital, but having had experience of this class of construction, he found that after thirteen years' wear,

with ordinary care in the matter of maintenance and repairs, the main structure showed very little sign of real wear at the present date, and would appear to have at least a life of thirty years. On the face of it the cost of the wooden structures might seem to be high, but it must be borne in mind that the foundations, drainage, floors and roofs were practically similar to what would be carried out for a permanent building. The comfort and surroundings from a patient's point of view were equally good with those of permanent structures, and, the buildings being of only one storey, the risk of danger in case of fire was reduced to a minimum.

Professor Simpson contributed his views on "Infectious Hospitals and Return Cases." He had certain doubts whether the general hospitals of the present day were the best adapted for the comfort and welfare of the patient. There was no objection to the aggregation of patients in a common building, but that was on a different footing from their aggregation in wards, in each of which there were from twelve to twenty beds. In his opinion there were great drawbacks to this communal life of the sick, the defects of the general ward being the want of privacy and the impossibility of placing the patient under the best mental conditions for recovery. These objections to a large ward system would, he believed, lead to a great change in the new hospitals of the twentieth century, in which common wards would be abolished for the treatment of the sick, and would only be retained for the recreation and meals of convalescents. He was also of opinion that no length of detention in an infectious ward would have any effect on the reduction of return cases. It appeared to him that in future hospitals for infectious diseases the cubicle system was the one to be adopted.

LAMBETH BRIDGE.

THE bridges committee of the London County Council intend to recommend that application should be made to Parliament in the next Session for powers to rebuild Lambeth Bridge. Although certain works for the strengthening of the bridge were carried out in 1888, it still has to be used under restrictive conditions, and, having regard to the increasing traffic, the committee consider the building of a broader and more substantial bridge has now become imperative. In considering the kind of bridge which should be erected in place of the present structure, the committee have had due regard to the position of the bridge in the river.

The question of the gradients practically decides whether it is to be built of steel or masonry. At present the gradients are very steep, being from 1 in 19 to 1 in 22 on the north, and from 1 in 20 to 1 in 23 on the south. Even if the restrictions placed upon the Council with regard to the headways and waterways of Vauxhall Bridge were considerably relaxed in the case of Lambeth Bridge, a masonry structure could not be built with a better gradient than 1 in 25, which is about the same as the northern approach to Southwark Bridge, and which, on account of its steepness, is little used for vehicular traffic going southwards. On the other hand, with a steel bridge a gradient of 1 in 30 can, according to the calculations of the committee, be obtained, and better facilities for navigation afforded during construction than has been the case at the new Vauxhall Bridge.

As the result of a conference between the Thames Conservancy Board and representatives of the river traffic interest, certain conditions as to the rebuilding of the bridge have been imposed, one of which is that the headway of the openings of the temporary works in the two side arches adjacent to the centre arch should not be less than 15 feet above Trinity-high-water mark. This condition, in the opinion of the engineer to the Council, would preclude the construction of a granite or masonry bridge with reasonable gradients. In the circumstances the committee have decided to recommend the construction of a steel bridge, which is to have a width of 60 feet. The estimated gross cost is stated to be 872,000*l.*, of which the cost of the acquisition of property necessary to provide adequate approaches amounts to 410,000*l.* The actual cost of the construction of the bridge is set down at 350,000*l.* The committee urge that it is important that an early decision should be come to in the matter of rebuilding the bridge, as it is necessary, in view of the rebuilding operations connected with the Westminster improvement, that the levels of Horseferry Road and Millbank Street, which form approaches to the bridge, should be fixed.

Herr Bernhard Hertel has been appointed as superintendent of Cologne Cathedral. He has practised as an architect for several years, and in the course of his travels as a student has visited England. As official architect he designed several public buildings, and has lectured on Mediæval architecture in the Berlin Technical High School.

NOTES AND COMMENTS.

THE County Council of London on Tuesday adopted the recommendation of the general purposes committee and the technical education board to contribute 20,000*l.* a year towards Lord ROSEBURY'S scheme whenever land, buildings and equipment for the proposed additional technological teaching and research are provided to a value of not less than 500,000*l.* Among the stipulations are that due provision be made in the scheme to prevent overlapping and secure co-ordination of the work already carried on by the University colleges, polytechnics and other science and technological institutions, and the proper connection of the whole with the University; that a sufficient number of scholarships, including free places, be placed at the disposal of the Council. It is proposed to obtain a site containing 4 acres at South Kensington, on which suitable laboratories and lecture-rooms could be erected for those departments of technology which have yet to be provided for. We have already remarked that the scheme was likely to interfere with some of those already in existence. But as it is not suggested to omit anything which would be independent and complete, the risk of competition has been minimised.

THERE was a time when the city of Paris was without any organisation of its own for the display of works of art. It was then easy to obtain loans of treasures from the Municipality for museums and galleries which belonged to the State. As all visitors are aware, a change has taken place. Paris possesses buildings and collections, and is endeavouring to bring to perfection an art department which will control them. Like men of business, the municipal councillors have ordered an inventory to be prepared, not only of the property which is now in charge of their officers, but of the objects lent to the State. Application has been made for the return of the latter. But the Government collections resemble those of the British Museum, and any object received is not allowed to be withdrawn. Defective works are sent to inferior museums rather than be sold by auction. It seems to be inevitable that the Courts will have to decide the fate of works of art of various classes lent from time to time by the city.

ILLUSTRATIONS.

NEW HOUSE WOKING, SURREY.—FROM SOUTH-WEST. FROM SOUTH-EAST.

THIS house was completed rather more than twelve months ago for Mrs. T. H. WHEELER, and the object was to obtain a small and compact house which should afford the maximum of accommodation without being costly to keep up. It contains three good sitting-rooms and a square hall on the ground floor, with servants' offices all on the same level; five good bedrooms, dressing-room and bathroom on the first floor, and three large attics and two boxrooms on the top floor. The materials are Knap Hill red bricks for the walls, and bright red Surrey tiles for the roofs. The contractors were Messrs. HARRIS & SONS, of Woking, and the architect Mr. H. O. CRESSWELL, of 17 Buckingham Street, Adelphi.

HOUSE, KINLEITH, NEAR EDINBURGH.

CAPITAL AND COUNTIES BANK, REDHILL.

THIS building occupies one of the best sites in the borough of Reigate, at corner of Station and London Road, Redhill. It has recently been completed at a cost of about 5,000*l.* Externally the ground floor is in Hamhill stone, and upper part in warm buff terra-cotta and red bricks, with a wide granite plinth. There is ample banking space on ground floor, large strong-room, manager's-room, lavatories for clerks, &c., with separate entrance and staircase to two floors of offices and caretaker's apartments over. The internal fittings, desks, counters, &c., are in Austrian oak, the walls throughout are plastered in siripite, with an oak panelled dado to bank. The floor of public space is laid with terrazzo and the remainder in wood blocks.

Messrs. TURTLE & APPLETON were the general contractors, and they were well represented on the work by Mr. W. LONG. They also executed all the oakwork. The terra-cotta was supplied by Messrs. EDWARDS, of Ruabon,

the granite by Messrs. FENNING, and Messrs. RATNER supplied the strong-room fittings. Mr. SPENCER W. GRANT, A.R.I.B.A., of 63 Finsbury Pavement, was the architect.

NEW PREMISES, Y.M.C.A., MOUNTPOTTINGER, BELFAST.

THE building plans of the new Young Men's Christian Association consist of three blocks:—Block A, containing the main entrance and six shops to Albertbridge Road, and the minor hall, reading-room and all the offices required in connection with the work. The building will comprise three floors of 126 feet long by about 35 feet wide; block B consisting of the large hall with a frontage to Frank Street; block C contains the gymnasium and offices connected therewith. To give a more detailed description of block A the accommodation is as follows:—Six shops 33 feet long by 16 feet wide, with large open fronts and all requisites for offices or shops. In the centre of the block is the main entrance of the Y.M.C.A., 10 feet wide, leading to a large central vestibule or hall, from which the main departments of the building are reached. To the left the general office and the secretary's office, and in the corner of the hall a fireplace and ingle-nook, which will give a homely character to the entrance and afford a good meeting centre for the members. The main stairs lead off to the left. Behind these are the lobby and entrance to the lavatories and cloak-rooms. At the top is the entrance to the large hall and gymnasium, and to the right the public cloak-room and kitchen offices, and also a bicycle store with entrance from Frank Street. Ascending the stairs we arrive at a large square gallery, with entrance to large hall, and also to the accommodation on the first floor and front block, which comprises:—Minor hall, 54 feet by 33 feet; reading-room, 32 feet by 32 feet; parlour, 32 feet by 32 feet; games room, 20 feet by 16 feet 6 inches. All these will be well lit with bay windows and finished with pitch-pine dadoes. The top floor comprises a central lounge, with seats round, from which access is obtained to the following rooms:—Athletic club-room, 32 feet by 15 feet; camera club-room, with dark-room attached, 33 feet by 11 feet; boys' club-room, 16 feet by 16 feet; cycling club-room, 16 feet by 16 feet; choral society, 20 feet 6 inches by 16 feet; Christian workers' parlour and library, 32 feet by 18 feet; committee-room, 17 feet 6 inches by 12 feet; large classroom, 34 feet by 16 feet; small classroom, 16 feet by 12 feet. Behind the platform accommodation is provided for ante-room, lavatories, cloak-rooms, speakers' room and ladies' room. The site is one of the most commanding in Mountpottinger, being bounded on two sides by the two main arteries of this district. It has a frontage of 137 feet to Albertbridge Road, with a depth of 115 feet. The complete scheme will involve an outlay of about 12,000*l.* Plans have been prepared by Mr. W. J. W. ROOME, M.R.I.A.I. A contract for building has been entered into with Messrs. McLAUGHLIN & HARVEY, of Belfast.

HOUSE NEAR LENHAM, KENT.

THIS house is proposed to be executed in red bricks, and certain portions covered in white rough-cast. The half-timberwork and verandah would be in oak, and the roofs covered in sand-faced red tiles of uneven colour. The hall and stairs to be treated in walnut wood, with a deep canvas-stencilled frieze. The whole design is kept very simple with a view to economy and picturesque colouring. The architect is Mr. SYDNEY E. CASTLE.

CATHEDRAL SERIES: EXETER.—THE NORTH TOWER. THE NORTH PORCH.

ALREADY pointed out, will be found in the two towers now forming parts of the transepts. History is silent about their erection. The northern tower, of which we publish an illustration, is assumed to be from its treatment the later of the two, and mainly on account of the character of the arcading. Whether they were ever detached from the main structure cannot be ascertained. MACKENZIE WALCOTT believed they were erected to contain the bells which summoned the canons for service in the choir, while other bells found elsewhere were used to summon the congregation to festivals. The north porch is too low for so important a building, but the defect is to some extent atoned for by the height of the gable or canopy. It is thought that at one time the porch led to a music gallery which has been removed.

BEXLEY HEATH AND CRAYFORD.*

BEXLEY HEATH extends from Crook Log to Crayford; it is about one mile square. The Roman Watling Street (Vitellina Strata, which takes its name from Vitellius, the ninth Roman emperor) passes through this district, being the high road from London to Dover. Christchurch, Bexley Heath, is an ecclesiastical parish formed in 1866 from the mother parish of St. Mary, Bexley. In this locality are many dene holes. Hasted says:—"In the opinion of some they were formerly dug for the use of the chalk, but it is most probable that some of them were made by our ancestors as secret hiding-places for their wives, children and goods as well in times of civil war as of foreign invasion." Tacitus, treating of the manners of the old Germans, says:—"They used to dig certain caves under the ground, that when the enemy came and spoiled all that was abroad, then such things as were thus hidden either lay unknown or by this very means deceived him who sought after them." The Roman road is plainly visible on Bexley Heath.

Crayford is supposed by some to be Noviomagus, mentioned in the Itinerary of Antoninus. In 457 Hengist, the first Saxon king of Kent, met the Britons at Crecaford (Crayford) and gave them battle, slew four of their chief commanders and 4,000 men, and gave them such a defeat that they entirely abandoned this part of the country and fled with great fear towards London. The manor and church and three mills are described in Domesday. The church is dedicated to St. Paulinus, and stands at a short distance north-west of the village. It consists of a nave, chancel, side aisles, a square tower and five bells. The nave has the very singular plan of a row of columns and arches down the centre abutting against the chancel arch.

Rolls that many lands in Crayford were held of this manor, the Court Barons of which were formerly regularly kept, though they have been a long time disused. The manor-house is now made use of only as a farmhouse. It is deeply moated and the walls are very thick. An excellent illustration of this house appears in the volume of the Woolwich District Antiquarian Society for the year 1897. The manor-house of Newbury was formerly the seat of Mrs. Sarah Barne.

May Place is a handsome mansion about half a mile north-west from Crayford Church, and has been greatly modernised. It was erected in 1621, in the reign of James I. In 1694, on the death of Colonel Draper, the then owner, the manors of Howbury, Newbury and May Place were purchased by Sir Cloudesley Shovel. He was born in 1650, and went to sea as a cabin boy under Sir John Narborough. For his gallant conduct against the French at Bantry Bay he was knighted by king William III. and created a rear-admiral. He also took part in the victory of La Hogue in 1692. In 1705 he held command of the Mediterranean fleet, and in 1707, after the blockade of Toulon, he set sail for England, but was shipwrecked on the rocks of Scilly, where the ship foundered, not a soul of 800 on board being saved. His body being buried with others on the sands (at Scilly), was soon afterwards taken up and taken to London and interred in Westminster Abbey. Lady Shovel continued to reside at May Place till she died, April 15, 1732, and was buried in Crayford Church.

May Place is now occupied by the Barnehurst Golf Club, and by the kindness of the proprietor, Mr. C. H. Gray, we are enabled to inspect the house. Barnehurst, as well as Barne chapel in the church, takes its name from the former owners of

HOWBURY MANOR HOUSE.

HOWBURY MANOR HOUSE.

am informed by Mr. W. T. Vincent, the antiquary, of Woolwich, that he believes the only other example of this kind in England is in the church at Grasmere, Westmoreland.

In the fifteenth year of King Edward I. this church was valued at 40 marks. It is valued in the king's books at 5*l.* 13*s.* 4*d.* There are several fine monuments, and there as formerly an altar-piece given by Sir Cloudesley Shovel, of May Place. At the east end there is inscribed:—"Near this place an inscription formerly recorded that this church and chancel, being of late much injured and damaged, were restored and beautified at the proper charge and sole expense of Sir Cloudesley Shovel, Knight, Rear-Admiral of Great Britain, and Admiral and Commander-in-Chief of the Fleet. The present tablet was erected at Easter, 1879, by a later generation of worshippers, to keep in memory the pious munificence of one of the greatest seamen of his age. A.D. 1650-1677." There are monuments to Lady Shovel and other members of the family who are interred in this church.

Howbury Manor is described in Domesday Book when it was given by William I. to his brother Odo, Bishop of Baieux. After this it became part of the possessions of the family of Auberville. William de Auberville owned this manor in King Henry III.'s reign. It next became the patrimony of the ancient family of Northwood. Sir John Northwood paid knight's fee at the making of Edward the Black Prince a knight. It next passed in the reign of Henry IV. to Nicholas New, of Surrey, and into the hands of several families who are all described in Hasted. It appears by the ancient Court

Newbury Manor. The river Cray crosses the Roman Watling Street in this parish just before it falls into the Darent.

Red House.

Retracing our steps, we come to the Red House, Bexley Heath. This beautiful house was erected by the late William Morris, the poet and artist, in 1859. It was the first red-brick house built in the reign of Queen Victoria, and was intended as a revival of that true style in opposition to the shams of cement and stucco to represent false stonework. Red-brick architecture may be divided into four periods in this country—the Roman, the Mediæval, Queen Anne and Victorian. Of the Roman we have only a few old walls left, but plenty of their materials which were afterwards used in subsequent buildings, as at St. Albans. Of Mediæval brickwork the earliest and best example may be seen at Hurstmonceaux Castle, near Hastings. A good example has recently been revealed to us in the hall of Gray's Inn, erected in 1559, and which was formerly covered with cement. Of Queen Anne brickwork we have many examples in London, particularly in Great Queen Street, Lincoln's Inn Fields. After this came the deluge of cement and stucco, sham windows and bad workmanship. It was to remedy this state of things that William Morris built his charming residence.

William Morris was born in 1834 and was educated at Marlborough and at Exeter College, Oxford, where he formed the important and lasting friendship of Sir Edward Burne-Jones, the famous painter. In 1858 he published his first and greatest work, "The Defence of Guinevere." Soon afterwards, on March 24, 1859, he purchased this site and erected

* A paper read by Mr. W. F. Potter before the members of the Norwood Athenæum.

his house, Mr. Philip Webb being his architect. It stands on an acre and a half of ground, a large portion of which was converted by him into a lovely old English garden. The stained-glass windows were from his own designs, and the walls were painted with characteristic scenes by Sir Edward Burne-Jones. Among the visitors to his house, being his most intimate friends, were Ford Madox Brown, Swinburne, Burne-Jones and Dante Gabriel Rossetti. Morris had just met at

MAY PLACE.

Oxford the beautiful Jane Burden, whom he married, and whom Rossetti never tired of painting. Rossetti wrote in a letter in 1862:—"Above all I wish you could see the house Morris has built for himself in Kent. It is a most noble work in every way, and more a poem than a house, such as anything else could lead you to conceive, but an admirable place to live in, too." A good descriptive article of this house appears in *The Architect* of November 28, 1902, reproduced from the *Daily News*. In it we read:—"It was the first example of the

THE RED HOUSE, GARDEN FRONT.

revived use of red brick for Domestic architecture, and thus became readily known throughout the district as the Red House. It was the mother of thousands of such houses which now grace our English landscape from sea to sea, and Mr. Norman Shaw owed much of the inspiration of his fine work in our London streets to this original."

Besides the works of Morris and Burne-Jones, which are still to be seen in the house, Mrs. Morris stencilled with her own hands the decorations of some of the walls and ceilings, and so contributed to make it as it was afterwards described "An earthly paradise." After the death of William Morris this charming retreat was sold by auction December 8, 1902, and it is by the extreme kindness and hospitality of Mr. and Mrs. H. Muff, the present owners, that we have been enabled to inspect it this afternoon.

I will conclude with quoting a very curious epitaph to an old parish clerk in Crayford Church, as follows:—

The life of this clerk was just three score and ten,
Nearly half of which time he had sung out Amen.

In his youth he was married like other young men,
But his wife died one day, so he chanted Amen.

A second he took—she departed—what then?
He married and buried a third with Amen.

Thus his joys and his sorrows were treble, but then
His voice was deep bass, as he sang out Amen.

On the horn he could blow as well as most men,
So his horn was exalted in blowing Amen.

But he lost all his wind after three score and ten,
And here with three wives he waits till again
The trumpet shall rouse him to sing out Amen.

The illustrations of the Red House are from photographs by Mr. John Matthews, the others are from photographs by Mr. Charles Wheeler.

MEZZOTINTS.*

THERE are two distinct ways of engraving metal plates so as to be able to make prints from them, the intaglio and the relief.

The intaglio forms of engraving comprise line engravings with the burin, dry point and all forms of etching with acid.

The relief forms of engraving comprise such blocks as those cut for Pigouchet's "Books of Hours" in the fifteenth century, and those etched by William Blake for the cheap reproduction of his poems in the eighteenth century. The first of these two kinds of engraving has been most used as far as metal is concerned, as wood is easier and cheaper to make for relief blocks.

To print from a metal plate, engraved in the intaglio manner, a strong pressure is required, but to print from a relief block only a slight pressure is required, and in either case an impression can be made either in white or in black, according to the manner in which the intaglio or the relief block is inked and printed.

A mezzotinted metal plate is at first clearly an intaglio, but as the rocking proceeds and becomes closer, the resulting burrs are actually raised above the level of the normal surface, and to that extent the plate becomes a relief block. Like a relief block also it will print black, and as the surface is scraped away or burnished down, so also the resulting effect on the print is towards white.

The difference of the commoner lines made on a metal plate for the purpose of reproduction by printing shows clearly on one of my diagrams. The upper line is a clear cut out of the surface of the metal, a thread of corresponding size to the cut being removed. The next line shows the effect of an etched line on metal. In this case the metal is first covered with a thin coating of wax, specially prepared, and upon this a design is marked with a sharp point or needle cutting down to the copper. Then the plate is dipped in a solution of nitric or other acid, which attacks the metal in the places where the wax coating is removed and corrodes it away rapidly. If the plate is left too long in the acid this will undercut beneath the wax and make broad lines. I mean to say that the acid will, of itself, give other effects than those intended by the etcher, and of course it removes some metal. The next shows a dry point line, no metal being removed, but only a scratch made, throwing up at one side the same amount of metal as is moved by the hard scratching point; the action is similar to that of a plough driving a furrow and throwing up a ridge. On the metal this ridge is called a burr, and it has a very important effect on a print as it catches a quantity of ink behind its sheltering crest, and produces a thick, soft effect on the paper.

* A paper by Mr. Cyril Davenport, F.S.A., read at a meeting of the Applied Art Section of the Society of Arts.

The mezzotinting process removes no metal, except by accident, as, for instance, when the rocking is carried too far, then the burrs will get so small that they are apt to tumble off and leave only a roughened depression.

The most distinctive tool used in the process of mezzotinting metal plate is called a "rocker." It resembles a small spade, and is bevelled at the broad end, which has a curved outline. The flat side of the rocker is channelled finely or coarsely according to the wish of the engraver, and whenever the tiny teeth get worn down or perhaps broken in places, it is easily remedied by simply sharpening the edge as if it were a chisel, the effect of the channelling being to produce a toothed edge resembling that of a tooth-comb. In the early times of mezzotinting rockers were made so as to be used in the hand, but of late years an arrangement with a short pole has been substituted, and with this simple appliance it is much easier to roughen a plate than it was when the rocker was handled like a gimlet. The rocker as now used is no doubt a development from a roulette. The first mezzotinters were roughened by means of roulettes held in the hand. They were of many different forms, ranging from the small toothed wheel like the rowel of a spur, with a single line of points, to the broad disc, resembling a small garden roller, which was used by Prince Rupert and his followers. Between these two extremes the varieties of roulettes were many, and it is likely that each mezzotinter designed the form which he preferred for his own use. Roulettes were first used to roughen metal plates by L. von Siegen, who found that they were able to produce an effect, rapidly and easily, which, if done point by point in the known "pointillé" manner, would be slow and difficult.

The most valuable use of a roulette is not in its use alone, but as an accessory to rocked work; being quite small it is valuable to deepen the roughening in particular places, and it is also of great use in the event of too much scraping having been accidentally done. In former days mezzotinters generally had their own grounds, very often only working them where required, but now the whole of the plate is evenly covered with the rough grain, and this laying of a mezzotint ground is, moreover, done professionally, so that a modern engraver works on a ground with which he is in doubtful sympathy. I think that the professional laying of a mezzotint ground militates much against the true art value of the work of any engraver who works upon it. It is, however, a slow and tedious process, the plate having to be crossed some eighty times, and in these days of hurry we must perforce forgive it, as very few mezzotinters could, or would, spare the time to do it for themselves as they ought to.

The next important tool used in the production of a mezzotint is a scraper. Like the rocker, the scraper is of hard steel. It is a short sharp cutting edge set in a handle, and by its use the mezzotinter scrapes away the roughness on his rocked plate as much as he considers necessary. If the scraping is carried far enough all the marks made by rocker or roulette can be removed, and every scrape, when printed, shows more or less as a light place. Scrapers should be very carefully kept dry, as a sharp edge soon loses its value if any rust gets on it, and instead of a clean sharp cut, it makes a jagged scratch. The difficulty in engraving a mezzotint is in the use of the scraper, so much so that the phrase "scraped" by so-and-so is often heard referring to the engraver. Indeed it may almost be said, especially now that the grounding is usually done professionally, that the art of the mezzotinter consists of his skill with the scraper alone. There is, however, one more argument that is a dangerously powerful one. Dangerous because it can be made to do easily work of the same kind as can be done with some difficulty with the scraper. This instrument is a burnisher, and the work of flattening out the small roughnesses which are left by the scraper falls to its lot. A burnisher is a more delicate instrument than is a scraper, because its own function requires a perfectly polished surface to work with. If there is the smallest trace of rust on a burnisher it is not safe to use it. Early mezzotinters were by no means so careful about this as they might have been, and the result can be seen in numberless instances where places intended to be pure white show hair lines along their length. Such marks are probably due to small inequalities on the surface of the burnisher.

A hard steel burnisher acting on soft copper which has been rocked is capable of polishing out all marks, and consequently of creating a form on the plate which will show white in a print. Such a small point will be, however, a depression in the copper, and although polished, nevertheless a layer of copper is always likely to remain in it, so it is advisable to go over such points with a soft wooden point armed with a little emery, in order to get every atom of the ink out. Such spots can often be seen on the points of noses, and about the eyes, and for greater effect they are also often helped by the near neighbourhood of burnwork—sharp and black. Practically then, a mezzotinted plate is burred all over, and the artwork upon it is done by means of scraper and burnisher,

the effect of each of which is towards lightness. The more it is worked upon by these two instruments the lighter the print will be, and in a few places where greater strength of tone may be required, a roulette can be effectively used to restore the requisite darkness. Many fine mezzotints owe much to line engraving, dry point and etched work, but when any of these are found in any considerable quantity the engraving should properly be called in "mixed manner."

Much importance attaches to the inking of a mezzotint plate, more importance than has been credited to it. A bad inker and printer cannot make a good print from the finest plate, and a good inker and printer can make a decent print from a very bad plate.

Mezzotints were printed in colour at an early period in their history. Joannes Teyler, professor of mathematics in the military college at Nimeguen, at the end of the seventeenth century, printed several of his plates in colour, inking each plate carefully in the proper place with properly coloured ink. Then, a little later, J. Christophe le Blon began three-colour work. He engraved a separate plate to carry each colour, and used red, yellow and blue, with sometimes a key-plate in neutral tone. At least one of these plates was mezzotinted, but they are sometimes etched. He described his process in a tract entitled "Coloritto," published about 1723.

The finest colourwork of this kind is now done for the "Société des Amis des Livres," at Paris; the registering of their plates is marvellous and the effect beautiful. In England, Mr. Cadbury Jones endeavoured some short time back to introduce colour-printing for metal plates in the manner of Joannes Teyler, the plates being inked in the different colours, but his endeavours did not meet with the success they deserved.

The early exponents of mezzotint work were all amateurs. The first mention of it is contained in John Evelyn's "Sculptura," published in London in 1662, and he says it was described to him by Prince Rupert. Prince Rupert engraved a small head of "The Executioner," taken from the larger plate, for Evelyn's book, and this is, I believe, the first mezzotint ever published as a book illustration. Evelyn does not describe the process, but it was described by Alexander Browne in a book called "Ars Pictoria," published by him in 1669. In this description no mention is made of a scraper, but the directions advise the use of a burnisher for lightening the plate.

Prince Rupert was for a long time considered to be the inventor of the mezzotint, but it is now known that Ludwig von Siegen, an officer in the Hessian army, used a system of engraving which ultimately developed into true mezzotint. An excellent account of Von Siegen and his invention can be found in Léon de Laborde's classic "Histoire de la Gravure en Manière Noire," and in this book is a facsimile of a letter which was sent to the Landgrave of Hesse, accompanied with a print of a portrait of his mother the Landgravine Amelia Elizabeth, executed in the new manner. This print, of which I have an excellent slide, is in my belief all worked by means of a small single-line dotting roulette. Von Siegen's letter is dated August 19, 1642, and his print is considered to be the first important mezzotint. In places where the roulette has been used closely and strongly a certain velvety effect is found, and this, no doubt, being entirely new, gave the idea a start, which was followed up by Prince Rupert and others, and eventually became the chief characteristic of mezzotint work. I take it, however, that in all these early prints the mezzotinting or rouletting has only been done in the places where it was wanted, so that scraping was not necessary, whereas in a true mezzotint the rocking or roughening is systematically done all over the plate and afterwards cut away by means of a scraper as required. In Von Siegen's letter there is no mention of a scraper.

Prince Rupert learnt the new art from Von Siegen, and rapidly improved upon his master's work. Several of his plates are powerful and cleverly managed, the mezzotinting is only put where it is wanted, and there is little or no use of the scraper. The use of the burnisher on metal was well known in Prince Rupert's time, and any corrections he found it necessary to do upon his plates were probably done by means of this instrument. Prince Rupert most likely used a roller with a grooved surface to roughen his plates, and some of them show broad curved impressions from such an instrument. The early mezzotinters were not only amateurs but Dutchmen as well, the Canon von Fürstenburg being a contemporary with Prince Rupert. Wallerant Vaillant, a Dutch portrait-painter, assisted Prince Rupert, and himself worked a few plates in the new manner, but neither his work nor that of the Canon was particularly good. Under one of his plates, a portrait of Prince Rupert, occur the words "Prins Robbert, vinder van de Swaarte Prent Konst." The Van Somers and Abraham Blooteling also worked in England; in the case of Blooteling this is particularly fortunate, as his work is in every way excellent, and in consequence of his working here so largely, we count him in the list of English mezzotint engravers. Blooteling was the first to perceive the great artistic possibilities of the new process of

engraving, and he taught an assistant, Blois, to prepare his grounds, and these are well and evenly done. Also Blooteling used the scraper, which does not seem to have been used before in the particular way of lightening on all-over darkened plates. The question naturally occurs here as to whether it is possible to say from a print whether a pale place on a mezzotint has been produced by means of a scraper or by a burnisher. I have not time now to go into this question, but will only say that there are certain signs on all such pale places by which it can be said with some certainty how they have been produced. Blooteling came here in 1673, and his work quickly became much admired by line engravers, many of whom took up the new process as an amusement; but gradually its powers became more and more appreciated until at last our native engravers became so pre-eminently skilful that mezzotinting was known as an English art.

The early mezzotinters engraved principally after their own drawings, but very soon they became interpreters of the work of other men. At the same time, in a first-rate mezzotint, we must acknowledge a considerable amount of original merit, in addition to the skill of the copyist.

Like the Dutch the first English engravers in mezzotint were amateurs, the two first being William Sherwin and Francis Place. Sherwin counts first because he dated one of his prints, a portrait of Charles II. "1669," and Place dated none of his, though they may have been done earlier than Sherwin's. Isaac Beckett may be considered the first English professional mezzotint engraver. He worked about 1670 and took pupils, among whom was John Smith, afterwards one of our most famous engravers, and a very prolific one.

After Isaac Beckett English engravers in mezzotint increased rapidly in number, and they gradually took the art away from its Dutch votaries. At the same time, the foreigners remained here for some time, and executed much good work. Among these were some well-known artists—Vandervlaet, Verkolje, Van Bleek and Van Haeken.

During the eighteenth century we do not find the same preponderance of Dutch workmen, but the English names occur almost exclusively. In the beginning of the century John Smith worked most successfully, and was followed by a numerous band of famous engravers, many of whom, owing to the revived appreciation of mezzotints, are now well known.

John Faber, jun., is best known for his engravings after the portraits of the members of the Kit Cat Club painted by Sir Godfrey Kneller. The club was originally political, but soon lost that distinction, and the club-room in Jacob Tonson's house at Barn Elms was too low to admit the usual full-length figures, so Kneller made his canvases 36 by 28 inches, and christened this size of picture after the name of the owner of the original meeting-house, Christopher, or Kit Cat.

About 1714 George White inaugurated the introduction of etching into the mezzotint world: he strongly etched his subjects before putting in the mezzotint tones. This principle was afterwards much followed, especially in the case of large subject pieces.

A large proportion of eminent eighteenth-century mezzotint engravers came from Ireland, the most eminent of whom was James MacArdell. He largely engraved after Sir Joshua Reynolds, who himself declared his belief that he would be immortalised by MacArdell's work. Then there was his fellow pupil with Brooks, Richard Houston, and Thomas Frye, who engraved large portrait heads after his own drawings about 1740. Other noted Irish engravers were E. Luttrell, Thomas Beard, W. Baillie, John Murphy (who, unfortunately, has only left a few rare plates, all very fine), J. Brooks, Ed. Fisher, Ch. Spooner, J. Dixon and Richard Purcell.

These engravers and their English contemporaries of the eighteenth century have left an unequalled series of magnificent portrait engravings after the works particularly of Sir Joshua Reynolds, P.R.A., J. Hoppner, R.A., Sir T. Lawrence, P.R.A., G. Romney and T. Gainsborough, R.A., all notable for the beauty of their female types, and in the matter of subject pictures they have engraved chiefly after the works of G. Morland, W. Hogarth, Benjamin West, P.R.A., and J. Zoffany. Among the most notable of the English mezzotinters of the latter half of the eighteenth century, Valentine Green is one of the best known. He had several pupils, of whom John Dean, one of the most delicate of engravers, is perhaps the most eminent. In 1777 Richard Earlom engraved a set of mezzotinted etchings after Claude Lorraine, one of which I have to show you as an experimental slide. J. R. Smith, son of Smith of Derby, was one of our greatest engravers in mezzotint; he made some plates after his own drawings, but is chiefly known for his beautiful interpretation of the works of Sir Joshua Reynolds.

J. Walker, Jonathan Spilsbury and C. Turner were all first-rate engravers in mezzotint. C. Turner was a relation of J. M. W. Turner, our greatest landscape-painter, and he assisted his eminent kinsman in the engraving of some of the plates of the "Liber Studiorum."

During the early part of the nineteenth century portraiture

still maintained its supremacy, but the application of mezzotint to landscape art is characteristic of a later period. S. W. Reynolds, a pupil of J. R. Smith, was a very successful and skilled engraver. He engraved a series of 357 small mezzotints after the work of Sir Joshua Reynolds. These small plates form an illustrated index of Sir Joshua's work, as far as S. W. Reynolds could find it. They are, however, not quite satisfactory, as the process of mezzotinting does not suit very small work any more than it suits very large work. S. W. Reynolds also engraved several plates after his own drawings.

William Say is noteworthy among the earlier nineteenth-century engravers, as he executed a small portrait of Queen Caroline in 1820, which is the first mezzotint engraved upon steel. Underneath the first proof made from this plate is a note:—"This attempt to engrave on steel was made in 1820—W. Say." The portrait is not very pleasing, but many mezzotinters have worked in steel since with much success. No doubt the great durability of steel is much in its favour, but there are several technical difficulties connected with its actual use for engraving upon directly, and this has led to the modern evil of mezzotints engraved upon copper being covered with a thin film of steel, so as to give them a lengthened life. From such a steeled plate an infinite number of identical prints can be drawn. From mezzotints engraved upon a copper-plate about fifty prints of the finest quality can be drawn, after that the plate begins to deteriorate. The beauty of a print from a copper-plate is a rare beauty; that of a print from a steeled plate never can be rare, neither is it equal in quality to a print made before the steeling operation was done. There are certain checks upon the indiscriminate production of prints from steeled plates, but I doubt if they are reliable.

J. M. W. Turner no doubt admired R. Earlom's etched mezzotints of Claude Lorraine's "Liber Veritatis," and it appears likely enough that this gave the former the idea of his "Liber Studiorum," issued in parts between 1807 and 1819. Turner made small sepia sketches, from which he etched the outlines on copper, and then had the light and shade filled in by various engravers in mezzotint or aquatint. Turner himself mezzotinted some of them. Of their kind they are the finest things that have been done, and they have always been favourites with collectors because of the difficulty of getting a complete set of proofs. Turner issued the prints in sets, "Prints" and "Proofs," but as a fact they were all mixed, so that to get a real set of proofs together involves a long search and much tribulation.

Quite recently Mr. Frank Short, best known as an etcher, produced a few etched and mezzotinted plates from sketches by Turner, done in the same manner as the old ones, to which they clearly approximate in every way.

T. G. Lupton was the first mezzotinter to work largely upon steel, and he chiefly engraved landscapes. For his success in working this process upon soft steel he received the medal of the Society of Arts in 1822. His work is, I think, the most pleasing of any mezzotinted landscapes; this is partly due to the fact that he used a brown ink by preference. Brown ink is troublesome to manage on steel. I think, altogether, that landscapes are hardly satisfactory in mezzotint, but that the finest effects are to be found among the splendid series of full-length portraits of ladies, after Sir Joshua Reynolds, or one or other of the artists of his period. Three-quarter lengths are perhaps the more usual form in portraiture, both in portraits of men as well as women, but there is a completeness about a full-length which is necessarily wanting in a portrait representing any lesser degree.

David Lucas is particularly known for his interpretations in mezzotint after the landscapes of John Constable, R.A. They are as a rule too dark, and are printed in black ink. Some times pleasanter prints have been drawn from a worn plate than from a new one, as they are paler. At the same time the original pictures are dark, but I think that if Lucas had used a browner ink, as Lupton did, his landscapes would have been pleasanter. He nearly always engraved on steel. Lucas died in 1881.

Samuel Cousins brings us up to modern times; he gave up work in 1883. His work is always delightful. In 1814 he was apprenticed to S. W. Reynolds, and presently set up for himself at 104 Great Russell Street. He engraved largely both portrait and subject pieces, and his plates are very fully etched before the mezzotinting is put on them. His style may be considered as the modern one, as it has formed the keynote for most of his successors. A large plate engraved by him, after Landseer, "Bolton Abbey," executed quickly and very effectively in etching and mezzotint, is supposed to have given the death-blow to the old-fashioned, slow and expensive process of line engraving. It was published in 1837. He engraved largely upon steel.

Mezzotints can now be very efficiently copied by means of photogravure—a form of etching—and probably this process may yet attain greater perfection. At present it leaves something to be desired in the matter of brilliancy—there is too

much loss of light. But a photogravured plate can be worked over to almost any desired extent by rocker or roulette, burnisher and scraper, so that it can be made almost identical with the original. A photogravure made direct from a painting is often very good, but here again it generally needs a little skilled handwork in weak places.

What with steel-plating of copper-plates and the direct competition of photographic processes, it is probable that mezzotinting as a high art has had its day. Except for the work of a very few living engravers of the first rank in this method, mezzotinting has already reached its highest development, and we may well be proud of the beautiful examples which have been left to us by MacArdell, Valentine Green, J. R. Smith and others of their period, men whose talent has been great enough to earn for their particular art of engraving the title of "La Manière Anglaise."

FIRE-RESISTING BUILDINGS.*

As you may imagine, the subject of this paper is not one which I should have chosen, and if it turns out that it has no fresh information to offer you, the excuse must be that nearly all that can be said on the subject has already been dealt with. Still, renewed consideration on the subject may bring out some fresh points, and if I cannot give any useful hints I always console myself with the hope that the discussion may bring out forgotten or overlooked information.

One might admit at once that to make all existing buildings in London fire-resisting is a practical impossibility, so that you must take my remarks only as suggestions as to what might be done towards making buildings less inflammable than they are at present; even this might involve such an enormous expense that the owners of all classes of property would, I fear, look on my ideas as not in their particular interest; however that may be, we all have a duty to do towards our neighbours, and that consists partly in making buildings as safe as can reasonably be expected against danger to life and property therein contained.

To carry out the idea of this paper in a logical manner I should begin by dividing up the districts of London into risks, and then the buildings in these districts into subdivisions of risks, but this sort of work, I think, I may safely leave to those whose particular business this is, from an insurance point of view; my chief concern will be to deal with constructional details only, combined of course with the inherent danger there always is in the proximity of one building to another—always a source of real danger in large cities such as London. For instance, particular portions of the City of London have unfortunately got the reputation of being what are called dangerous areas. This may be due not only to the buildings themselves, but also to the nature of the goods stored therein, and for this class of building I am afraid little can be done. The only thing we can hope for in this division of the subject is to render them less liable to communicate fire to those adjoining.

On the other hand, large numbers of buildings not having within them goods or materials of a particularly inflammable nature are built or fitted up, and particularly the latter, in such manner as to render them very dangerous when by some unfortunate accident they do get on fire.

Many of these buildings in their construction contain all the elements of danger, both to themselves and to their surroundings, and it is more particularly with regard to these that I consider a paper of this nature should call your attention. The idea of pulling down London wholesale, or converting all its buildings at one time into what are erroneously called "fire-proof" structures, is eminently absurd. Still, much might be done at a moderate expense, which would render buildings and whole areas much less dangerous than they are at present.

Match-Board.

For instance, take the one item "match-boarding." It is used in all sorts of places, in most of which it could very well be done without as regards the construction, and it is a material which, so far as safety in case of fire goes, should not be allowed to come under any consideration whatever. And yet one hears very often against it, probably because no one thinks of the extra danger involved in its use, or does not want to think, simply because it has been used heretofore and it is convenient, easily put up and just as easily removed, requires no time to dry, and is easily painted or decorated. Its use on walls and ceilings, particularly the latter, is much to be deprecated. I am now thinking more particularly of boarding made from soft woods, which when dry and painted or varnished is highly inflammable, and fire passing along it at a high speed, often rendering escape from a building impossible, even in the early stages of fire.

A paper prepared for the International Fire Prevention Congress, at London, 1902, by Mr. Max Clarke, A.R.I.B.A., entitled "How to make existing buildings more fire-resisting."

The limited use of hard woods as wall covering for decorative purposes is not objectionable, particularly if fixed without any air space at the back. In all discussions of the present nature we should be most careful not to advocate views which would prove to be what may be called so excessive as to frustrate the very object intended. I would only make one further remark with regard to this class of material, and that is how fatal the results are when it is used as a ceiling covering with plenty of air-space behind, seemingly specially arranged to create rapid and intense combustion.

In making these remarks I am quite aware that in the opinion of many this class of wall and ceiling covering possesses certain advantages, being suitable for buildings in which certain trades are to be carried on. My object is to impress upon you that these ideas are already antiquated, and that for every class of building and every trade some form of covering can be found equally suitable from all points of view, without any of its special element of danger.

Naked Ceilings.

We may now pass on to a form of construction which, alas! is even more common in London than the one above mentioned, viz. leaving large areas of the floor joists of buildings without any covering whatever on the underside. This is done, of course, with the clearly defined object of saving money in first cost, and it does save a certain amount; but whether that saving is commensurate with the greatly increased risk such a system of construction involves is for you to decide.

I hope it will not be one of the arguments during the discussion that numbers of buildings constructed in this manner have never had a fire in them. This does not seem to me to be a discussion at all, at any rate it is not fire preventive discussion.

There is one aspect of the case which must not be overlooked, viz. What is fire protection worth? In these days of commercial speculation most buildings have a remunerative value, beyond which the speculator will not go; his idea is that, given a building which can be insured at a reasonable rate, it would pay better to build it in the cheapest manner than to expend a larger sum on a more fire-resisting building. The risk of its being burnt down is taken as a quantity worth so very little consideration that in many cases it is accepted in preference to the safer building. This, of course, is the difficulty met with in any attempt to make fire prevention general. But for this London would be fire-resisting, and I should not be before you at this moment.

However, I have to try and bring to your notice items in everyday construction which could be brought into line with modern ideas without wholesale reconstruction.

The cure for the evils which I have already pointed out is that in future match-boarding should not be used in new buildings, and after a certain date it should be removed from all old buildings. The naked joists in ceilings could easily be corrected, and the ceilings made fire-resisting by covering them with wire netting or some form of expanded metal and plaster.

Studded Partitions.

I need hardly remind you that the ordinary wood partition, with its wood lath and plaster covering, leaving hollow spaces from top to bottom, should be a thing of the past. Unfortunately such is not the case, in spite of the numerous forms of light partitions made which are non-inflammable and have no open spaces. Why the latter are not used it is hard to say, but if after a certain date stud partitions were to be abandoned it would render London as a whole much more fire-resisting than it is at present, and at a moderate cost.

Lift Enclosures and Doors.

I must now turn to a matter which seems to me to be most important in buildings of the warehouse class, namely, the means adopted at present for the prevention of the spread of fire in lift wells and generally in vertical shafts of this class. There is no doubt that this particular risk is not sufficiently considered, and great improvement could be made as regards retarding the spread of fire if all lift shafts were properly enclosed with some form of non-combustible material. The particular nature of the material I need not attempt to specify, as it would largely depend upon whether the building was an old one or in course of construction. If the latter, there is no doubt brickwork would be the most suitable, but some other enclosing material would be efficacious, at any rate for short periods, and it is these short periods which in the initial stages of a fire are of the utmost importance.

The doorways or openings to the lift shafts should not be mere openings, as is so often the case at present, or if the openings are fitted with doors they are too often of an open type, not in any degree preventing the passage of smoke and flame up the shaft. Iron doors are often fitted to openings in cases where there is a solid enclosure; but the doors are not close fitting and the fastenings are not designed with a proper regard to ease in opening and closing, and quite regardless as

to their adequacy for preventing the doors bending or twisting when heated to a high temperature. Where the latter is possible, of course flame and smoke pass through the small openings and ignite inflammable material on the other side, thus contributing to the spread of fire to an alarming extent.

Fire-resisting Doors.

Another small matter I have observed in connection with iron doors, which should be avoided if proper fire-resisting qualities are to be obtained, is the total neglect displayed in keeping inflammable material at a sufficient distance from iron or other forms of fire-resisting doors. Only by exercising proper attention to this point can the full value of such doors be obtained. A door may in itself be a good stop against fire, though it become red-hot; but it is useless if in contact, or in close proximity to combustible material on one or both sides. Attention to this matter is sadly wanting at the present time. Wood floors should not be carried up to the iron door frames, but a fairly wide threshold of concrete, stone or the like should be formed on each side, and the same remark applies to the whole of the opening on both sides, as it is impossible to foretell on which side of the opening or shaft the fire may occur.

Fittings.

The same remark applies to fittings in shops and warehouses, not to say public buildings. Often after the building has been left fairly secure in the direction above mentioned, shop or other fitters come on the scene and fix woodwork everywhere as trade fittings, totally regardless of the fact that should a fire occur—and I presume we are all agreed that they do occur—when least expected, from one form of accident or another, and it is only by bearing these facts in mind always when designing, constructing, altering or fitting up a building that the fire-resisting qualities of a structure, district or city can be improved.

Fireplaces.

I shall now call your attention to some of the defects in fireplaces and flues which are being repeated every day in modern building work, and I hope you will understand that throughout my paper my attempt is to show the defects in London building, as it is only by deciding what the defects are that remedial measures can be taken.

Few know the number of fires caused by defects in and about the fireplace. Personally I am disposed to think that most of the causes are brought about by careless workmanship, and a few perhaps by the use of methods which were quite adequate in former times, before the invention of what are now called slow-combustion stoves, close ranges, boilers and the like. I place first in point of danger the practice of building half-brick trimmer arches to carry hearths in wooden floors, the arches having the centreing left in and forming an open space under the brickwork. The underside of this space is lathed with wood laths, and plastered in the same plane, as a rule, as the rest of the ceiling. This form of hearth should give place, in my opinion, to a concrete or other self-supporting hearth, the full depth of the floor joists, having a flat soffit on which the plaster could be applied direct. Next I should like to advocate the use of fireclay linings to all flues, a common practice in many districts, but not in use as a rule in London, instead of improperly bonded and badly built flues, the brickwork of which is only $4\frac{1}{2}$ inches thick, and in which bad mortar forms a considerable component part, and which after a time drops out leaving the joints open. This is often assisted or caused by the nails, spikes or plugs driven in for the purpose of fixing inflammable finishings. All these defects lead to a considerable number of fires annually, the details of which I am sure my insurance friends know a great deal more about than I do. Wood finishings should not be fixed with iron spikes in front of flues unless the brickwork is of a greater thickness than $4\frac{1}{2}$ inches; in fact, it is probable that a great safeguard against fire would be effected if woodwork in such proximity to flues was abandoned altogether. It seems to me a cause of danger that flues built with only half-brick surroundings are at times used for high-pressure boilers, kitcheners and the like, the brickwork being quite hot when work is in progress, and in many cases much too hot for safety.

New types of stoves of either the "slow combustion" or "well fire" classes should not be fixed in old houses unless a thorough examination of the hearth and its surroundings is made, numerous fires having been caused from timbers being in close proximity to chimney-breasts quite unknown to the people who fixed new and powerful stoves in old openings.

Areas, Light Wells and Narrow Streets.

In cities like London where land is of such great value the size of areas and light wells will always be reduced to the smallest possible dimensions, thereby greatly increasing the risk of fire spreading from one building to another. The same remarks hold good with regard to narrow streets and courts. In cases such as these the only precautions which can be adopted are of a protective nature.

Windows in light wells should not be directly opposite each other, should be fitted with metal, or at any rate with hard wood frames; the glass should be wired or armoured so that when cracked it would not drop out of the frames at once, thus allowing the passage of flame from one building to another with fatal rapidity. In more dangerous cases blinds of non-inflammable material might be used with advantage, or, better still, shutters which would fit the openings closely, constructed in such a manner as to prevent much twisting or buckling and provided with fastenings, which while admitting of rapid adjustment would be secure against opening by accident or from falling bodies on the outside.

Shutters or blinds for use in courts or areas might be made of woven wire mounted on frames. This form would admit of a certain amount of expansion or contraction without damage to the frame; would admit a certain amount of light, which is always an advantage, and could be seen through from the inside, also a benefit in many cases.

In connection with any form of shutters such as above advocated, the objection to having wood finishings near them cannot be too strongly brought before your notice. Any real advantage the shutters might be in case of fire in an adjoining building would be largely discounted if inflammable material was close to the openings supposed to be protected by the shutters.

My paper is practically at an end. I hope you did not expect startling theories, for most certainly you have not heard any, and for this omission I suppose I should ask your indulgence.

My opinion on these matters is that we do not take advantage of the information we possess. Knowledge is of no use whatever unless properly applied, and my contention is that there is a vast store of information on this particular subject which is not made the least use of. What has been done before is repeated without properly examining the new methods with the object of applying any which might suit particular cases.

I have not dealt with any of the modern forms of fire-resisting construction; many types are so well known that they need no words of mine either of praise or condemnation. All I would say is that as a rule the details are not sufficiently attended to. In the case of sanitation we have for many years had good pipes, but even now we sometimes have not got good drains, and only by the very closest attention to the minor details shall we ever get them. It is exactly the same with every form of fire-resisting construction and any attempt to make buildings or districts safer than they are at present. If I may digress from the subject for a moment, I would like to address a word to "the man in the street," if any such be here, as to the saving of life from fire. Has he ever thought of the value of 50 yards of moderately stout rope and a block or pulley with a hook in the ceiling in front of a window? Why such a modest equipment should not be in every house I cannot imagine. A stout belt with its ring and spring catch would be an advantage; but I say, given the rope and block, there is no reason why escape should not be practical for men—and for women also when there are men to assist them—from every building in London. With regard to such places as Eton or other public institutions, each individual should provide himself with his own rope, as he does his cricket bat or fountain pen. It might be years before it was required, but when required it should be in perfect order, ready for use at a moment's notice. We are desirous of helping all sorts and conditions of men and women, but it is also expected that they should do something to help themselves.

TESSERÆ.

Effects of the Fire of London.

WHATEVER may have been the cause of the Fire of London, no one will now doubt that the effects are as described some years afterwards in a letter from Dr. John Woodward, professor of physic in Gresham College, to Sir Christopher Wren. That "however disastrous it might have been to the then inhabitants, it proved infinitely beneficial to their posterity, and to the increase and vast improvement as well as the richness and opulence of the buildings. And how by the means of the common sewers and other like contrivances such provision was made for sweetness, cleanness and salubrity, that it is not only the finest and pleasantest but the most healthy city in the world; inasmuch as for the plague and other infectious distempers, with which it was formerly so frequently annoyed, and by which so great number of the inhabitants were taken off the year before the fire. An experience of above forty years since hath shown it so wholly free from, that it is probable it will be no longer obnoxious to, or ever again likely to be infested by, those so fatal and malicious maladies." To Dr. Woodward's forty years' experience we may now add nearly two hundred more, as additional proofs of

the beneficial effects of the Great Fire upon the health and prosperity of the Metropolis. A new city was now to be built, and as Dr. Sprat, while the ashes of the ruined city were smoking around him, said, "on the most advantageous seat of all Europe for trade or command." Well did the king and his people apply themselves to the task, particularly the citizens of London, who showed a greatness of mind, a philosophy of endurance and a pious resignation to the will of Heaven, amidst the smoking ashes of their hearths and altars, surrounded by the green graves and mounds of the remains of their kinsfolks, called away by a fatal and unavoidable pestilence, and by the crowded hospitals of their sick and wounded countrymen in a calamitous war, worthy of all Greek or Roman fame, nay higher, it was worthy of their Christian profession. "If philosophers had done this," says the before quoted historian of the Royal Society, "it had well become their profession of wisdom; if gentlemen, the nobleness of their breeding and blood would have required it; but that such greatness of heart should be found among the poor artisans and the obscure multitude is, no doubt, one of the most honourable events that ever happened."

Animal Worship in Egypt.

The worship of living animals was subordinate to that of the gods, and the animals were supposed to be incarnations of the souls of the deities they represented. The worship was referred to the most remote antiquity, and said to have been introduced by Kaiechos, a monarch of the second dynasty. The animals were attached to the temples of their respective gods, kept in shrines or other places provided for them, and their actions interpreted as ominous. The principal sacred animals were the cynocephalus ape, the lion, the cat, the dog or jackal, the bull, the white cow, the ram, the sheep, the goat, the hare, the hippopotamus, the shrew-mouse. Amongst birds, the hawk, the vulture, the ibis and the goose. Of fish, the eel, the latus, the lepidotus, the phagrus. Of insects, the scarabæus; and of reptiles, the crocodile, the uræus or cobra di capello snake and a larger snake like the boa. The sacred animals were reared, fed and taken care of with great luxury, and all the animals of the town or district where any species was worshipped were protected and not killed. It was death to slay intentionally a sacred animal, and even an accidental killing of such an animal entailed punishment and required expiation. After death they were carefully embalmed and deposited in mummy pits or in tombs specially reserved for them. The reason of their worship is involved in much obscurity, and was supposed to be owing to their utility to mankind, their supposed peculiar physical qualities indicating symbolically the deities to which they were sacred, or to the tradition that the gods formerly changed themselves into the shapes of animals. The rivalry of different towns and the quarrels with each other about their sacred animals often gave rise to fearful conflicts, and caused some to suppose that this worship had been introduced to cause dissension and disunion. The ape, sacred to Thoth and Khons, was worshipped at Hermopolis; the jackal, sacred to Anubis, at Lycopolis; the cat at the same town, the dog at Cynopolis, the lion at Leontopolis and Heliopolis, the cat at Bubastis, the otter at another site. Of the sacred bulls, Apis, sacred to Ptah, was worshipped at Memphis; Mnevis, to Ra or Atum, at Heliopolis; Paht, in the same place; Pacis, emblem of Amen-Horus, at Hermopolis; the antelope at Coptos, the ibex at Thebes, the sacred cows of Athor at Hermonthis and Atarbechis, the sheep at Sais and the ram at Thebes, the hippopotamus at the Iupremite nome in the Delta, the ichneumon at Heracleopolis and the shrew-mouse at Athribis. Among birds, the eagle, sacred to Horus, was worshipped at Thebes; the sparrowhawk, emblem of the same god, at Heracleopolis; the raven at the Emerald mines, near Coptos; the vulture at Eleithyie; the falcon had no city, but is found mummied; the ibis at Hermopolis; the stork was also worshipped, and the goose at Canopolis. Of fish and reptiles, the crocodile was worshipped at Arsinoe, Ombos, Coptos and Thebes, and found mummied at Manfalut; the fish latus, sacred to Athor, at Cynopolis; the lepidotus at Lepidotopolis; the oxyrhinchus in some of the same name, the mæotes at Elephantine; the crocodile was sacred to Hapi or the Nile; snakes worshipped at Thebes, to Theban goddesses, and the scarabæus emblems of the god Ra, elsewhere.

Egyptian and Mediæval Proportions.

The employment of diagrams of squares by the ancient Egyptian artists for the setting out of their sculptures has been described by Owen Jones. It is objected, however, that this is only a method of transferring and reducing figures, such as commonly used at the present day by artists and engravers in reducing and transferring their pictures. There must, however, be something more than this. The squares were not simply to guide the hand of the draughtsman, but actually to set out the proportions of the figure. It seems that a tablet for an erect figure was divided into nineteen squares

high and ten wide, and that for a sitting figure of the same total height into fifteen high and fifteen wide, and that in both cases the dimensions of the body and of its several members were set out by a like number of these same squares. Thus three were given to the height from the shoulder to the crown of the head, four to the length of the forearm, three to the length of the small arm, one to the hand, four to the thigh, one to the knee, four to the leg, one to the height of the foot, and three to its length. Moreover, the dimensions of the hieroglyphics were determined in the same way. And although there are several trifling (evidently artistic) deviations, there are signs of purpose and system which cannot be mistaken. And as Owen Jones remarks:—"The facility which, after constant practice on the same ever-recurring lines, some of these workmen have obtained of preserving the peculiar character of Egyptian art is very remarkable, and helps us to understand how, by the division of labour, those vast undertakings of Egypt were accomplished." And again, "Whilst obedient to religious laws, which limited the direction of their art, they combined the highest sublimity of conception with the most refined and delicate finish of execution." Why then are we unwilling to believe that the works of Mediæval art were carried out by similar processes, when it is found that their dimensions do exactly coincide with a comprehensive system of proportion of another kind? The Egyptian is called the "parent of all other arts," and the Egyptian artists were able to produce "exquisite beauty, refinement and grandeur," though they did restrict themselves to the use of such "line and rule" processes. And "whilst obedient to religious laws, which limited the direction of their art, they combined the highest sublimity of conception with the most refined and delicate finish of execution," though its artistic character underwent the same process of decline as our own art did. The most natural account of the matter is that Mediæval art like theirs was subject to the restraint of conventional rules. For such uniformity of character as shows itself not only in manner of form, but also in the proportions of the general outline, extending itself even to the proportion of details, could not have arisen simply from the imitative or from the æsthetic power of each individual architect. Against the practical utility of this theory it has been objected that if we subject ourselves to such rules "we must give up designing in the high sense of the word, and, having a base-line and the style given, we shall only have to put it into a machine and it will come out all right without any head or heart work." Rules of art without genius are like a body without a soul. No man can ever be an artist without a soul to appreciate and to create beauty; nor can he "by line and by rule" alone produce any work worthy of being called art. It was not Coleridge's knowledge of the laws of metre that made him a great poet, nor was it Haydn's knowledge of the laws of harmony which made him a great musician; yet we cannot imagine the former to have been ignorant of prosody nor the latter of thoroughbass or counterpoint.

English Roads in the Eighteenth Century.

It was soon after the year 1700 that a part of the charge of repairing roads was taken off the respective parishes through which they pass and levied on the general traveller by means of turnpike gates, but it was for many years a complaint that the roads were little, if at all, fundamentally improved by the expenditure of the money so raised. This complaint is very energetically advanced in a "Dissertation concerning the Present State of the High Roads of England, especially of those near London, wherein is proposed a new Method of Repairing and Maintaining them," read before the Royal Society in the winter of 1736-37 by Robert Philips, and printed in a small separate volume. The author's great object is to recommend washing the roads by a constant stream if possible, and at any rate washing the materials of which they are composed. In this respect, notwithstanding the existence of single roads so situated that the effects of water upon them have been very beneficially introduced, his plans for the universal employment of water have been altogether superseded by later experience; but he remonstrates with greater propriety against the practice, which has, however, continued to prevail so generally till of late years, of laying down large heaps of unprepared gravel, to be gradually consolidated into a harder mass, at the expense of the intolerable labour of the poor animals that are obliged to grind it down. As an illustration of the good effect of water, he mentions that even the sediment deposited by it at the bottom of Fleet ditch, which was supposed to be a soft mud and to require removal when the ditch was filled up, proved, in fact, to be a hard gravelly substance, which afterwards afforded an excellent foundation for the roads and buildings supported by it. The attention of the public was afterwards directed to the subject of roads and carriages by several essays which appeared in the "Communications to the Board of Agriculture," and also in a separate form. But the suggestions of these writers were in a great measure superseded by the success of Loudon Macadam, a gentleman whose practice was

marked by simplicity and economy, though he also had the merit of discovering that the simplest and cheapest methods in particular cases, especially in that of boggy soils, are also the most effectual. His leading principle was "that a road ought to be considered as an artificial flooring, forming a strong, smooth, solid surface, at once capable of carrying great weights, and over which carriages may pass without meeting any impediment."

Italian Veneering.

The practice of overlaying buildings with thin slabs of marble is open to this objection, that if the slabs are quasi-constructive in their distribution they involve a sham; if not so they disturb the constructive idea which is so desirable to keep up in dignified architecture. The practice is, however, fair and admissible, if not pretending to be constructive, but it would be much better to limit it to panels and other subordinate parts, the genuine walling material being shown around it. At St. Mark's, Venice, the slabs are placed with their longest dimension vertical, as if to prevent any thought of their pretending to be constructive. In the domestic buildings at Venice, the windows being generally of marble while the walls are of plastered brickwork, the former are made almost like a modern chimneypiece, the whole window construction being cut out from the wall into which it is built by what a modern mason would call an "out ground," or thin strip of marble (perhaps an inch and a half thick), built edgeway into the wall, and enclosing the ornamental dressings of the window. The edge of this slip of marble is cut into the peculiar Venetian dentil. Coloured marbles are often used within this framing.

The Albert Memorial Plates.

SIR,—In your admirable reproductions of the sculpture of the podium of the Albert Memorial an unintentional slight was cast upon Mr. H. Armstead, R.A., which I trust in justice to him you will put right. The two sides which you have published were his work entirely; there was none of Mr. Philip's. Pleased with these reproductions myself, I showed them to Mr. Armstead, and it is from him that I have ascertained that the description is incorrect. It is more than thirty years ago since these were completed, and it shows how little real interest the general public take in the art of sculpture in this country when even in an artist's lifetime his work is attributed partly to someone else—Yours, &c.,

THE CURATOR OF THE SOANE MUSEUM.

[We are afraid his office has had an ill effect on the curator. To live in a mausoleum cannot be healthy. If the curator would venture to brave the perils of a journey to Hyde Park he would discover that the podium of the Albert Memorial has four sides. The four were reproduced in *The Architect*. The curator has obtained two of these plates, and apparently believes he has a representation of the whole before him. If he were acquainted with the history of the work he would know that the late Birnie Philip was the sculptor of the representative figures of architects and sculptors, just as Mr. Armstead was of the painters, musicians and belle-lettrists. The two sculptors were selected by Gilbert Scott because he was aware from his own experience of their ability as architectural sculptors. The sculptors of the groups and of the statue of the Prince were not nominated by him. In the podium it is easy to see co-operation to attain one end. The four parts can be arranged in any way desired without any loss of character. They are now, and will be hereafter, regarded on account of the characteristics they have in common as the work of Henry Hugh Armstead and John Birnie Philip. We associated the two names on the plates because we believed our readers would recognise the peculiar unity of the work. There was no anticipation of a curator rising from the depths and assuming a part to be the whole. The two sculptors marked their panels, and where the names have survived they have been reproduced on our plates. On the moulding of the "Architects," J. B. Philip, sculptor, is legible, and on the moulding of the "Musicians and Poets," H. H. Armstead, sculptor. In the sepulchral gloom which environs the curator they are probably invisible. As the sections appeared care was taken to point out the share of each sculptor in the joint work. One example will suffice. In *The Architect* of January 2 it was said:— "There is so much unity of spirit in the arrangement, the names of Mr. Armstead and Mr. Birnie Philip are likely to be always conjoined in every description of the memorial. It is

well, however, to note that the series of architects as well as the series of sculptors were executed by Mr. Birnie Philip while the painters, poets and musicians were undertaken by Mr. Armstead." The last sentence of the curator is reminiscent of "Meditations among the Tombs." What the general public may think about the podium and its sculptors we dare not determine. Probably, from the general effect, they assume the groups to be a single inspiration, but executed by various hands. A similar conclusion has been drawn from the frieze of the Parthenon. But it is saddening to find a curator coming forward in defence of one of the sculptors and ignoring the facts that there were two, and that the success of the work is owing to their loyally working on the same lines at some sacrifice of their own imagination. We hope Mr. Armstead does not agree with his champion, nor consider the mention of his old comrade's name to be a "slight" on himself.]

GENERAL.

The Portrait of Rodin, by Mr. John W. Alexander, the American painter, has been purchased for the Fine Arts Museum of Cincinnati, where it will be placed in the permanent collection. The work was awarded a gold medal at the Paris Salon 1900.

A Long Inquiry was held in Bombay in connection with the collapse of a building on May 31, whereby three Europeans and one native were killed. The jury returned a verdict of culpable homicide, not amounting to murder, against the owner and constructor. Both were committed for trial at the sessions.

Mr. A. J. Gaskin has received the appointment of master of the School for Jewellers and Silversmiths, Victoria Street Birmingham, in succession to Mr. Catterson Smith.

The Work now proceeding in front of Buckingham Palace is the first portion of what is required to prepare the site for the National Memorial to Queen Victoria, and includes the levelling and laying-out of the site, and the building of the necessary retaining wall in St. James's Park. All the above work will be carried out between now and November 1.

The Foundation-stone was laid on Monday with the Masonic honours of a new parish church at Skelmersdale, near Liverpool. The building will be in the Late Perpendicular style and will consist of nave, north and south aisles, a chapel on the ground floor of the tower, and the necessary vestries, parish-rooms, &c. The total cost is estimated at 9,000*l.* and towards this amount 5,000*l.* has been raised. The designs have been prepared by Messrs. Austin & Paley, Lancaster. Messrs. J. Thoms & Sons, Lancaster, are the general contractors.

The Committee appointed to consider the choice of a site for the proposed Federal capital of Australia are in favour of the town of Tumut, which is 264 miles south-west of Sydney.

Sir William Agnew has presented to the National Gallery Sir Joshua Reynolds's portrait of Mrs. Hartley and her child known as "The Nymph and Young Bacchus," which is regarded by many as one of the painter's finest works. It will be remembered that some years ago Sir William presented "The Harbour of Refuge," by Fred Walker, to the same gallery.

The London County Council have decided to appropriate at a cost of 30,000*l.*, a site in Southampton Row for the proposed London Day Training College. The site is next to the already allocated for the Central School of Arts and Crafts.

The Additions to the palace at Laeken for the King of the Belgians, which M. G. Girault is carrying out, comprise besides the apartments for the monarch, a chapel, riding school, stables and coachhouses, all of which are on a large scale. Although the work was not commenced until six months ago, the buildings will be roofed before the winter and completed in spring.

We have Received with regret the announcement of the death, which took place on the 15th inst., of Mr. J. S. Stevens of Poundfield, Old Woking, senior partner in the old established firm of Archibald Smith & Stevens, of "Janu Works," Queen's Road, Battersea. No changes, we understand, will be made in connection with the business, which will be conducted as heretofore by the surviving partners.

The Royal Architectural Museum has now been acquired by the Architectural Association, and will be reopened to the public about April next, by which time the necessary alterations will be completed.

The Newport Chamber of Commerce has issued the year book of that thriving town. It contains illustrations of buildings, maps, &c. The statistics are abundant. From the pages the reader will be able to realise the condition of Newport and its future as a centre of industry and commerce.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

ACTON.—Plans are invited for a school for 250 boys to be erected at Acton. The architect whose plans are selected as first will be asked to carry out the work at a commission of 5 per cent. The second set of plans will receive a premium of 30%, and the third set of plans 20%. Mr. B. S. Gott, clerk of the Governors, Guildhall, Westminster.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100%, 50% and 30% respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

CONTRACTS OPEN.

AMBLE.—July 27.—For new shop front and alterations to post office. Mr. J. Wightman Douglas, architect, 1 St. Nicholas Buildings, Newcastle-on-Tyne.

BACUP.—Aug. 12.—For the erection of an infants' school in Lanehead Lane, Bacup. Messrs. Smith & Cross, architects, Town Hall Chambers, Rochdale.

BEIGHTON.—For the erection of business premises at Beighton. Mr. G. Platts, manager, Central Stores, Woodhouse.

BOW BRIDGE.—July 28.—For rebuilding a portion of the relief arch, building two buttresses and other work at Bow Bridge, Devon. Mr. H. Michelmores, clerk to County Council, the Castle, Exeter.

BRADFORD.—For pulling-down and rebuilding front of Elephant and Castle hotel, Westgate. Mr. John Jackson, architect, Barry Street, Bradford.

BRIDGEND.—Aug. 7.—For the erection of an infirmary block, casual wards and porter's lodge at the workhouse. Mr. P. J. Thomas, architect, Bridgend.

BRIDGWATER.—July 29.—For the extension of infants' cloak-room and lavatory at the Albert Street Board school. Messrs. Samson & Cottam, architects, 43 and 45 High Street Bridgwater.

BUILDING AND BUILDERS.

A NEW Primitive Methodist church is being built at Heacham, near Hunstanton, and a member of the Anglican Church is giving the whole of the bricks, of the estimated value of 500*l*.

EAGLE parish church, Notts, which, it appears, has got into a terrible state of dilapidation, is to be restored at a cost of 2,000*l*, under the supervision of Mr. J. T. Lee, F.R.I.B.A.

THE memorial-stone of a new chancel, which is being erected in St Martin's Church, Brighouse, has been laid by Mrs. K. Aspinall. The alterations will cost about 4,000*l*, and towards the amount an anonymous donation of 1,000*l*. has been received.

THE Auchterarder Town Council has accepted the offer of Messrs Mitchell & Sons, contractors, Dundee, to carry out the drainage and sewage purification works for the burgh from plans and specifications prepared by Mr. William Allan Carter, C.E., Edinburgh, at an estimated cost of 5,065*l*. 17*s*. 9*d*.

THE memorial-stone of a new infants' day-school in connection with St. Edward's Catholic schools, Runcorn, was laid on Sunday afternoon. The new school which is in course of erection from the designs of Mr. Kirby, of Liverpool, will provide accommodation for 130 children, and will be in accordance with the latest requirements of the Board of Education. The building adjoins the old school, and a new playground is being enclosed round the two schools. The total cost will be about 2,000*l*.

At a special meeting of the Northern District committee of the County Council of Ayrshire at Kilwinning the question of extending and combining the waterworks of Kilbirnie and Glengarnock was under consideration. A sub-committee recommended that the scheme be proceeded with at a cost of from 21,500*l*. to 25,000*l*. A petition was presented against the proposal, signed by 374 persons in Glengarnock, while parties appeared and stated their objections on behalf of two large works there. By fourteen votes to three it was agreed to proceed with the extension.

At a meeting of the Workmen's National Housing Council, held on Monday evening at No. 7 St. Bride Street, E.C., with Mr. W. C. Steadman, L.C.C., in the chair, Mr. Gilbert moved a resolution cordially welcoming the candidature of Alderman Fred Knee, their secretary, as a Labour candidate for the Parliamentary Division of Clapham, and instructing the executive council to arrange a national appeal for funds to fight the election. Mr. Newland seconded the resolution, which was carried. Mr. Steadman expressed the hope that at the next general election of the London County Council Mr. Knee might be elected a member. Another resolution was moved by Alderman Dew to the effect that the Council should press on the London County Council and other local bodies that they should demand greater facilities and support from Parliament, rather than attempt to warehouse the people, and that municipal efforts should be directed to supplying better accommodation for less rent rather than less accommodation for higher rent.

THE new school which is to be erected by the Edinburgh School Board at Albion Road (off Easter Road) will be situated upon ground belonging to the Trinity hospital, extending to about an acre and a quarter. A three storey building, the school will give accommodation for about 1,400 children in two departments. The ground floor will be devoted to infants, and the upper floors to juveniles. A central hall, 58 feet by 30, will be provided for each department, and the classrooms, which will be placed on either side of it, will vary in size from that accommodating forty-five children to that accommodating seventy-three. A workshop will be erected in the boys' playground. The style of the new school, which has been designed by Mr. Carfrae, architect, will be the very simplest treatment of Renaissance, there being an absence of any elaborate architectural detail. Building operations cannot be commenced until the autumn, and it is hoped that occupation will be obtained on January 1, 1905.

Main Entrance

213-204 TOTTENHAM COURT RD., LONDON, W.

Opposite Goodge Street.

THE foundation of the new church, or chapel of ease, that is to be erected just below the vicarage at Churchdown, Gloucestershire, was laid on the 15th inst. The architect's drawings and model, which were exhibited in the Vicarage grounds, show that the church when completed will consist of a nave and choir 84 feet by 28 feet, sacarium 18 feet by 13 feet, north and south aisles 29 feet by 19 feet each, morning chapel 20 feet by 14 feet, vestries for choir and clergy, with organ-chamber over the former. The church, when completed, will accommodate about 460 sittings, and in the portion at present being built, viz. nave, choir and sacarium, about 316 sittings. The building is being erected with stone from the Painswick quarries, and the roofs will be boarded internally and covered with Broseley tiles, and the elevations are a simple treatment of Early English character. The amount of the builder's tender for the portion now being erected is 2,553*l.*, to which will have to be added the cost of lighting, heating, temporary vestries, boundary fences, architect's commission, &c., which will probably bring the total expenditure up to 3,000*l.* or thereabouts before all is completed.

DRAWINGS were prepared by Mr. Fred T. Beck, architect and diocesan surveyor, of Wolverhampton, for the rebuilding of the parish church of St. Thomas, Wednesfield, which was destroyed by fire some eighteen months ago, and the contract was placed in the hands of Messrs. H. Willcock, of Wolverhampton. The whole of the sacred edifice has been rebuilt, except the main walls of the nave and the tower at the west end, which have been repaired and pointed, and new balustraded parapets have been erected. The opportunity has also been taken for the enlargement of the church by the addition of a chancel sufficiently spacious to accommodate the choir and clergy, seats for whom were formerly in the nave. The organ-chamber has also been enlarged, vestries for the choir and clergy have been provided, and a semicircular apse, forming the sanctuary, has also been added at the east end. The building is constructed of brick with stone dressings, and the roofs covered with slates, the windows being glazed with ambetti glass throughout except those in the sanctuary, where the old stained glass which was saved from the fire has been utilised. The clock, which was entirely destroyed, has been replaced by a new one, and the bell has been recast. Internally the church has been remodelled in many respects, although the gallery system has been retained. The ceiling, which was formerly flat, is now arched in three spans. The galleries and roof are supported on rolled-steel stanchions. An

oak balustrading forms the gallery front, which terminates at the eastern end of the nave with curved returns, thus forming a good clear open space before the pulpit and organ-chamber. The choir and clergy stalls and pulpit are executed in fumed oak, and the seating throughout the remainder of the church in pitch-pine. A font, executed in Hollington stone, has been placed near the west end. The total cost of the whole of the works is about 5,000*l.* The church will shortly be reopened.

ELECTRIC NOTES.

THE Felixstowe District Council have resolved to purchase the existing works of the Electricity Supply Company, and to apply to the Local Government Board for a loan of 17,160*l.* for that purpose.

ALL the plans have now been prepared, and are under the consideration of the Admiralty authorities, for the electric installations at the dockyards provided for in this year's Navy estimates. The installations will be not only for lighting purposes, but will entirely displace steam as the motive power for all machinery and plant in the Royal dockyards. The necessary tenders are expected to be invited in a month or so, but meanwhile some progress with the work has already been made at Chatham.

TRADE NOTES.

MESSRS WM. POTTS & SONS, clock manufacturers, Leeds, have just completed a new illuminated turret clock at the Victoria Mansions, Hull, for Sir W. H. Gelder and Mr. Kitchen, architects, Lowgate, Hull, and another at Messrs. Powolmy's new restaurant, King Edward Street, Hull, for Messrs. A. Neill & Son, architects, Leeds.

WE are glad to observe that Mr. G. W. Riley, F.R.H.S., of Villa Rustica, Norwood Road, Herne Hill, S.E., has been awarded the Banksian medal for his effective display of summer-houses, &c., at the recent Royal Horticultural Society's Exhibition, Holland House, Kensington.

BECKINGHAM church tower, near Gainsborough, is about to be enriched by having a large chiming clock erected upon it. It will have two 6-foot dials, facing south and east. It will

chime the quarters upon two bells and strike the hours upon the largest bell. The work is being carried out to the designs of Lord Grimthorpe by Messrs. John Smith & Sons, Midland Clock Works, Derby.

MR. ROBERT BOYLE, who was the proprietor of over four-fifths of the shares in Robert Boyle & Son, Ltd, ventilating engineers, 64 Holborn Viaduct, London, E.C., and 110 Bothwell Street, Glasgow, asks us to announce that in consequence of his having acquired the remaining shares, the business will in future be carried on by Mr. Boyle under its original title of Robert Boyle & Son.

VARIETIES.

MR. ROBERT J. FITTALL, deputy town clerk of Derby, has been appointed town clerk of Devonport.

SPECIAL arrangements have been made by the Chancery Lane Safe Deposit Company for the temporary safe-keeping of securities during the summer holidays and long vacation.

The new "Leicester Nurses' Home" which, by means of the generosity of the Earl of Leicester, has been added to the Norfolk and Norwich Hospital, was opened on the 16th inst. It has been erected in the English Renaissance style from designs by Messrs. Boardman & Sons, contains eighty bedrooms averaging 12 feet by 10 feet, and provides every comfort for an extensive nursing staff.

THE opening services in connection with the new Congregational chapel at Spencer's Wood, near Reading, were held on the 15th and 16th inst. The building, which with site has cost about 1,900*l.*, consists of a nave with narrow aisles, chancel, vestry, tower porch, store-room and heating chamber. The interior is finished in red brick with cement dado, and the open-timbered roof is supported on large oak posts on hard stone bases. The tower forms a picturesque structure and provision is made in it for access to a small gallery to be made at the end of the church when further accommodation is required. Absence of "style" has rather been sought than anything definitely marked, the effort being to produce something very quiet and in harmony with the country. The seating consists of open benches and accommodation is provided for 280 adults, exclusive of a future gallery which will hold 50 persons. The chapel is 63 feet in length and 31 feet in breadth.

The work has been carried out by Mr. Edwin Wheeler, of Spencer's Wood, from the designs and under the supervision of Messrs. Ravenscroft, Son & Morris, architects, Reading.

SANITARY INSTITUTE EXHIBITION.

CONTINUING our remarks on the exhibits at the above, which appeared in our last issue, we now purpose briefly referring to those only which more directly appeal to our readers.

The advantages to be derived from dealing with town refuse by means of refuse destructors are now fully recognised, and may be summed up as the most sanitary and economical method of dealing with it, at the same time generating steam power that may profitably be utilised for many municipal undertakings, such as electric-lighting stations, &c.

Three methods are represented by models showing the different systems. That carried out by the *Horsfall Destructor Co., Ltd.*, we have previously fully described, and the plans and photographs of plants erected by the company testify to the wide area in which they have been installed.

Messrs. Heenan & Froude exhibit a battery of twin-cell destructors, in which all noxious gases travel between highly heated fire-brick reverberatory arches, and are cremated and consumed before they can reach the boilers or chimney obviating any nuisance from smell. The forced draught is supplied by "Heenan" fans, so arranged that the air is extracted from the clinking and tipping floors, thus keeping the building ventilated and drawing any smell to the fire. By the use of hot, dry air only, which absorbs any moisture in the refuse, the necessity of drying hearths is done away with.

Messrs. Meldrum Bros., Ltd., show a model of the top-feed "Simplex" destructor furnace with a water-tube boiler, the furnace forming one continuous cell with the grate in three divisions, charged alternately, so that a part of the grate is always at a very high temperature, insuring the complete combustion of obnoxious fumes.

The collection of house refuse in a speedy and cleanly manner is important, and two methods shown go very far towards solving this. The *Sanitary Bin Co.* supply a D-shaped bin with hinged cover, which is fixed in the passage wall, and so made that the bin cannot be taken out of its place by the tenant, but only drawn into the alley, where it is protected by a

GLOBE ENGINEERING WORKS,
CARDIFF.

hingeless self-locking door, opened by two lifters, that at the same time release the bin, which is carried to and emptied direct into the cart. This bin was awarded a bronze medal.

Sanitaries, Ltd., show Dr. Quines's bin, the contents of which are tipped into a barrow and taken to the cart, otherwise much resembling the above. With the ashbin-stand is combined a cinder sifter, which gained the Society's bronze medal.

Messrs. Cloughton Bros. exhibit of leadwork, including ornamental head for rain-water pipe, ornamental sockets, junctions, &c., is most excellent. In addition are shown the "Niagara" lead-lined syphon cistern and several closet sets.

The Neville Engineering Co., Ltd., make a special feature of iron direction-posts, also Caink's jets and spreader for street watering carts and Caink's sewer ventilators.

The Ames Crosta Sanitary Engineering Co., Ltd., were awarded three bronze medals for Crosta's surface-water gullies, trapped under all conditions, and intercepting all road detritus; for Ames's stoneware conduits for electric cables with ducts for carrying away moisture; and for Ames's trapped drain box for tramway rails, giving free escape of surface water from the rail to the sewer.

Messrs. Slack & Brownlow gained a bronze medal for their germ filter having a preliminary strainer, and had a good display of domestic and pressure filters, including the "Cataract" filter for dealing with large supplies, specially adapted for factories, breweries, hotels, &c.

The Septic Tank Co., Ltd., by their exhibit explain their automatic system of dealing with sewage, which consists of a septic tank for liquifying all solid matter, and their automatic aerating filters.

Messrs. James Stott & Co., who were awarded a bronze medal, exhibit water-heaters for baths at workhouses and public institutions, also heaters for swimming baths, their well-known gas-regulators, ventilators of various forms, air-propellers and a water-driven fan specially designed to ventilate underground conveniences.

Messrs. J. Oakes & Co. had a varied exhibit of glazed stoneware pipes and fittings of excellent quality, and gained a bronze medal.

Messrs. John Hirst & Son's patent sloop shutters, channels and gratings were awarded two bronze medals, and are intended to supersede shallow sloop dishes and other devices for carrying off slops and rain-water. A hopper is partly recessed into the wall, with an inlet for sink waste pipe at the back, and opening to receive water from the exterior of building,

which flows through an open channel fitted with movable grate into the trap. Grates with adjustable openings to receive rain-water and other waste pipes can be supplied or the hopper can by a swan-neck bend discharge direct to trap with channel. The absence of leakage into foundations and the ease with which all parts can be cleansed are certainly advantageous.

Mr. Henry Jackson shows his patent water boiler, and also an improvement—the "Clarus"—designed to overcome furring. This boiler differs from a geyser in that no coils enter into its construction. It gave one gallon of boiling water per minute continuously three minutes after lighting.

Messrs. John R. Fyfe & Co. have a good display of drain-pipes and accessories, chimney-pots, &c.

Messrs. Mathews & Yates exhibited their well-known fans (which obtained the bronze medal) in various forms and for diverse purposes, including electric, steam and belt-driven; also the "Cyclone" air propeller, and their ventilating and electrical specialties.

Mr. A. G. Thornton had a fine display of surveying and drawing instruments.

The Richmond Gas Stove Co. and *Messrs. Wilsons & Mathiesons* and the *Davis Gas Stove Co., Ltd.*, show examples of the respective manufactures in gas stoves, &c.

The Shannon, Ltd., were represented by some of the office labour-saving devices, roll-top desks, letter-filing cabinets, the rapid letter copier, &c.

The Fireproof Plate Wall Co. were the only firm showing constructional work—Bruckner's patented system of fireproof partitions and wall, floor and ceiling plates for lining interiors of buildings for fireproofing and sound-deadening.

Messrs. W. Summerscales & Sons, Ltd., had a prominent space reserved, but it was occupied by a notice only that they were too busy to send an exhibit, and inviting the delegates to call at their works and see their laundry machinery in course of manufacture. An enviable position for any firm, and one that speaks well for the reputation of their machinery.

Thomas Harrison, Ltd., showed how by the use of the "Cyclo" large areas of wall space may be expeditiously and thoroughly whitewashed by a hand machine.

The British Sanitary Co. were again awarded the Society's silver medal for self-acting earth closets, of which numerous styles were shown, from those in highly-finished polished oak to the plainer, made specially strong for public works, &c.

The remaining exhibits must remain over, but we may probably refer to some of them later.

DEATH OF MR. B. E. NIGHTINGALE.

It is with sincere regret that we have to announce the decease of one of London's well-known builders and contractors in the person of Benjamin Ebenezer Nightingale, of Albert Works, Albert Embankment, Lambeth, S E., who passed away on the 17th inst. at Richmond, at the somewhat early age of sixty-six, and whose interment took place at Norwood cemetery at noon

on the 22nd inst. The business of the late Mr. Nightingale is being carried on without any interruption by his sons, who have for years taken the active share in the management. The deceased had a long, uninterrupted, active and important building and contracting business throughout the past forty-eight

years, during which time he has carried it on in the parish of Lambeth, and for the last forty-one years at Albert Works, Albert Embankment. Mr. Nightingale was President of the Master Builders' Benevolent Institution, member of the London Master Builders' Association, freeman of the City of London, member of the Bricklayers and Tilers' Guild and the National Liberal Club.

Amongst the many and important buildings which have been erected by the deceased for eminent architects of his day may be mentioned the Council Chambers, Guildhall, and Leadenhall Market, from the designs of the late Sir Horace Jones; churches and St Olave's rectory, from the designs of the late Ewan Christian; monasteries and church from designs by the late John Bentley; the Stationers' Hall chapel at the Consumptive Hospital, centenary hall at the Royal Masonic Institute for Girls, from the designs by the late Ebenezer Greig and the late Mr. P'Anson. Also buildings from the designs of Sir John Taylor, Mr. Aston Webb, R.A., and Mr. R. Fabian Russell, and of many other eminent and distinguished architects.

FOR the convenience of holiday makers on the Continent cheap tickets will be issued to Brussels, available for eight days, *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning. For visiting The Hague, Amsterdam and other parts of Holland, the Rhine North and South Germany, and Bale, for Switzerland, special facilities are offered *via* the Great Eastern Railway Company's Royal British Mail Harwich-Hook of Holland route, through carriages and restaurant cars being run to Berlin, Cologne and Bale. The General Steam Navigation Company's fast passenger steamers will leave Harwich for Hamburg on July 29 and August 1, returning August 2 and 5. The United Steamship Company of Copenhagen steamers will leave Harwich for Esbjerg (on the west coast of Denmark) as usual.

A SYNDICATE has been formed to supply Kirkcaldy with swimming and other baths. Plans have been prepared for the building by Mr. J. D. Swanston, architect. The estimated cost is from 10,000*l.* to 12,000*l.*, and the site proposed is at the corner of Tolbooth Street and Sands Road. Recreation rooms, billiard and reading-rooms and a well-equipped gymnasium will be included in the building. The want of public baths has been long felt in Kirkcaldy.

THE "TIP-UP" WASH BASIN.

THE "Tip-up" basin so universally adopted in buildings of all classes, from royal palaces and mansions of the nobility to the working-man's club and institute, is due to the inventive genius of that pioneer of sanitary improvement, the late Mr. Geo. Jennings.

Various improvements have from time to time been effected in construction, and amongst them may be mentioned the facility offered for the removal of the basin in order to cleanse the receiver underneath, but this has not altogether satisfied the whims and caprices of certain extreme faddists, who maintain that there are people who will not take the trouble to remove the basin to cleanse this receptacle. To meet their views, his successors (who follow so worthily in his footsteps) have introduced an important improvement in the design of the receiver, which prevents the pollution of the whole surface, renders the removal of the basin unnecessary and the portion

affected is readily cleaned without trouble. This improvement is a notable one, as the contents of the basin are discharged instantaneously, leaving no sediment round the sides, and leaving no valve liable to derangement it is practically everlasting.

ing as regards durability, and is simple and efficient in action. Its adoption by H.M. the King for his private use in the royal palace augurs well for its continued success, and sanitary scientists should take an early opportunity of inspecting the arrangement at Messrs. Jennings's well-appointed showrooms in the Lambeth Palace Road, where this and many other novelties of a sanitary nature are to be seen.

BUILDING MATERIALS IN SOUTH AFRICA.

In response to an inquiry as to the nature of the demand for building material in South Africa, the Board of Trade have received from Mr. Henry Birchenough, who recently visited that country as British Trade Commissioner, a short report on the subject, from which the following has been taken:—The demand for building material of all kinds is very active, not only in Cape Colony, but in all the South African colonies at the present time. A great impulse has lately been given to the sanitation of towns, so that a large and sustained demand for sanitary pipes may be expected, especially as the substitution of water-closets for earth-closets is gradually effected. The city of Johannesburg is just embarking upon an expenditure of 500,000*l.* for drainage purposes, of which it is expected that 100,000*l.* will be spent in pipes. When it is carried out there will be all the service connection with the houses to be made, which will involve a further large demand. Speaking generally, adds Mr. Birchenough, the present time is very favourable for any attempt to get into the trade in building materials in South Africa, as the demand is large and stocks are not yet replenished. Details as to prices could only be obtained on the spot, but it is believed they are remunerative to all those engaged in the trade. All high-priced goods—that is, high priced on this side—should be avoided.

THE MAUGHAN AUTO-GEYSER.

A NEW and very convenient apparatus for the supply of hot water for bath and domestic purposes is being introduced by Maughan's Patent Geyser Company, Ltd., the strong point of which is that it is entirely automatic in its action, so that when hot water is required it is only necessary to turn on the tap, whether over bath, lavatory or sink, when the auto-geyser at

Telephone 680 Hop.

once supplies hot water until the tap is closed, when the cold water and gas supplied are automatically shut off.

The auto-geyser can be fitted in any part of the house above the taps to be supplied; the drawing of hot water allows cold water to enter by means of a ball valve, the movement of this opens the gas supply, and the gas is lit by the pilot jet. The "Maughan" being an instantaneous heater, by the time the incoming water has passed through it is heated. When the hot-water tap is shut the lower chamber of the auto-geyser fills and the ball valve shuts off the cold water, while the gas valve is released and falls by its own weight.

A notable feature of the "Maughan" auto-geyser is the absence of rubber or leather diaphragms or tubes in the mechanism. With the exception of the rubber seating of the ball valve (which is easily renewed if worn), the whole of the automatic arrangements are of copper or brass.

BROAD FLANGES IN STANCHIONS.

THE determination of the best form of steel columns stanchions is generally a difficult operation for the architect engineer. Generally it is supposed that it is prudent to dispose the material as far from the neutral axis as is possible. But the breadth of the sides or faces should also be taken in account, and thus we find cases of a web plate and angles strengthened by wide channels or thick plates. The load does not always act in a perpendicular direction that is mathematically true, and for oblique thrusts wide sides have advantage. The subject merits investigation. The following table showing the economic value of Differdange beams in comparison with ordinary sections will interest our readers:

Section. Inches.	Weight per Foot. Lbs.	Lesser Moment of Inertia.	Economic Value. Moment of Inertia ÷ weight per ft.	Ratio of Economic Values.		Comparative Load 7½ tons on 14-ft. Str. Tons.
				9-inch by 7-inch Joist.	Differ- dange Beams.	
9 by 7	58	46'300	7985	—	—	41'7
8½ by 8½	44	53'228	1'210	100	151'5	48'0
9½ by 9½	51	73'032	1'465	100	183'5	65'4

The above figures show that both sections of Differdange beams are lighter and stronger than 9-inch by 7-inch British standard joist, the 8½-inch by 8½-inch being over 52 per cent more economical, and the 9½-inch by 9½-inch 183 per cent more economical. Differdange beam 10-inch by 10-inch 55 4 lbs. shows a similar superiority over British standard joist 10-inch by 8-inch by 70 lbs.

UNDERGROUND BAKEHOUSES.

A PAPER on "Requirements in regard to Underground Bakehouses" was read by Dr. T. L. N. Barlow, medical officer of health, Bootle, at the Liverpool Health Congress. He pointed out that quite lately the Home Secretary had declared that it was the deliberate intention of the Government to close underground bakehouses, and he had moreover refused to consider the question of compensation. In Bootle two-thirds of all the bakehouses were underground—twenty-two out of thirty-three about half of those were distinctly bad as regards light, ventilation and sanitation generally, and most of them could not with any reasonable amount of alterations be made suitable and they would, therefore, he presumed, be closed. As to the remainder, when the advantages and disadvantages of ea-

were weighed up, there was not much to choose between any of them. To close all these would entail much hardship upon the bakers, and would also cause much inconvenience to a large number of people. The standard requirements were in every way admirable, but each bakehouse would have to be considered on its own merits when application was made for the necessary certificate. He did not think it would be possible to draw a hard and fast line with regard to the minimum height of underground bakehouses, and he personally should be inclined to allow a less height than that if the ceiling of the bakehouse were some little distance above the level of the ground adjoining, and to adopt a more stringent view in respect to the height of the bakehouse where entirely underground. There could be no doubt that many underground bakehouses, although not in themselves unsuitable, were made so by reason of the utter carelessness and neglect of the occupiers, some of whom had no idea of cleanliness, and looked upon the bakehouse as a fit place for the storage of any filth. In his opinion it would have been of great advantage if power had been given by the Act to the sanitary authorities to revoke the certificate of suitability if the occupier of any underground bakehouse persistently neglected to keep the premises in a cleanly condition, or allowed them to fall below the standard requirements in other respects. The paper also alluded to the great difficulties that would be experienced in dealing with underground bakehouses in view of the long notice—2½ years—given in the Act before the closing of these places should be enforced.

Dr. Marsden said that probably in a few years they would see an Act of Parliament for the total abolition of underground bakehouses, and it would be very hard to cause owners to spend large sums of money at the present time.

ELECTRIC POWER FOR MINES.

WE understand that the Park and Croesor Slate Quarries, of Penrhyn-y-deudraeth, North Wales, are now putting down electrical plant for supplying power throughout their quarries. The generating plant consists of a 250-kilovolt ampere three-phase generator, direct coupled to a hydraulic turbine, capable of giving 2,750 volts at 40 cycles when running at a speed of 600 revolutions per minute. A somewhat novel feature for this country is the special form of flexible coupling which is used to connect the three-phase generator shaft to the shaft of the

hydraulic turbine. In order to render the plant as automatic in action as possible special attention has been paid to the turbine governing apparatus, which is of the spear type. A Thury regulator is being installed in order to maintain a practically constant voltage with varying load. The two exciters are driven by a separate turbine, and are so arranged that either one or other machine can be used for excitation purposes as required. The transmission line consists of bare copper over-head conductors, carried on wooden poles, a high-tension cable connection being used for supplying the current required in the quarries tunnel. The line voltage is 2,750, this voltage being reduced down by means of transformers of 220 volts for the motor circuits.

There are six motors to be installed in the mill, each of these motors being capable of giving 10 brake horse-power at a speed of 570 revolutions. A centrifugal pump direct-coupled to a three-phase motor is being installed for draining purposes, and the winding gear, which was formerly driven by means of a steam-engine, is now being arranged to be driven electrically. For this latter purpose, a three-phase motor with starting and reversing gear is being installed, the gear being so arranged that, in the event of current being cut off from the winding motor, the electric brakes are immediately applied, thus preventing any accident due to failure of the electrical supply. An electric locomotive will be provided, the continuous current for this purpose being supplied at a pressure of 500 volts by a motor generator situated in the mine itself.

The whole of the contract for the electrical work has been placed with Messrs. Witting, Eborall & Co., of Temple Bar House, while the turbines are being supplied by Messrs. Gilbert Gilkes.

THE HOLYROOD DRAINS.

THE following correspondence relating to the sanitary arrangements of Holyrood Palace, which caused Lord Leven and Melville to take up his quarters at the North British Hotel during this year's sittings of the General Assembly of the Church of Scotland, has been published. The first is a letter from Mr. W. W. Robertson, of H.M. Board of Works, Edinburgh, dated October 22, 1902, to Sir Schomberg M'Donnell, stating that in accordance with his instructions he had made a thorough examination of the various sanitary arrangements at Holyrood Palace, and enclosed a detailed report with rela-

tive plans. In this report Mr. Robertson enters into minute details, and in order to make his report as clear as possible, shows in parallel columns the "present arrangements" and the "proposed arrangements." What followed upon this report is thus told in the papers, the papers marked * not having been seen by the Earl of Leven and Melville until after the correspondence had been closed:—

**Memorandum by Professor Corfield, M.D., Consulting Sanitary Adviser to H.M. Office of Works*

I have read the report referred to in the foregoing memorandum, and am of opinion that the condition of things described in that report is such that Holyrood Palace ought not to be occupied by His Majesty, even for the shortest period, until the sanitary arrangements have been thoroughly reorganised. This will take a considerable time, and in view of the fact that, as I am informed, the High Commissioner must occupy the palace in April and May next, could not well be commenced until the month of June, and would certainly not be finished before the end of the year, if even then.—W. H. CORFIELD.

19 Savile Row: November 12, 1902.

**Secretary, H.M. Office of Works to Principal Architect in Scotland.*

Mr. Robertson,—Probably the best plan would be to commence work immediately after the visit of the High Commissioner is over; but there is an objection, viz. that it would not be possible to finish the work before the visit of the King, which will probably take place in August. If you began the work directly after the visit of the King in August, I imagine that it could be completed before March 31, 1904.—S. M'DONNELL.

October 23, 1902.

**Principal Architect in Scotland to Sir Schomberg M'Donnell.*

Secretary,—If the work is begun after the visit of the King in August, it might be finished before March 31, 1904.

October 26, 1902.

W. W. ROBERTSON.

Sir Schomberg M'Donnell to the Earl of Leven and Melville.

My dear Leven,—Windsor tells me that you are anxious to know the precise position as regards the sanitary works at

Holyrood before you go abroad to-morrow. Let me say once that you need not be in any way concerned. The works will not be begun until after the King has paid his visit to Edinburgh, and at present we do not propose to touch them until the third week in next August or thereabouts. As regards the present condition of the drains, I think that though they are far from being perfect or up-to-date, there is no danger to be apprehended to yourself or your household. It would, however, be a very different matter to have the King and Queen staying there with a huge Court. Under such conditions existing system of drainage would be quite inadequate. I hope this will set your mind at rest. In any case, we should do nothing whatever which would inconvenience you as High Commissioner.—Yours very truly,

March 18, 1903.

SCHOMBERG K. M'DONNELL

The Earl of Leven and Melville to Sir S. M'Donnell.

Windsor promised that I should see the report on the drains, &c., at Holyrood. Please send it to me at Hôtel des Îles d'Or, Hyères, as soon as possible. Please, too, tell me what was done in examination of drains. I am very anxious about them. We are a huge number of people. I believe a palace, except the Queen's rooms, is full during our stay. The drains have been in any way touched please let me know. The King, I believe, will not go to Holyrood, though he may go to Edinburgh. Please let me hear at once; I am disappointed not to have the report to-night. I can make no arrangements in contracts until I have it. We start early to-morrow.—Yours truly,

LEVEN AND MELVILLE.

Roehampton: March 18, 1903.

The Earl of Leven and Melville to Sir Schomberg M'Donnell.

One line before I leave England to beg again that you do not fail to send me at once the full report on Holyrood drains, which made you decline to be responsible for the King's going there; and please tell me precisely what has been done in examination of the drains—and since. Were they tested by water test, or smoke, or in what way? and were they, or any part of them, opened out, tapped, or moved? Is there any connection with large sewers, or do they drain into a cesspool? In short, please tell me all about it. My responsibility is one way as heavy as yours, and the number of people I take there is very large. Windsor promised me full information—it is only right I should have it. If the drains are safe nobility will be more pleased than me, but unless I am allowed to know

about them, I must go to an hotel for the General assembly. Just off to Hôtel des Iles d'Or.—Ever yours,
LEVEN AND MELVILLE.
Please send it at once, I have many important arrangements, contracts, &c., dependent upon it.
Rochampton: March 19, 1903.
(Copy)

The Earl of Leven and Melville to Lord Windsor.
Dear Windsor,—Please see that the report on Holyrood drains and full information as to what has been done to them is sent to me here at once. I had a note from M'Donnell, who, instead of sending me particulars and the report which forbids the King's going there, merely gives me his opinion that I have nothing to fear. No doubt he is sincere, but he may be mistaken. I cannot risk it, especially as he himself told me in October that they were very bad indeed. I take a large number of people to Holyrood—seventy or eighty at least. The water-closet is practically in our bedroom. I want (1) the report which made M'Donnell speak of the drains as being very bad; (2) to know if they have been tested; if so, how? whether by smoke or water, or in what other way? (3) whether any of the drains or pipes have been in any way disturbed since I was at Holyrood last May? (4) whether there is any communication with any large sewer? (5) or whether it is all gained into a cesspool? and, if so, where that cesspool is, and whether it has been disturbed in any way? I wrote from Rochampton to M'Donnell on the 18th and again on the 19th to emphasise the importance of sending me these particulars at once. This is the 22nd and I have nothing on the subject. I have to make large contracts and important arrangements for putting up some 70 or 80 people (I think) in the palace, as well as for dinners of 100 or 150 almost every night. This cannot be done in a short time. It is already very late. I am sure you will see the necessity of sending me all possible information without delay. I have written to Kenneth Mackenzie, who is purse-bearer and manages all the contracts, to do nothing till he hears from me. It is too important a matter to leave to M'Donnell's private opinion. The drains were, I think, all right last year. Have they been in any way disturbed? If so, how? I do beg you to send me full particulars without delay.—Sincerely yours,
LEVEN AND MELVILLE.
Will any reliable sanitary authority guarantee the drains as safe for me and my guests and household?
Grand Hotel, Hyères: March 22, 1903.

Sir Schomberg M'Donnell to the Earl of Leven and Melville.
March 27, 1903.
My dear Leven,—Here is the report on the Holyrood drains. I cannot send you the plans, as we want them here, but no doubt the report will be sufficient for your purpose. If you want an independent opinion upon the sanitary condition of the house and its safety I think you would find that Mr. Alexander Welch, of the Sanitary Protection Association, Edinburgh, is the best man. He drained three large houses for the Duke of Buccleuch.
Had you let me know four weeks ago that you wanted to see this report I would have gone all through it with you with the plans before you went abroad.—Yours very truly,
SCHOMBERG K. M'DONNELL.

** Sir Schomberg M'Donnell to Principal Architect in Scotland.*
Mr. Robertson,—Sir Kenneth Mackenzie called here today. I have arranged with him that an inspection shall be made by an independent sanitary surveyor (probably Mr. Welch) on behalf of the Lord High Commissioner, in order to determine whether it is safe for him to occupy the palace. Please assist him in every way.
S. M'DONNELL.
March 27, 1903.

** Principal Architect in Scotland to Sir Schomberg M'Donnell.*
Secretary,—Sir Kenneth Mackenzie called in Sir Henry Littlejohn. I showed him the drainage plan and went with him in detail over the report of the survey which I submitted to the Board last October. I afterwards visited the palace with him and accompanied him in his inspection. I was careful to point out all known defects to him. He has furnished a report to Sir Kenneth Mackenzie, and as I have been allowed to see it I append a copy for the Board's information.
April 1, 1903. W. W. ROBERTSON.

Sir Henry Littlejohn's Report.
I beg to report that I this day, Tuesday, March 31, accompanied by Mr. Robertson, of His Majesty's Office of Works, examined the sanitary condition of the Royal Palace of Holyrood. I previously went carefully over the plans of the existing drainage, and while these in some respects do not represent the advanced views of the present day as to domestic drain-

age, the drains themselves are in good working order and perfectly sweet. The sanitary conveniences I found in an excellent state of repair and cleanliness. I tested them—especially those in the apartments to be occupied by His Grace the Lord High Commissioner—and I have no hesitation in declaring them in good working order and free from the slightest taint. Applying my long experience as a sanitary official to this royal residence, I beg to certify that I have never examined any mansion in a sounder sanitary condition or one more fit for the healthy residence of a large establishment.

(Signed) HENRY D. LITTLEJOHN, Knt, M D,
medical officer of health for Edinburgh, professor in the University,
and medical adviser to the Local Government Board.

The Earl of Leven and Melville to Lord Windsor.

My dear Windsor,—I received three days ago your telegram saying "Extracts of Holyrood Report shall be sent at once." Thanks for the intention, but no word on the subject has reached me.—Yours sincerely,

LEVEN AND MELVILLE.

My great desire is to know whether the drains have been tested or meddled with since last year. If they have I should not like to risk living there with my wife and a large number of people, unless some well-known and reliable sanitary expert will guarantee them safe.

March 28, 1903.

The Earl of Leven and Melville to Sir Schomberg M'Donnell.

I have received the report on Holyrood drains; there is no time now for inspection, and I am writing to Kenneth Mackenzie that with rubble drains imperfectly jointed, with a flat bottom liable to be very quickly choked, and w.c.'s in bedrooms, there must be danger. You do not answer my question as to whether the drains have been disturbed; but it appears to me from the report that they must have been in order to see that they were imperfectly jointed, &c.—Truly yours,

LEVEN AND MELVILLE.

I could not have come sooner than I did, being forbidden by the doctor to travel. I saw Windsor the morning I arrived in London. I do not think any inspection or smoke test would make the palace safe.

Grand Hotel, Hyères: March 30, 1903.

(Enclosure in note of April 6, 1903, from Sir Kenneth Mackenzie to Lord Windsor.)

The Earl of Leven and Melville to Lord Windsor.

My dear Windsor,—I have now received a copy of the report of the drains of Holyrood. In view of the fact that the drains are as reported, defective, easily and quickly choked, with a public sewer at one end and w.c.'s practically in the bedrooms of the palace, I cannot live there. My best thanks to you for the information. I cannot say how much I regret the necessity of going elsewhere.—Sincerely yours,

LEVEN AND MELVILLE.

Grand Hotel, Hyères: March 30, 1903.

Sir Schomberg M'Donnell to the Earl of Leven and Melville.

My dear Leven,—By now you will have received Sir Henry Littlejohn's report on the drains at Holyrood. You will see that he considers it quite safe for you to go there. Now that you have the advice of this independent expert, the decision, of course, rests entirely upon yourself. We should naturally prefer that you should be guided by him rather than by common people.—Yours ever,

SCHOMBERG K. M'DONNELL.

Sir Kenneth Mackenzie to Lord Windsor.

10 Moray Place, Edinburgh: April 6, 1903.

Sir Kenneth Mackenzie presents his compliments to Lord Windsor and begs to explain that the accompanying letter from Lord Leven was held up till he should hear again after sending a report on Holyrood Palace from the medical officer of health. That report appeared to him to be sufficiently satisfactory, but he hears to-day that Lord Leven is not disposed to incur a risk.

The Earl of Leven and Melville to Sir Schomberg M'Donnell.

Yours of the 3rd has reached me here, and you will probably have heard from Kenneth Mackenzie that I could not, after reading the report of the drains, take my wife and a crowd of people to Holyrood. It is a great loss to us, to say nothing of the inconvenience.—Truly yours,

LEVEN AND MELVILLE.

THE WEEK.

WE referred lately to the action taken against the Borough Council of Paddington for setting up a hoarding which would prevent the plaintiff, Mr. BOYD, from having a view of an open space in charge of the defendants. There was some friction between the parties. It was alleged that the plaintiff who was erecting flats on one side of the open space had agreed to open a passage 30 feet wide, which would enable the public to have access to the gardens that were transformed from the disused burial-ground of St. Mary, Paddington. As an effectual means to secure that end the Borough Council erected the hoarding, and the plaintiff's tenants in consequence were deprived of the view from the windows on which they had calculated. Mr. Justice BUCKLEY gave judgment for the defendants. But the Court of Appeal came to the conclusion that the plaintiff was entitled to an injunction which would restrain the Council from dealing with the garden in any other way than was prescribed by the Metropolis Local Spaces Act of 1881, and especially that nothing should be done to interfere with the access of light to the plaintiff's windows. This judgment is of importance, for it defines the power of local bodies in respect to properties. If the ownership of the ground was with an ordinary individual it would be presumably allowable to erect a hoarding or other structure on the land regardless of the inconvenience which the plaintiff and his tenants might suffer. The lights were not ancient, and seemingly there were no easements of any kind over the ground. But when land is acquired by a public body for a definite purpose there must be no departure from what was contemplated. At the same time there should be hesitation in giving an opinion on the subject which would appear to be contrary to the judgment of so eminent a lawyer as Mr. Justice BUCKLEY.

THE subject assigned this year by the Academy of Fine Arts for the Prix de Rome in architecture offered greater variety than usual. It was a public place in a great city. According to the regulations there was to be on one side a long and wide avenue, and among the buildings to be introduced were a bourse, a military club-house and a palace for art exhibitions. The competitors took advantage of so exceptional an opportunity, and a vast number of architectural forms were seen. The first prize has been awarded to M. LÉON JAUSSELY, a native of Toulouse, born in 1875, pupil of MM. DAUMET and ESQUIÉ; the second prize was won by M. JEAN WIELHORSKI, of Nancy, born in 1874; and the third prize by M. HENRI JOULIE, of Valence, born in 1877 at Valence. The grand prize for sculpture was awarded to M. EUGÈNE PERON, pupil of M. ARRIAS, the second prize to M. JULES BOUDIER, pupil of L. THOMAS, and the third to M. MARCEL GAUMONT, pupil of M. BARRIAS.

THE payment for making up new roads in front of building estates leads to a large amount of litigation. A curious case of the kind was heard last week in the Court of Appeal. The Rev. JOHN WOOD TODD widened a roadway in Bromley in order that his property on one side might be used as building sites. Mr. MOORE, who owned property on the other side of the road, agreed to contribute 20% towards the expenses. But it was stipulated in the deed that "his heirs, or assigns, or his or their tenants, shall not be under any liability to contribute to the maintenance or repair of the said roadway and sewer and main drain, or any works connected therewith, but on the contrary the same and every part thereof shall be wholly and solely maintained by the said J. W. TODD, his heirs, executors, administrators, or assigns, unless and until the same shall be taken to by the parish or some other local or public authority." That was in 1888. Thirteen years afterwards the local authority demanded the frontagers make up the road, and on failing, the work was executed and the cost apportioned. Mr. MOORE paid 10%, and sought to recover that sum from

the defendant. Mr. Justice BIGHAM gave judgment for the plaintiff. The defendant appealed, and the judgment in the Court below was reversed. Their lordships thought there was a liability on the part of the defendant, but that the word "contribute" was intended to be limited to contributions for maintenance and repairs which from time to time became necessary for the roadway which had been made by the defendant, and to the expense of which the plaintiff had contributed. The conclusion will surprise many. Their lordships, however, took into consideration the whole deed, and not the particular part abstracted above. It should serve as a warning that when a road is mainly intended to benefit property on one side, extraordinary care should be taken to limit liability in equitable proportions.

OLD London Bridge at the beginning of the eighteenth century consisted of nineteen openings, besides the unused drawbridge. It was 74 feet in breadth, but as the buildings on each side occupied a depth of 27 feet, there was only a roadway of 20 feet clear in the centre for traffic. The houses were not continuous, for about the centre of the bridge a space sufficient for three was left unoccupied, except for a low stone wall with an iron palisade through which views of the shipping and river could be seen. The vacancy was left for the drawbridge, but at the time there was no opening used for ships; any that passed had to strike their masts. The rents of the houses sometimes brought in as much as 3,000*l.* a year. The bridge was always thronged, and was, moreover, dangerous, for there was no division between the carriageway and the footpaths. In 1756 it was necessary to obtain an Act of Parliament in order to facilitate traffic by the removal of the houses. The old bridge lasted until 1823, when arrangements were made for erecting the structure designed by JOHN RENNIE, which is now being widened for the first time. The occupiers of the picturesque houses, like those in an ordinary street, were liable to the payment of tithes. The Act provided that the payments in lieu thereof to the rectors of St. Magnus and St. Olave, Southwark, should be paid henceforth from the Bridge House Estate funds. In addition there were yearly emoluments from surplice fees, Easter offerings, while there were large amounts paid for the maintenance of the poor of the Bridge, who afterwards became chargeable to the two parishes. An inquiry, which has been undertaken by the Bridge House Estates Committee of the Corporation, shows that at least two of these charges, amounting to 418*l.* a year, have been regularly paid since the Act came into operation, and that the sum of 61,272*l.* has been in that way expended. The case is interesting as showing fidelity to an agreement, although the property on which the charges were levied have vanished. This is not, we believe, the only instance in London in which sums continue to be paid as dues, although it is impossible to discover the whereabouts of the properties.

THE Government Bill for amending the law relating to the housing of the working classes, if passed, will remove many of the obstacles which retard improvements. Loans for the purchase of sites need not be repaid in less than eighty years, and loans for buildings in from sixty to eighty years, at the discretion of the Local Government Board. That was the recommendation of the committee on the Repayment of Loans. Corporations and other authorities have advocated that a century should be allowed in the case of land and sixty years for buildings. At present, the term is forty years. Henceforth the whole of the duties under the Acts will be undertaken by the Local Government Board. The procedure for obtaining land will be simplified, and schemes presented by local authorities can be modified by the Local Government Board. Property which is condemned can be dealt with in a very summary manner. The local authority can recover from the owner any excess of cost remaining after the sale of the materials. The local authority, when it takes over property, will have all the powers of a landlord, and can evict tenants who decline to leave. It will also be allowable to arrange parts of buildings as shops, and in that way much convenience to tenants will arise.

EARLY LANDSCAPE ART IN ITALY.

A VISIT to an exhibition of the Royal Academy or of one of the societies in London is enough to reveal to a stranger the affection which Englishmen retain for the representation of their country. In none of the foreign exhibitions is that branch of art so abundantly exemplified. There are some zealots who maintain that Englishmen are better adapted to succeed in it than in figure-painting, and an artist can hardly do justice to genre subjects without some skill in the portrayal of natural scenes.

The pleasure afforded by landscape to the painter as well as to the spectator is so peculiar it is difficult to realise that at any time a similar practice was not in favour. But as far as can be ascertained the ancient Greeks, who for many reasons should be considered the most artistic of all races, did not appreciate their own land as regards its beauty, and were indifferent to representations of it. The Romans, in that respect at least, imitated them, although they had before their eyes landscapes of a more diversified character. In early Christian art we see vine branches bearing grapes, together with birds and other objects derived from the country occasionally executed, but the whole of the paintings are suggestive of life that was found within buildings. If a palm tree was shown it had a symbolic meaning. Clouds were sometimes necessary to give character to scriptural incidents, but they are rigorously conventional. As late as the ninth century the river Jordan was suggested by means of a figure with an urn, which was a common practice with Roman sculptors when it was required to introduce a river. Mr. RUSKIN mentions the case of a monk who would not allow himself the pleasure of gazing from his window on a splendid Alpine scene, and we may be sure the early ascetics were more self-denying. It is not therefore difficult to understand why for so long a period the illuminated manuscripts, although presenting the forms of fruits and flowers, give only unreal and fantastic representations of landscape. It seems as if it were believed that the figure alone deserved attention, and that the earth was unworthy of notice. An engraving of the mosaic in the tribune of St. John Lateran, in Rome, which was the work of JACOBUS TORITI at the close of the thirteenth century, will suggest how far landscape art had advanced at that time. The spectator is supposed to be in the heavens with the saints, and to look down on the Jordan and its banks. The fishes are as large as the fishermen or their boats. Ducks are even larger. The trees are placed standing apart. The scale appears the more remarkable when compared with the colossal figures of the saints. DA VINCI said it was a proof that GIORIO was a country lad, for he began by drawing on the rocks the goats in his charge. Almost instinctively artists in those days symbolised the earth by means of animals of some kind.

The liberties which could be taken in depicting a country scene are apparent in the fresco of the *Triumph of Death* at Pisa, long ascribed to ORCAGNA. Here we see a number of cliffs, but so small that a few animals are sufficient to cover the top of one of them. Two or three hermits near a roadside chapel can hardly find standing room. And yet in the cliffs are openings to the infernal regions. It might be presumed that whoever painted the picture had never stood in the country and could only imagine it from the descriptions given by most inaccurate observers. The pictures of the *Misfortunes of Job*, by VOLTERRA, also at Pisa, show by the difference in treatment between the buildings and the hills how much more familiar artists were with architecture than with the forms of trees or hills. Yet the work could not have been completed earlier than the last quarter of the fourteenth century. Some authorities state that AMBROGIO LORENZETTI about 1337 produced a picture which was considered exceptional for its truth to nature and which is now in Siena. But it cannot be denied that his paintings are more remarkable as curiosities than as masterpieces of art.

According to KUGLER, GOZZOLI seems to have been the first who was captivated with the external world. As if it were a revelation to him, he made much of the novelty. He could not entirely free himself from the power of conventionalism, but it is beyond doubt that he endeavoured to represent real scenes, although, owing to the erroneous principles then accepted, he modified his

realities in order that they might not depart too widely from precedent. Allowance should be made for painters who acted like him, for as pictures in those days were generally intended or executed for churches, landscapes backgrounds were of inferior value if compared with figures. GOZZOLI lived until 1498, and it is therefore clear that attention to landscape art was not given until a comparatively late period. Earlier in the century brothers VAN EYCK were attracted by natural scenes independently of Italian influence, and set an example which was afterwards followed by Flemish artists.

It is impossible to explain the neglect of scenery. materials lent themselves to composition as easily then as now. There were not only beautiful forms, but great masses in which to exhibit light and shade, and, moreover, the earth was allied to that sky which the painters regarded as contiguous to heaven. It may have been a fear that if justice were done to the earth the figures of men would lose their importance; or, it may be, earth was considered as no more than a place of exile which ought not to be much admired by the Christian. The painters were also rarely possessors of land, and perhaps undervalued what they could not attain. Whatever the reason, it is remarkable that in a period when figure-painting flourished and there were great masters, the scenes in which incidents were supposed to occur were rendered in a childish manner. We ought besides to remember that several of the painters began as metal-workers or as sculptors, and in both classes of work landscape is without much use.

It is noteworthy how many of the Italian backgrounds represent rocky and hilly country, although the majority of the painters were lowlanders. When conventional forms were employed, it did not matter much where the artist was born, for he was indifferent to nature. A dweller in a plain is always sure to be struck by elevation. Mr. RUSKIN might not have become so eloquent about mountain scenery if he were a native of the Scottish Highlands. GOREAU, with his customary honesty, acknowledges how he was impressed by Switzerland, where his stoic placidity was overcome, and even after many visits, when in his old age he was engrossed by the study of mineralogy. The rocks which we see in DA VINCI'S picture in the National Gallery are suggestive of a man who is endeavouring to reconcile conventionalism with realism; and we often perhaps to look upon them simply as efforts to suggest the impression which some disturbed region made upon him. In the observations on landscape, which form part of the treatise ascribed to him, it is evident that he had studied from nature. If he seems to devote more attention to the buildings which were visible than to the trees, that was a prejudice of the time. Thus, when he says that a high tree seen from a distance looks broader at the top than at the base, and that the spaces between battlements appear wider than they are, we have records of phenomena which could only come from an observer. Contrive, he says, that the trees in your landscape be half in shadow and half in the light; they are best represented when the sun is veiled with thin clouds, for then they are darkest in those parts nearest the earth. There are also suggestions about the green colour seen in the country, the difference of the appearance of the sea when looked at from the shore or from a ship; about smoke, rain, seasons, climates, winds, &c., which indicate a knowledge of the theory of landscape. It is not improbable that DA VINCI was acquainted with PIERO DELLA FRANCESCA, who was one of the pioneers of realism in landscape.

Both GENTILE and GIOVANNI BELLINI were excellent in landscape, and indicated a time when it was to be predominant in a picture. They were not alone of their contemporary, ANTONELLO DA MESSINA, showing an adaptation of landscape in which nature was not altogether neglected. But of all the Venetian painters TITIAN was unsurpassed as a landscapist. Indeed he was always far more at home in the country than in the city. He does not appear to have cared much about showing buildings, but the native of Cadore was always delicate in putting trees on canvas. If we may judge from copies like that which appeared in the Royal Academy last year, the trees in the *St. Peter Martyr* were almost as attractive as the figures. REYNOLDS says they "are plainly distinguished from each other by the different manner with which

branches shoot from their trunks; as well as by their different foliage." It might almost be said to have originated the "landscapes with figures" of later years. If VASARI is to be believed, TITIAN kept some German landscapists for months in his house in order that he might study with them. Mountains, woods, plains and the sea were alike within the scope of his power. GIORGIONE'S *Concert* in the Louvre rivals TITIAN'S works in the richness of the landscape; that part of the picture at least everyone can understand.

All the painters we have mentioned employed landscape simply as an accessory. It is hazardous to say who was the first landscape-painter, but it is generally believed that ANNIBALE CARRACCI was at least one of the earliest, if not the first, who made the experiment of treating a natural scene instead of an incident. He is known, however, principally by his figure-pieces. SALVATOR ROSA was a more daring artist. He, too, had gained a reputation for historical, or rather classical, paintings. But as he loved tragic incidents he sought out or created views which expressed similar ideas in nature. His bandits are in keeping with his landscapes and his landscapes with his bandits, and his seas are fit to be ruled by pirates. In the eighteenth century we come to CANALETTO, who was the first foreign artist to find pleasure in English scenes. He was a sign of the end of the old conventionalism, for his English pictures could not be so satisfactory if he had not realised the necessity of observing and recording local characteristics. He was, therefore, a counterpart of CLAUDE, who came from the Vosges, and was glad to find employment as cook and colour-grinder for AGOSTINO TESSI in Rome. Then he began to paint. He returned to France in the expectation of remaining there, but Italy had made too strong an impression on him, and he went back to Rome. He was not without an effect on his contemporaries in Italy, and indeed to many amateurs he is the representative landscapist of Italy.

In Italian figure-pieces progress is less marked than in landscape. The examples of the earlier artists are imaginative. It might be said of CLAUDE'S works that they possess the same quality but in another form. For attaining so much it was necessary for the art to be subjected to many changes. Whether CLAUDE or any native artist represented Italy with the same power as TURNER may be doubted. From the latter's success it is evident that the landscape-painter should have much of the cosmopolite in him, and endeavour to be faithful to nature in all places instead of transferring the characteristics of one country to another.

CO-OPERATION IN TESTING MATERIALS.

IN any country where old churches or castles have survived there is likely to be confidence in the strength and endurance of modern building materials. Great Britain is in that way fortunate. It can be said there still remains belonging to nearly the entire Christian era. When the Commissioners who were appointed to discover one for the Houses of Parliament conducted their inquiries, they took care to refer to ancient structures which exemplified the endurance of each variety of stone, and more attention was given to that class of evidence than to the experiments which were specially carried out or the chemical tests employed. Everyone knows how the stone recommended for use did not uphold its reputation, though there were geologists on the commission, they failed to realise that the strata in quarries might not be of uniform strength, nor was sufficient allowance made for the evil effects of a London atmosphere. In spite, however, of this failure, people still believe that any variety of stone which has been used in an old building continues to be adapted for modern purposes. That assumption has had much to do with the recent opposition to restoration, for it was supposed that an English stone which has resisted the atmosphere for a few centuries must be able to defy all the vicissitudes of time during a still longer period. A more scientific study of lithology would suggest that stone is subjected to the universal law of decay, and care should be taken to provide against danger whenever any symptom of weakness is seen.

In past times builders relied almost entirely on the materials supplied by nature. The Romans no doubt

baked thin but lasting bricks, and employed concrete that was often excellent, especially when in large masses. In those cases clay and gravel were adapted for utilisation in new forms. But in our time there is a manufacture of artificial materials on an unprecedented scale. The employment of artificial stone, for instance, is extending every year, and there are occasions when it is considered preferable to the created material. Steel is analogous to artificial stone, for although the component substances are derived from nature, like every other production of man they are subjected to a treatment by which their character is altered. "Stone and wood," says VIOLLET-LE-DUC, "are always stone and wood, and whether we use these materials in a structure in greater or less quantity, their function is the same among all peoples and in all times." Since his time stone is being superseded, and chemists are now endeavouring to impart qualities to wood which will change its nature. Creosoting and other preservative processes by which timber ceases to be attractive to fungi, white ants, sea-worms, &c., have already accomplished a great deal, but much more is required and will no doubt be attained. One remarkable fact is that it is no longer necessary to make any attempt at deception by presenting an artificial production as if it were a natural substance. Portland cement obtained its name from Portland stone, and ignorant people supposed there was some close connection between the two. In America, France and Germany the name is still preserved. If a stronger and better cement could be invented in our day it would probably be called after the patentee. Roman cement also cannot be said to be identical with the material employed by ancient or modern builders in Rome.

Artificial materials, unlike those of nature, can be improved. There is no doubt, for example, that Portland cement as now manufactured is more efficient than that produced before GRANT undertook the vast series of experiments for the Metropolitan Board of Works. From so constant and minute an investigation it was demonstrated how far improvements were desirable, and manufacturers were only too willing to produce slow-setting or quick-setting, fine or coarse varieties. Unfortunately there is a drawback. If we are not able to add strength to stone we cannot make it weaker, unless by using insufficient quantities or by placing it in such a way as to render it more liable to deterioration by the atmosphere. But inferior artificial stone, inferior steel, inferior bricks, inferior cement can be manufactured, and outwardly at least they will appear to possess the qualities that are desirable. ROBERT STEPHENSON, who was the first to employ wrought-iron on a large scale in railway bridges, once told a Parliamentary committee that he was unable to distinguish the difference between a strong plate and a weak one. Since his time the art of deception has advanced, and examples of its power are to be seen in many structures.

The difficulty which in STEPHENSON'S day was experienced in obtaining satisfactory iron is recorded in the history of the Britannia Bridge. In order to insure the employment of only the strongest quality, it was arranged that the directors of the Chester and Holyhead Railway Company should purchase all the iron required and sell it at a fixed price to the contractors for the construction of the tubes. By the arrangement it was believed that only the finest possible quality of iron would be supplied, as was essential for the success of so daring an experiment. "The best plates" were specified. Very inferior plates were, however, sent in by some ironmasters. An investigation followed, and then it was discovered that the word "best" signified the commonest and cheapest plates, higher-priced plates being "best best," the class of plates STEPHENSON intended to use being known as "best-best-best." It was therefore necessary to pay a far higher price than was mentioned in the tenders. The difference in tensile strength between the "best" and the "best-best-best" in 1846 is not now to be ascertained. In the experiments it was found that 20 tons per square inch was the utmost that could be taken as an average. But so conscientious a man as ROBERT STEPHENSON must have felt that from his ignorance of the phraseology of the market he was running the risk of erecting a structure that would be too weak for its purpose and would jeopardise many lives. To refer to such a case may seem to be going

back to ancient history. In modern specifications there are numerous examples of a similar weakness. "Best" is one of the vaguest of adjectives that can be employed in treating of materials. Where it is possible there should be a standard. As regards strength it is possible to apply a test by having pieces broken in a testing machine. But there are other qualities where the trial is less summary.

As we have said, an excess of confidence about building materials prevails in old countries. In America, where a building a century old is accepted as antique, there are no prepossessions, and all materials, whether natural or artificial, are subjected alike to severe tests. In the United States a society for testing materials has been formed. It does not supersede any efforts which were made by many engineering societies, and, indeed, it is willing to co-operate with them. But the range of engineering is so vast there may not be a single paper on the strength of materials read in the course of a session. It is a subject which concerns individuals as well as communities, and consequently municipalities, railway companies, users of materials on a large scale, and manufacturers, willingly render any services which further the researches needed for the extension of knowledge. Unfortunately no institution of the kind exists in England, and when attempts are made to establish general rules relating to any kind of materials there is widespread indifference, and the results, however carefully ascertained, are not received as authoritative. The Americans, moreover, regard their labours as only part of those of an international society, and consequently a comparison of results is made with those obtained by French and German experimenters. In that way it can be determined how far effects are uniform, and an approach is made to the realisation of general laws.

We have just referred to the difficulty of a standard in iron or steel. If we examine the statements of ironmasters there would seem to be little uniformity in the degree of strength, and it varies according to districts and works. In America there are apparently several general standards for tensile strength. One is from 52,000 lbs. to 62,000 lbs. per inch; another is from 60,000 lbs. to 70,000 lbs.; a third is from 55,000 lbs. to 65,000 lbs. As yet there has been no adoption of any single limit. So long as it is believed that steel is equal to 70,000 lbs., or 31 tons, per inch, it is concluded that manufacturers who would be willing to accept a lower degree of strength would be driven out of the market. The competition in the production of steel is extreme, and the splitting of the difference between 60,000 lbs. and 70,000 lbs., or the adoption of 65,000 lbs. as an official standard, is supposed to be one of those compromises which would be worthy of a class of producers among whom there is continual progress. Whatever may be the result eventually, it is quite evident that a 60,000 lbs. test can be specified without misgiving. It is not enough to have quality specified. Respectable manufacturers employ staffs of experts who feel a pride in their materials, and it is admitted that costly tests will be undertaken in order to satisfy an architect or engineer that the material prepared answers its description.

Another material which excites almost as much interest in America as steel is cement. Concrete and artificial stone are in demand, and their value depends in great measure on the quality of the cement employed in the manufacture. A large amount of preliminary work has been done by the committee of the Testing Society on the subject. But, in order to obtain as wide a scope as possible for the inquiry, samples of five Portland and four natural cements with sand have been sent to no less than thirty laboratories in different parts of the United States. Copies of the rules adopted by the society were enclosed with them to insure that uniformity of tests should be secured. Some of the results have been received, and when all arrive they will be co-ordinated to enable conclusions to be drawn by users of cement. A third subject is the coating of steel and iron by paint or other material. The experiments relate to structures above ground in tunnels, in sea-water, or in places like the roofs of engine sheds which are subjected to steam. This is an inquiry which has great interest for railway companies, for unless bridges and roofs can be protected rust will shorten their duration. In consequence, an immense number of experiments are now in progress on railway works.

Towns spring up so quickly in America a cheap pavement is indispensable. Asphalt has been employed largely, but its use is only temporary. It has been found that gas is a greater enemy than water to asphalt, but worse than all are gas and water. If the lower face of the asphalt remained permanently damp the material was sure to deteriorate, and for that reason the concrete base was recommended to be as impervious as possible. Some surprise was caused by the conclusion that asphalt, however excellent in paving, was not adapted as a waterproofing material. The subject of road construction in general is not considered by the Americans as exhaustive. A road-material laboratory has been set up by the Government in Washington, and the information derived from experiments will be disseminated throughout the State. An establishment of the kind is much needed in this country, for the operations on country roads are mostly dictated by empiricism.

The interest which the American Society for Testing Materials has excited is shown by the increase of membership which takes place every year. In 1902 the number was 175; this year it is 349. In some societies manufacturers are excluded, but in this new society they are allowed to stand on an equal footing with other classes of members. In that way the suspicion about the good faith of produce is removed, and we feel no doubt that all manufacturers will realise that they have a duty to fulfil which is not selfish. On the other hand, the investigations will possess a practical aim, and will not resemble some in which the main object was the enlightenment of novices. Five or six years' experience has shown that only good results can follow from the investigations, and if a similar society were founded in England the results would probably be no less advantageous.

THE MANCHESTER INFIRMARY.

THE building committee of the Manchester Royal Infirmary received applications from fifty-six architects who were desirous to take part in the competition for the new building in Stanley Grove. On the recommendation of the assessors Mr. J. J. Burnet, twelve were selected as follows:—

Mr. H. Percy Adams, London; Messrs. Campbell, Douglas & Paterson, Glasgow; Messrs. Edwin T. Hall & John Brook, London; Mr. W. Cecil Hardisty, Manchester; Messrs. Heathcote & Sons, Manchester; Messrs. Henman & Cooper, Birmingham; Mr. John W. Simpson, London; Messrs. Thomson & Sandilands, Glasgow; Mr. A. Hessel Tiltman, London; Messrs. Waddington, Son & Dunkerley, Manchester; Messrs. Thomas Worthington & Son, Manchester; and Messrs. Young & Hall, London.

The board of management have approved of the arrangement.

THE ROYAL VICTORIA HOSPITAL, BELFAST.

THE erection of the Royal Victoria Hospital, Belfast, which was opened by the King and Queen on Monday last, was rendered possible by means of a Victoria Jubilee Fund inaugurated by Mrs. Pirrie, of Ormiston, during the Lord Mayoralty of her husband, the Right Hon. W. J. Pirrie.

An excellent site of 6 acres at the junction of Grosvenor Street and Falls Road was granted by the City Council; and the committee having inspected several large modern hospitals appointed as architect Mr. William Henman, F.R.I.B.A. (who had then recently completed the General Hospital, Birmingham).

When the arrangement of the building was under discussion reference was made to correspondence in the Press as to the possibility of superseding the pavilion type of plan. The chief objections to pavilion buildings of several storeys are the distances apart of the wards, the necessity for staircases and lifts, the excessive labour to the staff, and the difficulties of supervision and administration. He therefore suggested it might be better to spread out the wards on one storey only, placed side by side, without intervening open spaces, lighted from the ends and by clerestory side windows.

These ideas commended themselves to the majority of the committee, and Mr. Henman was requested to develop the design on the lines he had proposed. Working drawings were prepared in conjunction with his partner, Mr. Thomas Cooper, A.R.I.B.A., and in the autumn of 1900 a contract was entered into with Messrs. McLaughlin & Harvey, builders, Belfast, who have carried out the work in a satisfactory manner. Messrs. Henry Lea & Son were appointed consulting engineers, Mr. G. A. Flower acted as clerk of works, Messrs. W. H. Stephens & Son being the quantity surveyors.

The accommodation provided is for 300 patients, eight

resident medical and surgical officers, a superintendent, a matron, seventy-eight nurses, and thirty-two male and female servants. The novelty in the design is that the whole of the accommodation for patients is on the ground-floor level; the wards (nineteen in number), with their accessory rooms, being placed side by side, lighted by large end windows, having a pleasant outlook to the south over park-like land, and by side clerestory windows. This becomes practicable by the employment of economical means by which the whole atmosphere of the buildings is changed ten times per hour in summer and seven times in winter without the necessity for opening any windows. The air is cleansed and tempered, so that both by night and day the whole hospital is maintained in a fresh and wholesome condition, without draughts or open fireplaces, and the noise, dirt and attention they require.

The administrative buildings of four storeys and basement, in three separate buildings, provide a spacious domed entrance-hall (above the porch to which is a bronze statue of the late Queen Victoria executed by J. Wenlock Rollins, sculptor, of Chelsea, and presented by the Right Hon. W. J. Pirrie); a board-room and general office in the central block, and accommodation for the resident staff; the nurses' home, the attendants' and servants' quarters, the dispensary, kitchen department and store-rooms in the east and west wings. These buildings open on the ground floor into a main corridor, running east and west, 440 feet in length by 9 feet in width, to the south of which open branch corridors leading to seventeen wards and their accessory rooms. The principal wards (each for fourteen beds) are alternately arranged for male and female patients, there being eight wards for medical, eight for surgical and one for gynaecological patients, each honorary physician and each surgeon having control of two wards, one for either sex.

On the north side of the main corridor are two wards for ophthalmic cases, each for six beds.

In connection with each group of four medical wards there are two clinical rooms and a large classroom for students, and to every pair of surgical wards there is an operating-room in addition to special operating-rooms for the gynaecological and for the ophthalmic departments, each completely fitted with sterilising, electrical, lavatory and other necessary appliances, as well as surgical instruments. Near by each of the nineteen large wards is a separation-ward for two beds. A ward-kitchen serves each pair of wards (except for the gynaecological cases, where the department is self-contained). Bath-rooms and conveniences are attached to all the principal wards, as well as linen cupboards, and there are store-rooms for patients' own clothing.

Two detached buildings are provided towards the west end of the site for isolation purposes, one being for six and the other for four beds, with kitchens, conveniences and nurses' bedrooms.

To the west of the administrative buildings is the out-patients' or "extern" department, consisting of a large waiting hall, with medical and surgical consulting-rooms, two operating-rooms, registrar's office, &c., grouped around, all on the ground floor, and connected with the main corridor of the hospital, retiring-rooms for students being provided in the basement.

Further to the west is a detached building containing the pathological department, which comprises a laboratory and microscopic examination-room, a post-mortem-room, mortuary, exhibit and viewing-rooms.

At the east end of the site are two detached buildings—one is the boiler-house, containing two powerful steam boilers, disinfecting apparatus and an incinerator (the chimney from the furnaces holding a prominent position is treated architecturally); the other building is the laundry, fitted with very complete steam appliances. Soiled linen is taken from the wards to the end of the main corridor, sent down a glazed earthenware tube, and conveyed to the receiving-room in the laundry, when, after making the circuit of the washhouse, drying closets and finishing department, it is transferred to the linen store in the basement of the administrative buildings, ready for reuse.

The cost, including engineering requirements, was 300*l.* per bed.

THE STRAND IMPROVEMENT.

THE improvements committee of the London County Council have prepared a report, in which it is stated that they were giving careful consideration to several suggestions which had been made to them for the alteration of the line of the Strand between the church of St. Mary-le-Strand and that of St. Clement Danes. Before deciding upon any definite recommendation to the Council they thought it right to report facts in connection with the several proposals which had been laid before them.

Before the scheme for the Holborn to Strand improvement was approved by the Council they consulted the Royal Institute

of British Architects, with the result that the scheme which was finally adopted by the Council was one which embraced the suggestions made by the Royal Institute after the committee had slightly modified the Institute's plan in order to make the crescent road (Aldwych) connecting the new main street with the Strand more symmetrical. They had recently had before them a letter, dated May 21, from the Royal Institute of British Architects, calling attention to a letter which appeared in the *Times* of May 4, 1903, from Mr. Hamo Thornycroft, suggesting a considerable amendment of the Council's line for the northern frontage of the Strand between the two churches with a view (a) to bringing the church of St. Mary-le-Strand into alignment with the centre of the thoroughfare, (b) to making the direction of the thoroughfare aim at the front of the church of St. Clement Danes, and not at one corner of it, and (c) to securing for the future a good view of the Courts of Justice to all approaching that building from the Strand on the west. The Royal Institute had stated that, although in entire artistic sympathy with Mr. Thornycroft's scheme, it was fully alive to the difficulties, financial and other, in the way of its execution, and the Royal Institute had therefore suggested a modification which it thought could be carried out with a comparatively small sacrifice of pecuniary interest, and would practically secure the advantages of Mr. Thornycroft's scheme. By Mr. Thornycroft's proposal the portion of the Strand between the eastern end of St. Mary-le-Strand Church and Aldwych would be widened to an average width of 150 feet; by the Royal Institute's plan the average width would be about 120 feet. The Royal Institute had contended that by carrying out its plan a better view would be afforded of both churches from either end, and also of the Law Courts, and the apparent narrowing of the Strand at the point in question would be obviated, and that although the eastern end of the crescent site would not be entirely symmetrical with the western end, this would be observable only on paper, and would not be seen when the actual work was carried out. They were impressed with the importance of the suggestions made by the Royal Institute, and they accordingly invited certain of its representatives and also Mr. Thornycroft to meet them on the site, and they had since had before them a plan submitted by the Royal Institute, showing definitely the scheme which it now proposed.

The superintending architect to the Council had also laid before them a plan by which the average width of the Strand would be 115 feet. It was only right to state that Mr. Thornycroft at his interview with the committee had expressed himself as being in general accord with the proposal made by the Royal Institute. If the modification originally suggested by Mr. Thornycroft was carried out, it would necessitate the addition to the public way of the Strand and Aldwych of land which would otherwise be let for building purposes and was valued by the Council's valuer at 350,000*l.*; the loss of recompense if the Council were to adopt the amendment suggested by the Royal Institute of British Architects, now accepted by Mr. Thornycroft, was estimated at 70,000*l.*; while the loss to the Council if the suggestion made by the Council's superintending architect was adopted was estimated at 59,000*l.* In order that members of the Council might have an opportunity of studying the question on the site, they had arranged for the erection of poles and boards upon the vacant land on the northern side of the Strand between the two churches, the boards being painted in different colours to show the several modifications suggested. They proposed to give further consideration to the subject, and to bring up a definite recommendation to the Council after the summer recess.

EMBROIDERIES AT THE VICTORIA AND ALBERT MUSEUM.

SOME fine examples recently added to the collection of ecclesiastical embroidery at South Kensington are now exhibited there in the Tapestry Court. They were obtained from the Hochon collection, which was sold in Paris last month. The museum owes one of the best among them to the generosity of Mr. J. H. Fitzhenry, who placed at the disposal of the authorities a sum sufficient to purchase the beautiful Italian orphrey, dating from the second half of the fourteenth century. (No. 831—1903.) It is remarkable both for beauty and fineness of workmanship, and for the simple and expressive manner in which the artist has told the story of the Virgin Mary. The subject is represented in nine scenes, beginning with the rejection of Joachim's offering in the Temple, and ending with the Assumption of the Virgin. The orphrey probably belonged to a cope, and may be compared with that on the cope No. 580—1884 exhibited in a wall-case in the Italian Court. An English orphrey (No. 827—1903) comes in no degree behind this Italian example in technical qualities, and forms another illustration of the remarkable pre-eminence of English embroideries in the earlier

Gothic period. *Opus Anglicanum* had acquired a celebrity on the Continent of Europe before the middle of the thirteenth century, and beautiful examples dating from that and the following century, and showing unmistakable signs of English origin, are still to be found in Italy, Spain, France and elsewhere. The orphrey in question belongs to the close of the thirteenth century, and may be compared with the famous Syon cope and other less known Early English embroideries, exhibited among the vestments adjoining the Italian Court. Part of another English orphrey in two pieces (Nos. 828 and 829—1903) belongs to a slightly later period. Two complete chasubles were also acquired, one of green brocade (No. 830—1903) with French orphreys of the fifteenth century embroidered with female saints, and the other of green velvet (No. 825—1903), with a fine Flemish orphrey of the early years of the sixteenth century, representing a Tree of Jesse. Two bands of Cologne work (Nos. 823 and 824—1903) illustrating the possibilities of combining the weaver's and embroiderer's art, date from the latter part of the fifteenth century. One other piece may be mentioned—an orphrey from a chasuble (No. 826—1903), bearing the date 1526 on a cartouche beneath the central figure of David, and most probably of French workmanship. It forms a simple and useful example of continental work at a period when the art of the embroiderer in this country, after a decline during the Wars of the Roses, shone again for a brief period before its practical extinction, so far as ecclesiastical work is concerned, at the dissolution of the monasteries.

PUBLIC BATHS.*

THE cost of an unremunerative undertaking is practically to be reckoned by the annual income it absorbs, and in the case of a building, this may be made up as follows:—(a) Interest on first cost of building and sinking fund; (b) maintenance and repairs of building; (c) working expenses.

How, and in what direction, is it possible to economise wisely in respect of the first cost of a building?

The maintenance and repairs will depend upon soundness of construction and permanence of the surfaces.

The working expenses are dependent generally upon good arrangement, but also largely upon the planning of the building.

The first consideration is the kind of site for the building, and although I know I am at variance with some authorities upon bath planning, I venture to say that the idea that any sort of site is good enough for baths is radically wrong, although on superficial grounds it is hard to controvert. It appeals to that instinct for short-sighted economy which does so much to hamper real progress and thwart the best efforts. It has, I am sure, been responsible in London especially for the selection of some of the most extraordinary sites which have taxed the ingenuity of architects to use to advantage. Such sites almost invariably entail straggling, and therefore uneconomical plans. The various sections are necessarily so placed that many of them cannot be reached from the entrance except by means of long corridors which are wasteful, and quite useless for any other purpose.

To illustrate this point, I show below in a tabulated form the proportion of area of means of communication, including halls, staircases and corridors, to the accommodation of a number of public baths. It would be invidious to give the names of these buildings for obvious reasons, but I may say that all of them are well-known and modern establishments, some in London, and the remainder in certain provincial towns and cities.

Each establishment comprises two or more of the following separate sections, viz.:—Swimming baths (one or more), warm baths (two or more sets), Turkish baths (one or more sets), public wash-house, boiler-house and towel laundry, administrative offices and superintendent's quarters.

In nearly every case the nature of the site has been mainly responsible for the excess of waste room.

Ex-ample.	Warm Swims.	Turkish Baths (Sets).	Ad- ministrative Offices.	Boiler-house, &c.	Wash-house.	Total Number of Sections.	Area of Corridors.	Area per Section.
1	3	4	—	1	1	10	6,600	660
2	4	4	—	1	1	11	6,280	571
3	2	4	—	1	1	9	5,130	570
4	4	4	—	1	1	11	6,000	555
5	3	4	—	1	1	10	5,000	500
6	3	4	1	1	—	10	4,230	423
7	3	4	—	1	1	10	3,050	305
8	4	4	—	1	1	11	3,000	272
9	3	4	—	1	—	9	2,350	260
10	2	4	—	1	—	8	1,145	143
11	2	4	1	1	—	9	1,013	112

I commend these figures to your careful consideration, and

further, to such of you as are interested in the planning of these institutions, I suggest that you make a similar comparison of any establishments which you may know, and I feel sure you will agree that much more room is devoted to corridors than is either necessary or to be desired.

Every square foot of corridor, &c., may be fairly reckoned as representing 20 cubic feet of building, which at 1s. per foot = 20s. When superfluous space at this price per foot is reckoned by hundreds and thousands of feet, the total is considerable, and I think worth serious attention as a factor in the cost of such buildings. But that is not the whole cost, for must be borne in mind that every unnecessary square foot of space involves so much extra expense for maintenance and supervision—items which can be capitalised into a serious sum of money.

To make my argument convincing it is necessary that should show that inconvenient sites are responsible for the waste. I illustrate this by an example, and for obvious reason I have chosen one of my own buildings. The St. Marylebone Baths, of which I show the basement, ground and first floor plans, stand on a deep, narrow and ill-shaped site. Adjoining is a plan showing how the building could have been designed upon the wider and shallower site which might have been secured by the acquisition of the adjoining front land. The area of corridor in one plan is 3,000, and in the other 2,020 square feet. The revised plan occupies 630 feet less land. I show also the plan of Plaistow Baths, the site of which was admirably adapted for economy in means of communication, and I may add that in this building the area of corridor per section is 143 feet only, and that the whole is under easy supervision from the offices. Another plan is that of Stratford Baths, in which the area of corridor is 423 feet per section. This is due not so much to the site as to the position of the entrances at one end. The area could have been greatly reduced if the entrances could have been placed in the side street.

By the courtesy of Mr. F. E. P. Edwards, the city architect I am able to show also plans of the Bradford new baths. As they are even now only in course of construction, they should be designed upon the best and most modern lines.

The Corporation are adopting a general scheme for the whole city, comprising a large central bath and several smaller branch or local establishments. These latter are being designed and carried out by Mr. Edwards; and by no means the least excellence of these plans is the very small area devoted to corridors. The proportion per section is 70 to 80 feet only.

Not infrequently "service corridors" are provided, but they are a useless expense. It is always preferable to make impossible for the superintendent to go about the building without passing through one or other of the departments. The attendants are more likely to keep their sections in order if they are liable to be overlooked at any time of the day.

In the older baths (and indeed it is the case with some modern baths), it was no uncommon thing to find four separate entrances for bathers, one for each class of each sex. Now days more frequently two entrances only are provided, one for each sex. In these democratic days, when class distinction are wearing down, there is less disinclination on the part of the gentler classes to rub shoulders with their rougher neighbours. One pay office therefore suffices, whereas under the former system two at least were necessary. The services of a money-taker, or rather two, are thus saved, representing at least 150l. per annum in wages alone. Personally I have always advocated a common entrance for both sexes as obtainable at any railway station or other public building. I should add that where a bath is used for public entertainments separate entrances should of course be provided.

Waiting-rooms to swimming baths are so little used that they would seem to be scarcely necessary. They are seldom if ever, really comfortable, and the bath hall always the superior attractions. In spite of rules and regulations to the contrary, bathers generally crowd round the bath itself and stand about the footways. This is of course exceeding inconvenient and subversive of order. Is it not preferable to let bathers in waiting sit or stand in the gallery?

In some places there is a small charge made for admission to the gallery, which, of course, does not carry the right bath. From the point of view of economy, a gallery would probably cost less than a waiting-room of adequate area.

Another move in the direction of economy is the abolition of the slipper bath in favour of the spray bath. It is scarcely necessary in these days to compare the merits of the two systems, although it is surprising to find how slowly the latter is replacing the former in view of its undoubted superiority. I will only here remind you of the features which recommend it on the grounds of economy, viz. it occupies just about the space of the slipper bath, and uses half, or less than half the water necessary for the former. In an establishment of, say, 50 baths, the saving in the structure and fittings alone would probably exceed 40l. per bath, or, say, 2,000l., and su-

* A paper on "Public Baths, the Influence of Planning and Construction upon the Cost of Maintenance and Administration," read by Mr. A. Saxon Snell, F.R.I.B.A., at the Sanitary Institute Congress.

posing that each bath was used on an average during the year three times daily, water would be saved to the extent of over 1,000,000 gallons, which at 6d per 1,000 = 25%, or the interest on over 800%. To this must be added the saving in fuel, &c., in heating the water and less cost of attendance. I believe that a well-appointed and arranged set of spray baths, each with its separate dressing-room, and with common warm and plunge baths, would attract better-class bathers in paying numbers. Well-equipped Turkish and Russian baths at a moderate price should also prove paying departments. Special or medical baths are probably more suitably attached to hospitals or hydropathic hotels.

A great deal might be done also to make baths more attractive and inviting and therefore more paying by the study and application of the many little details which seem to appeal to human nature with so much greater effect than is the case with far more important matters. I may instance the circumstance of one particular bath in London which, as far as I know, is certainly not better planned nor decorated, nor better, nor indeed so well fitted as many others, and yet it is, or used to be, the most favoured bath in the Metropolis. The only reason for its popularity appears to be that the whole establishment is tastefully decorated with growing ferns, which flourish exceedingly well in the warm moist atmosphere of a bath. The effect is certainly most attractive, and robs the whole building of the stiffness and cold formality of a public building.

It would appear that the great importance of inculcating the habit of frequent bathing is sufficient to justify managers descending, if you so please, to the small art of making the habit pleasant and attractive at any cost.

I have been given to understand that the Corporation of this city (Bradford) have resolved upon allowing the use of their bath free on certain days to poor children. This is a movement which, I am sure, will be watched with a great deal of interest, and it seems more than likely that, besides the immediate benefit to the children, the habit and love of bathing will be inculcated in a great many of them, and they may, later on, go to increase the number of regular bathers who pay for admittance and thus help to make baths self-supporting.

It seems a great pity that swimming baths in this country can only be kept open during six months of the year. In some establishments at least one bath is kept open all the year round. This is only possible by keeping both bath and hall well heated, though this may be and frequently is overdone. Even so, they are poorly patronised, and it would appear that something is still wanted to attract bathers during the cold months.

It is desirable that all the warm baths should be as close together as possible. I remember some time since reading the description of a design in which the author in effect drew attention to the fact that every section of his scheme was carefully separated from every other, so that there could be no communication between them. I refer to this description merely because it represents the very antithesis of what should be the architect's aim in the arrangement of baths. I should add that his plans showed the warm baths arranged at three different floor levels.

The only divisions required are, in the first place, for the separation of the sexes (and this should commence from the general entrance hall), and secondly, separation of the classes, which need only commence at the waiting-rooms immediately adjoining the baths.

Referring to the plan of the St. Marylebone Baths, I will draw your attention to the arrangement of the warm baths, which most nearly approaches the ideal I have in my mind. You will see that the first and second-class bath sections in the case of both men and women are divided by doors only, so that each set is in a way interchangeable, and by this arrangement a minimum number of attendants is required, and in the slack hours one only would be sufficient for both classes of each sex.

The work of a bath attendant is peculiar in many ways. His energies are used in a very unsatisfactory manner. As a bath attendant he may be very busy for two or three hours in the day, and for the remainder he has little or nothing to do. He fills in his slack time by cleaning and polishing the baths and fittings under his charge, and if he is in charge of a sufficient number he will be well employed most of his time. But his general employment varies according to the season of the year, and if the number of attendants on duty is calculated for the busy season of the year it follows that at other seasons they cannot have sufficient to do to keep them fully employed. As a consequence they are likely to get into that worst of all habits, lounging.

In human labour as in machinery, the best results are obtained by steady and continuous work, though comparison fails when we reckon the length of time each can work on end. It is customary to employ these men for a number of other duties, especially that of repainting and general cleaning work which is required so continuously at public baths. This employment, however, is a good deal resented by thorough-

going trade unionists, and nowadays on public boards we have to reckon with trades unionist feeling.

I fear that I cannot suggest any other remedy than that of endeavouring to convince those who hold as a fetish the ideal of "one man one job," that there are employments in which it is folly and sheer waste to apply this rule, and that a bath attendant's is one of them.

One of the most important parts of a bath scheme, especially from the point of view of economy, is the engineering scheme. The boilers and engineering works generally should be of the best description and designed on the most economical lines for the highest efficiency, and by this is meant commercial efficiency, and it is better to reorganise, if necessary, the whole of the engineering plant of an establishment, even at considerable cost, than to waste power and fuel year after year with inferior plant. Americans regard the high efficiency of machines as a matter of first importance, and I have been told that it is no uncommon occurrence for an American manufacturer to throw out of use a costly machine, which has been erected a few months only, on finding that some machine in the market will do a small percentage more work. But then, Americans above all people understand the enormous value of small margins of profit.

Engineers tell us that every ton of coal of standard quality is capable of producing a certain number of units of heat, which again can be converted into a definite number of units of force, and the aim of every good engineer is to obtain the maximum in both cases. In the case of heat it is to this end that boilers are carefully designed, and should be improved or kept in the best order from year to year. Records should be kept from day to day of the amount of steam produced and coal used, and when the proportion between the two begins to fluctuate it may be taken that either the coal is bad or that the boiler or some part of the apparatus is at fault.

This also applies to the engineering system generally, by which I mean that it is quite possible to reckon what power is required to do certain work and to judge from time to time whether the work is taking more power than it properly should. It is certain that wherever this system is adopted a considerable saving must be made in coal consumption and renewals of machinery, and also that the efficiency of the buildings is greatly increased. The work can scarcely be done scientifically by the working engineer, although I believe that many, if not most of them, do use their judgment in this way in a rough or rule-of-thumb manner.

I venture to think that it would pay most municipalities to employ a special statistical officer to organise a system of engineering accounts for each establishment, and to check from time to time the results obtained from the fuel consumed.

There is not room within the limits of this paper to deal in detail with other matters of construction, but I have no hesitation in asserting that there is much room for economy in this direction.

Owing to the excessive wear and tear upon all fittings it is a matter of great importance that everything should be of the most substantial construction. The unavoidable moisture in the atmosphere in baths necessitates glazed or other impervious surfaces for the walls and floors. The importance of absolute cleanliness in every part of the establishment calls also for the avoidance of all angles, mouldings and other repositories for dirt, as much as it the buildings were for hospital purposes. These contingencies have generally involved the use of costly materials and construction, but there is a tendency to run in grooves in the use of well-known materials and forms of construction. I am confident, however, that a good knowledge of the qualities of materials, combined with judgment and the courage to be original, will enable a bath designer to effect large economies in these matters. It is essential that he should, in the first place, make himself acquainted with the habits of bathers, the peculiar conditions of these buildings and the general working arrangements, all of which can be learned in consultation with any willing and intelligent superintendent. Solidity and simplicity in construction materially affect the question of first cost and to an even greater degree maintenance charges.

In conclusion, it is necessary to add that it is not claimed that the economies to which I have drawn attention will alone render these undertakings remunerative, but they will go a long way towards that desirable goal, and tend to encourage municipalities to still further extend the area of their usefulness.

The Fifty-fifth Annual Meeting of the Somersetshire Archaeological and Natural History Society was held at Chard on Tuesday last and two following days, under the presidency of Mr Francis J. Fry, of Cricket St. Thomas, Whitestaunton Church, manor house and the site of the Roman villa was inspected, and a visit was made to Castle Neroche and its ancient British camp.

NOTES AND COMMENTS.

THE syllabus of the lectures which will be delivered during the forthcoming winter term of the Berlin University is remarkable for the variety of important subjects which are to be treated. Among those relating to art are the following:—"Greek States renowned for Art," by Professor VON WITAMOWITZ-MÖLLENDORFF; "The Pergamon Museum," by Herr WINNEFELD; "Art and Culture in Venice," by Herr ZIMMERMANN; "LEONARDO DA VINCI as Artist and Theorist," by Herr WULFF; "The Art of Europe in the Nineteenth Century," by Professor FREY; "The History of Music from SCHUBERT to BRAHMS" and "MOZART'S Life and Works," by Herr FRIEDLÄNDER; "History of Musical Notation," by Professor FLEISCHER. There will be, as usual, several lectures on English subjects, such as CARLYLE, DICKENS, THACKERAY, GEORGE ELIOT, the England of to-day, the development of England since the seventeenth century, &c. The lectures are independent of the University courses, and are intended to suggest what are the latest conclusions in several branches of knowledge. When we find such subjects as "The Organisation of Modern Wholesale Trade" and "An Explanation of King HAMURABI'S Babylonian Code of Laws" in the course, it is evident that past and present alike come within the range of Berlin curiosity.

THE Santis chain of mountains runs partly through the Swiss canton of Appenzell, and in a geological sense is of great importance. Dr. HEIM, the professor of geology in the University of Zürich, has completed a relief of the mountain range, which has occupied him for no less than five years. From the manner of colouring it becomes artistic as well as scientific. The scale adopted is 1:5,000, and all that can be discovered by geological surveys is exemplified. The model was first made in fine plaster and then transferred to gypsum, and in the carving it was altered and realtered until the utmost exactness was attained. As many details are given as the scale would permit. Among geological and topographical representations Professor HEIM'S relief holds the first place.

ILLUSTRATIONS.

THE REPAIRING OF ST. CRANTOCK CHURCH, CORNWALL:
THE SCREEN.

THE repairing of this interesting collegiate church is not yet completed, although the work has been in progress for three years. The Norman building consisted of a small nave with transepts, and a chancel which was as large as the nave, to accommodate the members of the college. There was the usual central tower, which fell into a ruinous state, so that Bishop BRANTYNHAM, in 1377, ordered its repair. This, however, was not done, for in his mandate, dated December 1399, he left 20*l.* for its restoration, a sum equal to about 400*l.* of our money.

The fabric was in a more or less ruinous condition when it was taken in hand four years ago, and some 4,000*l.* has been expended on the work. The greatest care has been taken by Mr. SEDDING to preserve everything old and not rebuild the walls. The internal fittings are of the best oak, and no time has been spared to endeavour to bring this charming sanctuary back again to its former beauty.

HOUSE TO BE BUILT AT OXSHOTT, SURREY.

THE site of this house is on a hill ridge, from which several pleasant views are obtained, particularly in the direction of the Crown forests, which are not likely to be destroyed by buildings. Thus in placing the house on the site due respect has had to be paid to the prospect as well as the aspect. The carriage entrance is on the north-east side, and the terraced garden front which we illustrate is the south-west side. It is possible that a conservatory will be built against the drawing-room at the south-east side. A fine clump of trees will tend to shelter the kitchen wing from the north.

The facings are to be of hand-made sand-faced bricks of a deep red colour; the gables coped with red Staffordshire bricks and tile-creasing set in cement. Only a few moulded bricks will be used at the extreme top of the

gables, and stonework, except in cills, &c., has been avoided. The wooden frames are shown, and they are to be painted white to contrast with the deep red of the brickwork. The roofs are of Broseley tiles.

The style is suitable to the material used and to modern requirements, and yet pleasantly reminds us of many houses built in the eastern counties under Dutch influence. The architect is Mr. ARNOLD S. TAYLER, A.R.I.B.A., 27 Old Queen Street, Westminster.

CATHEDRAL SERIES: EXETER.—THE NAVE, LOOKING WEST.

THE western view of an English cathedral or church is rarely satisfactory, for it is terminated by a dead wall and a small door. In Mediæval times there may have been altars, statues, or paintings, which produced a more satisfactory effect. Exeter is no exception, unless we consider the window with its elaborate tracery, now filled with PECKETT'S glass. BRITTON dwells on the variety of the design, saying:—"Eight mullions are disposed in a manner to form five different species of the Pointed arch, viz. the acute and the broad lancet, the equilateral triangle filled with tracery, the Tudor or flattened, and the ogee. These mitre into and combine with one large circular compartment and two smaller ones in the angles. Within the large circle are twelve smaller circles enclosing lights of quatrefoil and cinquefoil patterns, and embracing circular compartments of seven other lights bounded by interlacing tracery of triplicated design." There is some difference in detail between the window and those in the transepts, the lines of the former being more flowing.

PREMISES AT READING.

THIS building, fronting on Oxford Street and Chesham side, is an addition to the premises now occupied by Messrs. WILLIAM MCILROY, LTD., which covers between two and three acres. This new addition has a frontage of 464 feet. It is divided into two immense shops on ground floor, with offices for a large staff of clerks. The boiler room is on the first floor; it is panelled with oak, and approached by a rouge and Sicilian marble staircase supplied by ARTHUR LEE & SONS. The marble has been relieved by a band of POWELL'S opus-sectile tiles from Whitefriars Glass Works.

A part of the basement is used as an unpacking warehouse, and is approached by a vanway from Chesham side; the other part has approaches both from the street and the shop, and, as well as the first floor, it will be used for the departments for which there will be no room on the ground floor. The building is fireproof throughout, and in the upper part are provided dining-rooms, sitting-rooms, music room and about 150 bedrooms for assistants. These rooms have been handsomely finished off, and the walls of the kitchen, scullery, larders and all other parts for which an exceptional amount of wear is anticipated are lined with the Opalite Company's "Opalite" or white glazed bricks, and the floors laid with RUST'S vitrified mosaic.

There are many fireproof staircases, also an external fireproof gangway running from end to end at the back of the building, connected by staircases to each floor and to the ground.

The building is entirely supported on solid steel columns supplied by S. GRIFFITHS & CO., of the Railway Foundry, Reading; the steel girders by DORMAN, LONG & CO., of London. There are more than a thousand tons of steelwork altogether.

The front of the building is faced with light-red majolica glazed bricks supplied by Mr. J. C. EDWARDS, of Ruabon, and relieved with buff terra cotta from the Meesham Terra Cotta Works, and Guiting stone from the Taynton and Guiting Stone Quarries, Ltd. The chimneys are built with Mr. J. C. EDWARDS'S buff bricks. The steep pitches of roof are laid with local red tiles, the flat pitches being laid with MAJOR'S patent interlocking Bridgwork tiles. The glazing of the roofs is done by W. E. RENDLE & CO., of London, and the fascias by S. JONES & CO., of King's Cross, London. The hot-water heating is done by RENTON, GIBBS & CO., of Liverpool; the lift is supplied by J. LUCAS & SON; the hot-water service by CALLAS, SONS & MAY, LTD., of Reading. Mr. H. W. GODWIN, of Reading, is the contractor, and Messrs. JOSEPH MORRIS & SON, of Reading, are the architects.

ROYAL ARCHÆOLOGICAL INSTITUTE.

THE annual meeting of the Royal Archæological Institute was held this year in York, and began on the 21st inst. The last time the Institute visited the city was in 1846. The members were welcomed by the Lord Mayor. Afterwards Sir George Armytage, the president, gave a forecast of the business which was to be transacted. In the course of his address he referred to the photographic survey taking place under the direction of the National Photographic Record Society, to which all were invited to send photographs of any antiquarian subjects, whether parts or whole of ancient buildings. It is a very easy matter to do so, and a very small expense, but when these photographs are properly arranged and catalogued as they now are by this Society, and then deposited in the print-room of the British Museum, they become most important evidence of the features of the country at the time they were taken. It is obvious what an advantage it would be to secure a faithful picture of an old building before the restoring architect or local builder commenced operations. It frequently occurs that it is absolutely necessary in the construction of public works that old structures must be destroyed, or at any rate altered to meet the new circumstances. In a city like York, which has good reasons to be proud of its ancient buildings and history, there is a desire to preserve every link that is possible with the past, and due regard will always be given to retaining, as far as possible, the ancient work without preventing the proper development of the more modern. When men of common sense come together to discuss these matters there is always a method to be found of carrying them out if there is a will.

York Cathedral.

The first visit was to the Minster. Mr. J. T. Micklethwaite served as guide. Mr. H. J. Westlake described the remarkable first panel in the upper part of the second clerestory window in the nave. He said that that panel of painted glass was probably the most interesting fragment in the county for many reasons. It was a pity that it had been placed in the clerestory, for it was almost out of sight and difficult to examine, and, moreover, it was never in any way related to its present position. About the year 1880 he had a scaffold erected, and a careful tracing of the window was made. He was then struck with the great excellence of the work. Considering its period, and if it is an English production, it is in itself an evidence of the good condition of art in this country. He did not wish to recapitulate what had already been said about that glass, but if possible he would give a few new suggestions. The glass belonged, almost without doubt, to the church built by Thomas of Bayenz, consecrated bishop in 1070. The choir was, however, pulled down and enlarged by Archbishop Roger from 1154-81, and the nave rebuilt between the years 1291 and 1345. It might, therefore, have been removed from the old nave to the present one about that time. There was a window of similar design at Chartres and St. Denis, which allowed him to date the window 1130, or very near. Those three examples were the earliest examples of that design, which ultimately became so common and so full of beautiful variations. As an example of the finest work of its period it occupied a very important position in art, and it might with advantage be placed in a more accessible position and covered with plate glass both within and without. A student of historical ornament, he said, after further criticism, confined in York Cathedral would have sufficient example in the glass alone to give him a fair education.

Mr. Micklethwaite said it was wonderful that the Minster had preserved its glass after two such fires as had occurred during the last hundred years.

Bolton Castle.

On the 23rd a party numbering something short of a hundred went on from Northallerton by special train, and reached Bolton Castle at eleven o'clock. It was the home of Mary Queen of Scots during part of the time when she was in the custody of Lord Scrope. Part is now tenanted by a keeper on the estate. Mr. W. St. John Hope said:—In the reign of Richard II. it would seem that the Lord of Bolton (John Scrope) and the Lord of Middleham (Ralph Neville) had a building match. The Lord of Middleham lived in a mighty tower on the other side of the valley, and had encircled it with a great wall of new buildings, of which he was very proud. The Lord of Bolton lived in a much humbler abode, and thought he would have a new house. Up to this time the great people had lived in houses which were really fortresses, consisting of a great tower, which sometimes included comfortable rooms and quarters for the garrison. By the end of the fourteenth century the discomfort of living under these conditions had been realised, and a new style came in, and Bolton Castle was, he believed, the earliest example of the new form of house opened out in the middle. They had seen another on the previous day at Wressle, and it would be noticed in the present case everything was rather more severe. This

was accounted for by the fact that it was very much nearer the Scottish border, and had to be more in the nature of a fortress. Mr. Hope explained the arrangement of the castle, with its four towers, one at each corner, coupled up with ranges of buildings, in which were the chief apartments. The historian told them that it was eighteen years in building, and the expenses every year came to 1,000 marks, which would be a very large sum. It was finished before 1399. A very interesting document in French was in the possession of Lord Bolton, the contents showing it to be an indenture between Sir Richard le Scrope, knight, and John Lewyn, mason, in which the latter undertakes to "do the works at Bolton in Wensleydale in the following manner." Its date was September 14, 1378, and they were entirely dependent upon private documents like this to discover the castle's history. Sir Richard did not actually get leave to crenellate until July 14, 1379. Mr. Hope read the document, and pointed out how the plan of this house resembled that of the castle within whose walls they were standing. The chief portion of the translation was as follows:—

"In the first place, a tower for a kitchen, which shall be vaulted and embattled, and shall be of a height of 50 feet below the battlement, and shall be in length of 10 ells and in breadth 8 ells, and the outside walls of the said tower shall be of a thickness of 2 ells. Also there shall be made between the said tower for the kitchen and the gate a house vaulted and embattled, and above the vault shall be three chambers one above the other, and each chamber shall be of the length of 12 ells and in breadth 5½ ells, and the said house shall be of a height of 40 feet below the battlement, and the thickness of the walls outside 2 ells and within 4 feet. Also there shall be an embattled tower which shall be of a height of 50 feet under the battlements, in which tower there shall be a gate vaulted, and above the gate shall be three chambers, one above the other, and they shall be in length 10½ ells and in width 5½ ells. And in the same tower on the side of the gate towards the south shall be a vaulted chamber, and over that chamber shall be three chambers, one above the other, which shall be in length 13 ells and in breadth 7 ells, and the walls outside of the said chambers shall be of a thickness of 6 feet and within of 4 feet. Also there shall be a chamber adjoining the said tower on the side towards the west, which shall be vaulted and embattled, and of a height of 40 feet under the battlement, and over the said vaulted chamber another house, vaulted, and above that a chamber which shall be in length 10 ells with the entry and 5½ ells in width, and the walls without the said chambers shall be of the thickness of 2 ells and the walls within of 4 feet."

The document also gave other details as to material and price. Mr. Hope drew attention to the extraordinary doorways, each of which had been defended by a portcullis, and afterwards led the way through the chief rooms, many of the visitors going to the top of the castle, from which there is an expansive view of the district.

Sir Henry Howorth afterwards expressed the thanks of the Institute to Lord Bolton for the facilities given them. Touching upon the history of the Scropes, he said he shuddered sometimes to think what would have happened if the battles at the end of the great Civil War had not broken the back of the harpies who, after all, had become a most desperate danger and nuisance to the realm.

Middleham Castle, once the residence of kings and the Kingmaker, and known as the Windsor of the North, was next visited. Mr. St. John Hope said that its predecessor stood upon the hill at the back, and was one of the moated mounts they had reason to believe formed a great series of blockhouses which the Conqueror planted about the country. The first Middleham Castle on the hill never had any masonry about it, and was fortified with nothing but wood, and a century elapsed before the one they were visiting was erected. Mr. Hope commented upon the building of the tower within the space surrounded by the outer walls, and said that if the tower were out of the way they would have a plan almost exactly like Wressle and Bolton. The outer work was apparently begun about the middle of the fourteenth century, and the chapel, which was added to the tower, though built in the fourteenth century, was in the Norman manner. After the death of Richard III. it passed into the hands of the Crown. Mr. Hope read the details of a survey of the castle made for the king, in which the various repairs necessary were given in detail, and said that the existence of this document helped them materially to follow the lines of the original building. The tenacity of the masonry was very remarkable, but it was advisable that the owner should support the projecting portions by plain pillars of ashlar. Middleham was a very fine example of the great towers of masonry, started in the reign of William Rufus.

Sir Henry Howorth thanked Lord Masham for allowing the Society to visit this historic place, and said they were thankful also to their expert guide, Mr. Hope. He would, however, like to say that they considered that a great part of the castle was in imminent danger, and unless very careful attention was

given to it, a great part would soon be an absolute ruin. They were not all agreed on the question of the ivy, but when the very entrails of the castle were exposed, it was an undoubted danger. Lord Masham, they thought, ought to preserve this great historic monument by having it tended by careful hands.

Howden Church.

Howden was visited on the 24th inst. The church, once one of the most dignified and beautiful in England, is now partially in ruins, only the nave and transepts being intact. Under the guidance of Mr. John Bilson, F.S.A., who has the work of restoration and preservation in hand, the visitors were enabled to gather what the beautiful edifice was like in the days of old.

Mr. Bilson prefaced his remarks by reading extracts from an article in the *York Archaeological Journal*, by the Rev. W. Hutchinson, a former vicar of the parish—an account of the rise of Howdenshire. The group of townships, the article states, in the fen country around Howden, lying to the north of the Ouse, just above its junction with the Trent, is mentioned in a grant of King Edgar of 959. This grant mentions eight townships as belonging to Howden, and they formed the nucleus of Howdenshire, the name of the parliamentary division now represented by Sir W. H. Wilson-Todd. At a later date they came into the possession of the abbey of Peterborough, but in 1082 William the Conqueror granted the shire of Howden to William of St. Calais, Bishop of Durham. This connection with the see of Durham had an important effect on the later history of the church and shire. The Domesday Survey mentions some eighteen townships in the hundred of Howden as being held by the bishop, and this holding seems to have been increased by the time of Kirkby's Inquest (1284-85), which mentions some twenty-five townships or hamlets as held by the bishop. On the south side of the church is the manor-house of the bishops, which is one of the three houses of importance which they had in Yorkshire, the other two being Crayke Hall, in the North Riding, and Weel Hall, near Riccall. Within the walls of this house Bishop Hugh de Puiset (or Pudsey) died in 119(4)5, and Bishop Walter de Kirkham in August 1263. The latter was buried in the chapter-house in Durham, but his viscera, which was probably removed for the purpose of embalming the body, a process which has been carried out in the case of the late Pope of Rome, were buried under a grave cover of Frosterley marble in the south transept of Howden Church. The stone bears a raised cross and an inscription in Lombardic characters. Bishop Walter of Skirlaw, who was a munificent benefactor of the church, and built the splendid hall of the manor-house, died here on March 24, 1406, and was buried at Durham. In dealing with the architecture of the church, Mr. Bilson said he would like to call attention to a fact bearing on architectural development, a point somewhat neglected. Up to the middle of the thirteenth century the architecture of England ran parallel to the architecture of France, and he pointed out that there was a good deal of French influence in the tracery of the windows. It was not an improvement, but it led up to the flowing form which began in 1315. In France that was not reached until a considerably later date. That form in the window tracery was a perfectly English development, and led on to what was nicknamed Perpendicular, which was also English. Mr. Bilson then, in a highly interesting manner, pointed out the architectural details of the church, and said that there was evidence that the choir was built before the transepts—not the present choir, but one which preceded it. From the nave the party were conducted into the choir, the walls of which only are standing, and they surround now an addition to the burying-ground. The "Chronicle of Lanercost," under date 1272 says:—"About that time a certain prebendary of the church of Howden, named John, a man of quiet life and living without ostentation, skilled in astrology, given to hospitality and charity, passed from this world. He at his own cost began the new choir of the church. What was left over he predicted he would finish after death, and we see it clearer than daylight. For being buried in a stately tomb in the middle of the choir itself, he is held for a saint, and from the offerings of the thronging people we see not only the choir but a spacious and elaborate nave in the course of completion." The choir which was left unfinished in 1272 could not be the existing choir, the style of which pronounced it to be some thirty years later. The magnificent tower, Mr. Bilson pointed out, was built by Walter of Skirlaw to a great height, which tradition says made it a refuge for the inhabitants in the time of floods. He rather regarded that as a cock and bull story, although he was told that floods had been known to come up there. School buildings were added to the church later in the fifteenth or early in the sixteenth century, which was interesting to note, because it had been continuously used as a school up to the present day.

Sir Henry Howorth, before leaving the choir, said that they were met there for two purposes—to study those splendid buildings and to help those who in a poor Yorkshire village

found themselves in difficulties in the custody of a magnificent building such as that; and in Yorkshire, where there were such splendid minsters to preserve. He would like it to go forth that they expressed a strong feeling that that was one of the great Yorkshire churches, and should be preserved in every possible way. It was one of the real treasures of the county, and he knew the difficulty of the clergymen in raising enough money to preserve the ruins and to keep the other part of the church in proper repair. He did not make an appeal because they were not wealthy people, only students, but their duty was to make known to wealthy people that it deserved careful, sympathetic and conservative treatment.

Wressle Castle.

The castle was built in the reign of Richard II., and belonged to the great family of Percy. During the Civil War it was garrisoned for the Parliamentarians, and in 1648 fifteen men were employed to demolish the stronghold. A letter was then written by Wm. Blackstone to Prickett, of York, lamenting the work of ruin that was going on, and saying that the owner had better have paid 120*l.* than it should have taken place. The dimensions and points of interest about the ruins were described by Mr. Bilson.

Sir Henry Howorth said that they could not stand on such ground without general thoughts passing through their minds. In the first place, it took them back to that most important of English reigns, that of a very able king if he had not been overwhelmed by his nobles—Richard II. From that reign great changes could be traced in our English life. Richard married a princess of Bohemia, who brought in new fashions in dress, amongst which boots with such long toes that they had to be tied in knots, and which the "mashers" of that day pressed to the fullest extent. Alluding to the fact that over 200 retainers used to be kept at Wressle, he said that he was staying with the Earl of Derby at Knowsley the other day, and was talking to him about the Derby and Percy families keeping up a number of retainers, and he said he had the largest establishment in England with the exception of Windsor Castle. He explained that in the old days they had to move about from one great house to another or else it would have been impossible for them to have found the means of living. Sir Henry then went on to explain that a mistake was often made with regard to the object of moats. No doubt in embattled and fortified houses they were meant for protection, but in a vast number of cases they were used not for protection, but as ponds in which to keep a store of fresh-water fish. Dr. Hutchinson, who was engaged in inquiries with regard to leprosy, had traced it to the eating of bad fish. The long fasts in Lent compelled people in villages to salt the fish, which turned bad, and consequently every village had its leper-house. The Reformation did away with leprosy. The Mediaeval scourge of scurvy also disappeared with the leprosy. This disease was caused by eating badly salted meat in the winter, when people were unable to keep cattle. The diseases were not caused by bad drains but by bad food.

Selby Abbey.

Mr. J. T. Micklethwaite, F.S.A., undertook to describe this magnificent church, the one great Benedictine monastery of the North of England which survives as a parochial church. Mr. Micklethwaite briefly touched on the three orders of monks—Benedictine, Cluniac and Cistercian—and then proceeded to explain that that abbey was founded in 1069, and also described the manner in which the monks built their places of worship. They first got ready the portion where service was held—the choir—then built the cloisters or living portion and then went on to complete the church by building the nave. They regarded the church as the Puritans did their religion, always in need of amendment, and he pointed out the changes of fashion which were to be seen. In looking for some details to which he desired to call attention, he said "Oh, they are gone; the restorers have been here." In noticing the superb east window, he said much of the old glass was there. It was taken out and laid in the vaults, and some quarter of a century ago it was replaced and mixed with newer work, which was extremely well done. The details of the church were very rich, and there had been some very charming screens which had disappeared. He spoke of the unique cupboards with sliding doors on the north side of the sanctuary in which the plate of the abbey was kept, probably to be in readiness for decorative purposes on high days and holidays. The monks did not invite ladies to drive nails into their beautiful screens and attach a lot of nonsense to them.

The Rev. A. G. Tweedie said he took the whole of the responsibility of what had been done for preserving the ancient work, and they had been actuated by the one motive of preservation. It was not a quarter of a century ago that the old glass was replaced, but twelve years ago. There was more old glass in the window than new. It was the most beautiful window in the whole of England, and the new work would compare favourably with the old. The screens had not been

removed; nothing had been taken away. In some excavations which were carried out he found the foundations of the Norman choir, which was apsidal with apsidal aisles. The rev. gentleman then conducted the party around. He took them into the sacristy, pointing out a peculiar lavatory, and saying that there was not a piscina in Selby, and that was probably where the ablutions were performed. Above the sacristy was a small room supposed to be the scriptorium. The sedilia, on the south side of the sanctuary, is a work of extreme beauty. The canopies were missing up to the time of the late restoration. They were restored and copied from those in Durham Cathedral. Mr. Tweedie pointed out in the lower portion of one of the lights of the east window a figure bearing the name Sarasam, which he said was not to be found in Scripture. One antiquary wrote to him saying that it was Sarah, wife of Abraham. He replied that the figure had a beard, which did away with that theory. Another object of great interest was a portion of a stone coffin, in which was buried Alexander, one of the abbots, who died after he had resigned. The other portion of the coffin is in the museum at York. The abbot's skeleton was found during some excavations twelve years ago.

Sir Henry Howorth thanked Mr. Tweedie for receiving the party, and said they felt the beautiful building was in the tenderest of hands.

Clifford's Tower, York.

The company assembled in the open space within the walls to hear an account of its history.

Mr. W. H. St. John Hope said Clifford's Tower was another excellent example of the moated mount, and was, they believed, put there by William the Conqueror to dominate the town. The Old Bail Hill on the other side of the river, with this castle gave complete control and prevented the Danes coming up the river. During the recent work at the tower there had been brought to light remarkable traces of the defences which originally stood on the mount. They were told that the place was stormed and destroyed in the revolutions on more than one occasion, but they had only to clear away the burnt wood and put up more railway sleepers.

Mr. J. T. Micklethwaite attributed the existing wall to the time of Henry II., and said that originally there were no doubt buildings inside, chiefly of timber. The prison part had at different times been rebuilt, but the tower itself had always been preserved as a relic. Seventy or eighty years ago some ingenious people cut away part of the mount to make a road, and as a result the weight of the building was too much for the earth, and it bade fair to go down into the yard below. He was asked to come down and consult with Colonel Beamish, official surveyor of such buildings, and there was no shadow of doubt that the mischief was not in the walls but in the earth below. They agreed to report that it was a matter to be dealt with by an engineer who was accustomed to deal with earth pressure, and in the end an arrangement was made to carry out certain repairs. The whole of the moving part had been buttressed up, and he believed that part of the wall was now safe from further movement. He would not say that the whole castle was, because the cutting away of the toe of the mount extended to the other end. There had up to now been no sign of movement, and they hoped this state of things would continue. In the course of the work some curious things were found, including the stones on which he was standing, most of them thirteenth-century work. At present, except that some few seemed to belong to the chapel, they could not say really what they were. Below the ground on which they were standing were a series of piles and rails joining them, and this was believed to be the palisade of William's castle, which Mr. Hope had told them about, and he believed it was there below their feet. When these stone walls were built the mound was apparently heightened, and the piling was no doubt left to stiffen the new earthwork. He thought a little investigation to help them to plan it out would be well worth doing. As the Yorkshire Archaeological Society had from time to time undertaken to investigate the work, they might put their hands in their pockets and spend a little on this work. It would be most interesting to find the actual wooden fortification of the eleventh century.

St. Mary's Abbey.

Mr. W. H. St. John Hope dealt with the history of the abbey, and said that owing to the unique character of these remains in this country it behoved them to take every care of them. These foundations which had been recently opened—he used the word foundations advisedly—were beneath the floor of the first church, and were not intended to be seen, consisting simply of coarse rubbish put in to support the superstructure. When the foundations were first exposed he happened to come over and see them, and he was asked what had better be done to preserve them. There were one or two courses open. The first was to bury them again. The Society did not want to do that after spending money in laying them open. Then there was the second course, which had been

adopted for this reason. These beautiful gardens formed a delightful playground for the children of the subscribers, and it was obvious that if they left these rough foundations in a very tender condition, like all newly-excavated work, the children would run on them and reduce them to a more or less shapeless mass. Obviously the first thing to do was to make secure in its place every one of the original stones, and that was what he suggested should be done with blue-lime, the mortar being put in with a stick and not with a trowel. They must not use cement, which was right and proper in its place, but when put between old stonework it had the fatal disadvantage that, owing to its expansive properties, it sooner or later came out. The last state of that work was, therefore, worse than the first. Seeing that the remains were standing up to various heights, he suggested that they should be brought to a common level with brickwork, the advantage of this being that there was no confounding brickwork with eleventh-century rubble. If they had used stone, it would, after some years, have assumed very much the same character as the rubble, and it would have been difficult in future ages to distinguish them. Having done that, they had to guard against rain and frost, and the best way was to cover the top with these magnificent Yorkshire flags. As a result, all this work had been anchored down for posterity. Mr. Hope went on to suggest that the areas which were originally within the church should not be turfed, but would have been better covered with gravel, otherwise he could not see that any other method could have been better.

Mr. J. T. Micklethwaite agreed with Mr. Hope as to the method adopted, and said, incidentally, that the man the archaeologist had to fight against was the man who worked for an ignorant public. They had to convert them, and make them understand that there was something of greater value than the ornamentation of a garden. There was a man called Brown, who seemed to regard ruins as incidents in gardening, but he was dead now, and no doubt doing time for it. He would much rather that these remains were buried again than treated as some who had taken part in the recent controversy wanted to treat them. If the work could not be done properly, as Mr. Brierley had done part of it—there were little details on which he might differ—the best thing to do was to bury them altogether.

Mr. J. Bilson urged the carrying out of excavations on the opposite side, so as to clear up the history of the middle part of the building. There was no other building like this in the country, the analogies being in France. No architect could have put the points more clearly than Mr. Hope. By covering up the plan they would be depriving their descendants of the opportunity of studying them. He had done precisely the same thing at Howden with regard to flag covers, and they could not see the top of the walls, and water could not get in and no one objected. Last year he had the privilege of taking over the excavations at York M. le Comte de Lasteyrie, professor of archaeology at l'Ecole des Chartes, Paris, and a member of the Commission des Monuments Historiques. There was not a man in France whose opinion would carry more weight, and he expressed cordial approval of what had been done, and expressed a wish that all the foundations might be treated in the same manner. Mr. Bilson said he hoped the Philosophical Society would excavate the opposite side, so that they might add to their records.

M. Camille-Eulart (formerly librarian of l'Ecole des Beaux-Arts, now director of the Museum of Comparative Sculpture at the Trocadéro, Paris, and a member of the Commission des Monuments Historiques) suggested that the stones with parts of sunk quatrefoils built into the wall of the thirteenth-century aisle of the choir might possibly have formed part of a pavement, and the incisions might have been filled in with coloured cement. He cordially approved of the methods adopted for the preservation of what had been found. The report was derived from the *Yorkshire Herald*.

ST. BARTHOLOMEW'S HOSPITAL.

THE following report of the Mansion House committee on St. Bartholomew's Hospital has been issued:—

At a meeting of the appeal committee of the Governors of St. Bartholomew's Hospital, held at the Mansion House on January 19, 1903, the Right Hon. the Lord Mayor being in the chair, the following resolution was passed:—"That, having regard to the criticism upon the proposed appeal for the enlargement of St. Bartholomew's Hospital, based on inaccurate information, a committee be appointed to report—(1) Whether it is desirable in the public interest and on financial grounds to retain St. Bartholomew's Hospital on its present site; (2) in the event of the retention of the hospital on its present site, whether any better scheme of rebuilding than that suggested by the Governors can be devised; (3) upon any other matters affecting the hospital that the committee may think it desirable to inquire into. That such committee do consist of

fifteen members, nine to be nominated by the Lord Mayor and six by the Treasurer of the hospital, and that the Lord Mayor and the Treasurer be *ex officio* members of the committee."

In accordance with this resolution the following nine gentlemen were nominated by the Right Hon. the Lord Mayor, viz.:—The Right Hon. Lord Sandhurst, G.C.S.I., G.C.I.E., chairman of the Middlesex Hospital, late Governor of Bombay; the Right Hon. Sir William Hart Dyke, Bart., M.P.; the Right Hon. Sir Savile Crossley, Bart., M.P., hon. secretary of King Edward's Hospital Fund; Sir Thomas Jackson, Bart., formerly chief manager of the Hong Kong and Shanghai Bank; Sir William Emerson, past president of the Royal Institute of British Architects; Dr. Pye-Smith, F.R.S., vice-chancellor of London University, consulting physician to Guy's Hospital; the Hon. Alban Gibbs, M.P.; Mr. Richard Biddulph Martin, M.P.; Mr. Arthur Hill. Sir Trevor Lawrence, as treasurer of the hospital, nominated Mr. Alderman Alliston, Sir William Church, Bart., K.C.B., president of the Royal College of Physicians; Mr. Benjamin L. Cohen, M.P.; Mr. Frederick Morris Fry, a member of the committee of King Edward's Hospital Fund; Mr. John Cary Lovell, Alderman Sir William P. Treloar. The Lord Mayor, as chairman, appointed Mr. Graham Tahourdin to act as secretary to the committee.

The committee proceeded to examine the questions submitted to them, and beg to report:—

(1) As to hospital site.—The committee investigated this point very fully. They received and examined a large amount of evidence given both by inhabitants of the neighbourhood and by others, and they came to the conclusion, with only one dissentient, that it was impossible in the public interest to entertain the idea of removing St. Bartholomew's Hospital from its present site. In this connection they went thoroughly into the question of St. Luke's site, and came to the conclusion that such a removal, even were the site available, would not give the results its advocates anticipate, and that on that site the hospital would be cramped for room and not able to perform its duties even as efficiently as at present. No evidence was brought forward in support of this plan that commended itself to the committee. The committee proceeded to investigate with great care and with the assistance of evidence from competent persons the value of the present site of the hospital. They came to the conclusion that the value of the site of St. Bartholomew's Hospital has been much exaggerated, and that there would be very little, if any, ultimate money profit to the hospital in removing the building from its present situation to any other locality.

2. As to buildings.—The committee next carefully considered the present buildings of the hospital, and the necessary additions demanded by the medical and surgical staff. They are satisfied that important additions to and a considerable rearrangement and improvement of the existing buildings are necessary, and they consider that with the additional land purchased from Christ's Hospital there will be ample room for the provision of a hospital with every modern appliance. The committee, having carefully examined the several plans placed before them, consider that a thoroughly efficient hospital can be provided by a gradual building scheme under which the improvements and alterations contemplated can be secured so soon as funds are obtained. The committee are assured of the great value of the medical school to the hospital and the public. For the continued efficiency of the treatment of the patients, the teaching in the school and the advancement of medical science, greater facilities for research and teaching are absolutely necessary, and call for additional accommodation.

3. The committee also carefully examined the financial position of the hospital itself. The evidence showed that its properties and revenues are judiciously and economically administered, and that the cost per bed compares favourably with that of other hospitals. They find that it is impossible to hope that funds for the additions to and rearrangement of the hospital can be obtained from the resources of the hospital itself. Indeed, the recent purchase of land from Christ's Hospital will entail a charge of over 9,000*l.* per annum on its present revenue, leaving a deficit of 7,000*l.* per annum on the ordinary expenditure. The committee recommend that the rebuilding of such parts of the hospital as are most urgently needed be proceeded with so soon as sufficient funds are collected. They consider that the Governors of St. Bartholomew's Hospital are fully justified in appealing to the public for assistance, and they heartily commend this appeal to the consideration of the citizens of London and to the public generally. The committee do not think that they would be justified in concluding their functions without placing upon record their opinion that from the evidence brought before them the administration of the hospital has been conducted by the Governors in a wise and enlightened spirit, with a due regard to economy and in the best interests of the patients.

MARCUS SAMUEL, Lord Mayor,
Chairman for and on behalf of the Committee.

July 27, 1903.

For the purpose of showing the reasons on which their conclusions are based, the committee append a full statement of their proceedings, and of the evidence taken by them. They note particularly that not one single witness came forward voluntarily to advocate the removal of the hospital from its present site, and they express surprise that no application to be heard was received from any of those who had written and spoken so strongly on the subject. On the other hand, no difficulty was experienced in finding witnesses in support of the case for the retention of the hospital on its present site.

FIREPROOFED WOOD AS A BUILDING MATERIAL.*

IN the construction of large buildings the question of fireproofness has at last assumed its proper position at the head of all other questions concerning the manner of construction.

As representatives of this twentieth century we congratulate ourselves upon our advanced civilisation and our industrial and scientific development; but it is a lamentable fact that numerous problems of vital importance to the life and happiness of our race are still unsolved through stupid neglect.

Two of these problems are fireproof construction and sanitary regulation of disease. There is little cause for complacency over these subjects when contrasting the world's condition to-day with that of two or three centuries ago.

Fortunately we are at last waking to the gravity of the situation, and material advancement has been made in the past decade. It has taken us 2,000 years to learn that great conflagrations are the result of human neglect and ignorance rather than visitations of Divine wrath. The same is true of widespread plagues and distributed malignant diseases.

We have made marvellous progress during the past few hundred years in the method and magnitude of our building operations. The introduction of iron and steel into this class of construction marked an era in architectural history. With their advent came the use of the term "fireproof construction." It was fancied that steel beams, iron columns and tile or concrete floors would make a building indestructible. Alas! we know to our sorrow that the term "fireproof" is often a delusion. Buildings, as generally constructed during the past twenty-five years, were no barrier to fires, and, as a matter of fact, not so safe as if built of solid wooden beams. These would at least be slow-burning and not wreck the whole building by the buckling of columns and beams as soon as heated.

Our cities are filled with magnificent structures, marvellously constructed, but a very small percentage of them are at all fireproof. It is absolutely true that our great cities to-day are but little less inflammable than they were in 1666, when this city was swept by fire from Tower to the Temple, with results sufficiently awful to make a period in history. Similar conflagrations have occurred with painful frequency all over the world since that time, and now, after a lapse of 250 years, are still of yearly occurrence. Were it not for the high efficiency attained by the noble body of men, the firemen, in all our cities, consequences of fire would be far more appalling than they are. This is particularly true in America, where the craze for high buildings has made the fireman's work doubly hazardous.

The time has come when all permanent construction should be strictly incombustible. That the public has awakened to this fact is evidenced by this gathering of representative men from all parts of the world to discuss the various methods of solving the problem.

The necessity of fire prevention is beginning to be appreciated. Energy and money are freely spent in exploiting all kinds of fireproof construction. Fortunately the public has lost its credulity and no longer accepts the statement that a system of construction is fireproof unless it is proven to be such by practical test. Your chairman is one of the pioneers in this class of experimental testing. His splendid work during the past few years by siting the meritorious processes from numerous trashy ones has aided greatly in classifying the many proposed methods of fire protection.

In the United States during the past few years much investigation of this character has been done by the New York City authorities, also by the National Board of Underwriters at their testing laboratory in Chicago, and by the Insurance Engineering Experiment Station in Boston. All are doing excellent work. I am informed that much similar work is being accomplished by experts in various continental cities. I regret that I have been unable to secure records of their work.

If this class of investigation receives the support it deserves, the results will be invaluable, and reduce to a minimum the fire hazard of large buildings. Among the various materials for reducing fire risk is the so-called "fireproof wood." It is

* A paper prepared for the International Fire Prevention Congress by Professor Ira H. Woolson, Columbia University, New York.

upon this subject your executive has kindly requested me to address you to-day.

First of all, let us have a clear understanding of what is meant by the term "fireproof wood." For the information of those unfamiliar with the subject, it should be stated that the term "fireproof wood" is a misnomer; for all such woods will burn if exposed for a sufficient time to a high degree of heat. Strictly speaking, the processes of treatment do not make the woods fireproof, but simply render them fire retardants. Fire-resistant wood is a much more logical term. The public has been somewhat deceived by the representatives of certain processes who make the silly claim that woods treated by their methods are rendered absolutely incombustible. Such statements are foolish, for they lead to expectations of resistance which cannot be achieved. When the deception is discovered it causes unjust criticism and mistrust of the whole product.

The term "fireproof wood" is a trade name, and should not be taken in a strictly technical sense.

New York city is probably now using more fire-resisting wood than any city in the world. This results from two causes: first, the Building Law, which requires that such treated wood shall be used throughout all buildings over twelve storeys (or 150 feet in height); and, secondly, to the fact that the city proper is too limited in area to spread, and enormously high buildings have become necessary. Scores of buildings erected during the past two or three years are over fifteen storeys high, and many of them twenty-five and thirty.

It has been my privilege, under the direction of the Bureau of Buildings, to test most of the wood which has been used in these buildings. For the year ending the first of this month I have tested and reported upon upwards of 3,500,000 feet. The greatest part of this material was for floors, which were laid on the top of strictly fireproof floor construction of concrete or hollow tile. The balance of the material was used for trim. An evidence of the magnitude of building construction now going on in that city is the recent filing of plans with the Bureau of Buildings for one structure in which 2,000,000 feet of fireproofed wood will be required.

I would here add that there are at present three companies supplying this treated wood to the city of New York. There are other companies established for the same purpose in Philadelphia.

The impregnation of wood with chemicals to render it fire-resistant is by no means a new idea. Numerous experiments with various chemicals were made as early as 1825 by Fuchs, Gay-Lussac, Boucherie, and later by Löchlin and other continental chemists. However, it is within the last few years only that the business has been put upon a practical commercial basis.

It is conceded, by most experts who have carefully studied the subject, that the fireproofing of wood is a safeguard, and under ordinary conditions will greatly reduce the fire risk. It will, however, be consumed by continued application of flame, and under certain conditions especially favourable to fire may support a slow combustion by itself, but the same conditions of heat would also ruin many other accepted fireproof materials. To my mind, the non-inflammable nature of the material is its greatest value.

When a fire occurs in a room trimmed with ordinary wood, its inflammability makes it immediately dangerous. The flames leap from one point to another, dashing through windows and transoms, thus spreading the fire to adjoining rooms. If the wood is finished with oil or varnish, the flames will run along it with marvellous speed. If finished with well-treated wood this tendency of spreading the flames is reduced to a minimum; even if the burning material in the room is sufficient to ignite the treated wood, it burns so slowly that life and property are much less menaced. It would at the worst be a distinctly slow-burning conflagration. That in itself is a great safeguard, because it allows time for the arrival of the firemen.

Numerous inorganic materials are being exploited to replace wood entirely in fireproof construction. If it were possible to find a substitute for wood, which possessed its merits and none of its failings, it would be most desirable. So far, I have never seen anything which had the lightness, strength, durability, cheapness, ease of working, and last but not least, the elements of beauty for decorative purposes which wood possesses. For these reasons it will surely long remain a favourite with architects.

Granting the value of fire-resistant wood as a structural material, the next problem is to determine what degree of fireproofness should be exacted, and how the standard of quality can be maintained.

Not being acquainted with the methods employed on this side to accomplish these objects, I will confine my remarks to our practice in New York.

In the early stages of experimentation it was customary to build a small house of the wood to be tested, usually duplicated by a house of untreated wood; then applying a vigorous fire both inside and out and noting results. This method possesses

spectacular elements which are very convincing, and while it may be useful as a general test to demonstrate the degree of immunity from fire that a wooden building may be made to possess, the heavy expenditure of time and money required for such a test precludes the possibility of employing it for regular series work. This is the only value such a demonstration possesses, for the results of fire tests made upon wood treated a year or so ago may bear no relation to the product of the same company to-day. It is essential for public safety that regular serial tests should be made upon all material delivered for use, as is the custom in the manufacture of steel, cement and other structural materials.

Unfortunately there is no recognised test for fireproofed wood. In America a variety of tests have been proposed by different investigators, most of them being the direct application of heat or flame to small test specimens, and noting the duration of flame and glow produced, as well as the amount of wood consumed. One method recently proposed makes the amount and character of gas given off from dry distillation of small fragments of wood a basis of classification, but no uniform method has yet been adopted.

An effort was made a year ago by the Building Bureau of New York city, in conjunction with the various fireproof wood manufacturing companies, to decide upon some standard method of test. But the project was abandoned. The present method of testing is as follows:—

When a shipment of lumber is prepared, an inspector proceeds to the works and selects at random one sample from every 2,000 feet of material. This is sent to the laboratory and tested, reports being sent to the Building Bureau and the manufacturer. Two tests are applied to each sample. One a "shavings test," which is a test used by the United States Navy, and the other a test devised by the writer, which for want of a better name is called a "timber test."

The shavings test, while useful in a general way to determine the flaming properties of treated wood, is nevertheless unsatisfactory. We are now making series of different tests in an endeavour to supplant it with something more reliable. The test is conducted as follows:—A pan 1 foot in diameter and 6 inches deep is mounted on legs. The bottom is formed by a heavy wire screen of $\frac{3}{8}$ -inch mesh. This wire bottom is covered with a layer of shavings 2 inches deep, and a Bunsen burner is applied underneath for twenty-five seconds; then the burner is removed, and the lengths of time during which the shavings support (1) flame and (2) glow are recorded, and also the area of shavings burned.

The idea of this test is that shavings from properly-treated wood will not support flame any considerable time, and that the flame will gradually die out without material enlargement of the burned area. After test, the remaining shavings are thrown away. There are no means for making a permanent exhibit of the results, except by photographs, which would be difficult to take and quite unsatisfactory. The wood must be accepted or rejected on the judgment of the operator, based upon notes taken while observing the test.

Besides these obvious disadvantages, there are two other strong objections to the shavings test: first, the extreme difficulty of always maintaining the same conditions of flame and heat under the shavings; and second, the impossibility of securing a uniform quality of shavings for tests. The Navy specifications call for the use of the Bunsen burner with a flame giving about 500 degs. Centigrade = 932 degs. Fahrenheit. Now, Bunsen burners vary considerably in the size of flame they produce, so, although every precaution was taken and the same standard temperatures were determined in each of two flames at some definite point, the results of tests upon the same kind of shavings might show widely different figures because of the general variation in the character of the flames. Much depends also upon how and where the tests are conducted, whether under a smoke hood with a strong draught, or in an open room where air currents could strike the flame and cause it to sway. The most serious objection, however, to the shavings test, and the one which, in the writer's opinion, is fatal to its use as a standard method of comparison, is the impossibility of making the shavings of uniform size and quality. The samples here exhibited demonstrate the objection made.

These shavings were all made by the same carpenter and were as nearly alike as possible for him to make them. You will note that some are fine like sawdust, while others are very coarse, with all gradations of size between. Another objection is that in coarse-grained wood like oak, the plane, in making the shaving, splits many of the large pores and allows the crystallised chemical to fall out, thus removing a part of the fire-resisting agent. Lastly, no wood in the form of shavings would be exposed to fire in a building. It would seem that further evidence is unnecessary to demonstrate the inappropriateness of this test alone as a standard of comparison.

To avoid the difficulties of this and similar tests the previously mentioned "timber test" was designed. Though not entirely satisfactory, the results, as a whole, have been

gratifying. During the past two years the writer has conducted over 4,000 tests upon fireproofed wood, the majority being "timber tests." Scarcely any criticism of the method of test has been offered by clients, though the results were often not gratifying.

The specimens for this test are accurately cut to a size $1\frac{1}{2}$ inch by $\frac{3}{4}$ inch by 12 inch. These "timbers" are tested in pairs by being laid across the top of a 6-inch gas crucible furnace, in which a constant temperature of 926 degs. C. = 1,700 degs. F. is maintained. This particular temperature was chosen because it is given by the New York Building Code as approximately the heat of a burning building. At the end of two minutes the specimens are removed and duration (1) flame and (2) glow noted for each.

The temperature is under constant control by means of a Le Chatelier pyrometer, the "couple" being placed between the two specimens, thus recording the heat exactly at the point of application. The proportions of gas and air are regulated to furnish a vigorous flame 8 to 10 inches above the furnace, so imitating an ordinary fire.

After test the specimens are sawed in two at the middle and tracings made of the unburned wood. These tracings are then carefully measured by planimeter and the percentage ratios to the original cross-section calculated. The percentage of unburned wood is printed upon the tracing of each specimen, and then blue prints are made which become a part of the permanent record.

The accompanying exhibit contains samples of these blue prints, also a number of tested specimens of different varieties of wood both treated and untreated, showing the comparative results in each instance. It will be noted that the tested specimens show a straight line in the cross-section on the side not exposed to the fire, whereas the untreated specimens are burned on all sides. This is good evidence of the fire-resisting properties of the wood. In general the untreated woods show a cross-section area approximately 10 to 25 per cent. less than the treated samples. However, the value of the "fireproofed" wood cannot be rated by this feature alone. Account must be taken of the tendency to ignite and support combustion. This is indicated by duration of flame and glow, after the specimen is removed from the fire. In every instance the contrast in time of flame and time of glow between the treated and the untreated wood is very marked. The average duration of each taken from 688 tests on four varieties of treated soft woods was 7 and 12 seconds. The same data taken from 846 tests on four varieties of treated hard woods was 10 and 14 seconds.

Similar calculations based upon tests of untreated wood, though not averaged from nearly so many tests, gave for soft woods, flame, 1 minute 19 seconds; glow, 1 minute 53 seconds; and for hard woods, flame, 2 minutes 31 seconds; glow, 6 minutes 29 seconds.

Those figures give a ratio of 1 to 11 and 1 to 9 for flame and glow between treated and untreated soft woods, also 1 to 14 and 1 to 27 for hard woods. That is, the tendency of untreated woods to burn is ten to twenty times that of treated woods. This measure of the property of retarded combustion is as important as the determination of the percentage of unburned areas, for in the first stages of a fire minutes are valuable. Experience has shown that a variation of 5 per cent. should be allowed in cross-section area, because of structural differences in the wood, fluctuation in temperature and personal error in measuring. In fact, like all investigative work, it is never safe to estimate average values from the results of a few tests.

The advantages of this method of test are:—(1) A test piece of uniform size, large enough for practical comparisons, and small enough for numerous tests to be made with slight waste of material, thus insuring a fair average report; (2) a constant temperature and uniform time of application of heat; (3) an estimate of the tendency to support combustion as indicated by the times of flame and glow; (4) the ability to accurately measure the amount of burn, and make a drawing of same for permanent record; the specimen itself can also be easily preserved for future reference if desired. In brief, every element of the test is practically constant except the character of the wood and the treatment it has received. Necessarily, these must always remain variable.

The lumber is thoroughly dried before testing, and care exercised to keep everything uniform.

The specimens are placed so the side which was originally the outside surface of the board faces the fire. This is necessary because the Building Bureau permits one inch outside treatment on floor-sleepers and other large materials, which is encased in concrete or a coating of other fireproofed wood.

It will be noted that hard woods, like long leaf yellow pine, oak and maple, when treated, differ only slightly in unburned area from untreated lumber.

They are naturally "slow-burning" material. It would scarcely be necessary to fireproof hard wood if the preservation of structural strength were the only consideration. But the danger from inflammability should make a surface treatment

imperative. Soft woods which waste rapidly under flame should be treated throughout.

Although treated wood has many advantages as a fire retardant, it also has its failings, the worst being its tendency to become hygroscopic. There are processes which claim avoidance of this tendency to gather moisture when exposed to dampness, but I have had no opportunity to prove their merits. Because of this difficulty the Navy has discontinued the use of fireproofed wood, except for interior trim, furniture, &c.

When in this damp condition a new difficulty arises, because the chemicals employed produce a corrosion on metals. Neither of these difficulties appear harmful where the wood is ordinarily dry and protected by paint, varnish or oils.

A strong point in favour of the treatment is that the wood does not seem to become perceptibly more combustible by the application of oils and varnish. Among the experiments I will make at the conclusion of this paper is one designed to demonstrate this feature.

A further defect of treatment is to weaken the wood and make it brittle. Although this does not always result, it is a recognised possibility, and the Navy specifications reject material which has lost over 30 per cent. of its original strength.

In New York city no attention is paid to the question of strength, for the method of steel construction does not require the wood to support loads.

Whether the treatments are permanent, I am not prepared to state. Our experience with them is too short to predicate a positive opinion. Samples kept in my laboratory two years show no signs of deterioration, and we have here some samples treated in 1895, which we will test to show they still retain their fire-resisting qualities.

Some processes, however, do employ volatile chemicals, as is evidenced by a bloom which appears on the wood after standing for some time; it is also shown upon the sides of these jars of shavings which are about two years old. So far as my experience goes with lumber treated for New York city, there is very little tendency for this sort of deterioration. Neither has there been any evidence of decay. When used under ordinary conditions of dryness, and protected as it usually is, I see no reason why well-treated wood should not remain sound and effective indefinitely. However, I believe, the question is one to be systematically investigated.

There are two other well-known defects, namely, discolouration and difficulty in working due to hardness. Both of these are increased by excessive treatment, hence the manufacturer is always tempted to lessen the treatment. This fact is the only argument necessary for regularly testing the material as delivered for use.

Last, but not least, from a builder's point of view, the wood is costly. But considering the awful destruction of life and property which fire constantly causes, the saving of expense should not be allowed as an excuse for the use of inflammable materials which invite public calamity.

ARCHITECTURAL EXHIBITION IN NEW YORK.

A VISIT to the annual exhibition of the Architectural League, says the *American Architectural Record*, assuredly gives one a somewhat depressing idea of the interest which architecture inspires in New York city. At any one moment in the afternoon there will be perhaps from fifty to seventy-five people somewhat hastily and aimlessly walking around the galleries on Fifty-seventh Street. Of these four out of every five will be women—and women, if this can be said of any women, of no particular interest. Many of them look like professional followers of exhibitions, the kind that will go to any exhibition that is cheap enough and respectable enough. Half the remainder have the appearance of art students, or perhaps of friends or relatives of architectural draftsmen. What one rarely sees is a woman who has apparently any particular reason to be interested in architecture, one, for instance, who would be likely either to build or inhabit a handsome house. And the men put up even a less impressive appearance. There are, in the first place, not enough of them to justify the impression that architecture in New York was anything but an amiable feminine suburban fad; and the majority of those present seem to be either draftsmen or architectural students. Occasionally one sees a man who might be a professional architect in good standing or a well-informed amateur, but what one almost never sees is a man who looks as if he had any business, as apart from professional grounds for an interest in architecture. The men who draw the cheques and who pay for all these fine buildings, they are conspicuously and hopelessly absent.

If the people who go to see an Architectural League exhibition are, to put it mildly, inadequately representative of American interest in architecture, the exhibition itself affords an almost equally inadequate idea of the current work of the

New York architects. The great majority of the leading architects do not exhibit at all, and those who send drawings do so only sparingly, as if their purpose was to get off with as little exhibition and bother as possible. Some of the younger men exhibit more freely, and have apparently taken some trouble to display a fair proportion of their work, but this is true only of a fraction of them. One could never infer, either from the quality or the quantity of the drawings on the walls, that around New York as a centre there was now under way an unprecedented amount of building construction, that the character of these new buildings included large numbers of every prevailing type, and that the activity was particularly noticeable in buildings that make a brave show—in public structures of one kind or another, handsome residences, magnificent hotels and towering office buildings. No exhibition in the existing building could indeed accommodate more than a fraction of the big work which is now being constructed or soon will be completed; but the showing made this year is positively niggardly compared to the wealth of opportunity.

These remarks are not made with any intention of criticising the management of the exhibition on the part of the committee of the Architectural League. Probably no one recognises better than they do the inadequateness both of the attendance and the display. There have been better exhibits made than that of this year, but none in a different class as to representative quality and intrinsic interest. The facts are familiar. As it is this year, so it has been more or less from the start. American picture-shows are with certain exceptions poorly enough attended, and of course an exhibition chiefly of drawings cannot be made as interesting as a picture-show. There is very little popular interest in architecture as an art, and what there is expended chiefly in gazing aloft at the Fuller building. The character and volume of the attendance on the annual exhibitions do not offer architects many inducements to send in their drawings, particularly when they are so very busy that they are for ever trying in vain to catch up to the necessary and endless detail of their work. Whatever they do in the matter they do good-naturedly, out of a desire to assist a worthy purpose, but they do very little even of that. The arts of painting and sculpture as applied to architecture, and the industrial arts generally, are as meagrely represented. In this field the possible material, while possessing more popular interest, is not so abundant. In respect to the industrial arts, as far as original designs go, it is so very small as to constitute almost a negligible quantity. There is more architectural sculpture, but not very much that architects or sculptors have any opportunity to exhibit. Cartoons for mural paintings, and often the panels themselves are more numerous and form one of the most valuable parts of the exhibition; yet even here the things one has heard about and would like to see are very seldom on the walls there. In short the committee in charge are confronted by an extremely difficult and thankless task and find it impossible to obtain the cordial co-operation they need, either from the people who are doing much of the work or the people who are paying for it.

For our own part we fail to see how this state of things is to be remedied, except slowly—so very slowly under existing conditions that people might well decide in advance to get tired of waiting. Fortunately there is a chance at least of an important change of conditions. The Fine Arts Federation is endeavouring to raise money to erect a very much larger building than that now occupied on Fifty-seventh Street, a building so large that all the different art societies of New York can hold joint exhibitions under one capacious roof. There are no signs as yet that the very considerable sum of money will be soon forthcoming, but it is the kind of an idea which generally finds backing among the many liberal givers of New York city. None of the societies now making exhibitions in New York city would receive more benefit from this consolidation than would the Architectural League, just because none of the annual exhibitions needs for its popularisation more than does that of the League the assistance of a full representation of the allied arts. It cannot be expected that anybody except professionals will take very much interest in architectural drawings, and while, of course, an architectural exhibition would be absurd without a liberal display of such drawings, the exhibitions must depend for popular interest upon other classes of exhibits. It would be to the signal advantage of co-operative exhibitions that the architecture could be carried into greater public notice on the back of arts that have the advantage of displaying not merely drawings or photographs of the real thing, but the real thing itself.

Under such circumstances the exhibitions would surely arouse a much livelier interest on the part of possible exhibitors. A larger proportion of the architects who are doing the big work could be induced to show drawings and photographs, and what is equally important it would be much more to the interest of the many important houses who sell objects of industrial art to display the character of their work. The exhibits which come under this head even more conspicuously fail to represent the extent and quality of the current work than

do the architectural drawings, but if the exhibitions were held in a large building which supplied abundant space and which would attract in one way or another large crowds of people, it should not be difficult to induce the interior decorators to put on exhibit special rooms designed, arranged and furnished by their own people, which would prove exceedingly interesting to many thousands of people. Every year there are brought through New York by some of the Fifth Avenue importers many rare and valuable objects purchased abroad, and destined eventually for the rooms of some splendid private mansion, and surely these importers could be persuaded to send some of these mantelpieces, fabrics, furniture and architectural remnants to an exhibition which would be spectacular enough to attract the attention of thousands of people. Then, too, if the necessary money were available, it would be possible to devote part of the space to displays of a distinctly educational character, to the showing of well-designed typical rooms, which could be executed at comparatively small expense. Indeed this educational purpose is an essential part of the whole scheme, and could be developed in many other exceedingly interesting ways. The erection of a building such as the one proposed would in effect be the subsidising in the most effectual possible way the very important work of popularising the different branches of American art. It could and would form a better agency for that purpose even than a great museum, for it works with living forces and might produce living results. Provided it could obtain a sufficient endowment it would become in effect the art university of the country, the centre around which all the representative workers and progressive forces in American art could be grouped, and by means of which the impulse could be communicated both to the coming generation and to the uninstructed public. The idea is one of the greatest promise; it is peculiarly the product of American conditions and is based on the most approved American methods; it could be made to do as much, if not more, for architecture than for any other of the arts.

TESSERÆ.

The Battle of Issos.

IN last week's *Architect* there was a reference to the great Pompeian mosaic which Dr. Pernice supposed was derived from a painting by either Helena or Apelles. From what was said by Pliny, it was formerly believed to be a repetition of the celebrated picture by Philoxenus of that subject; for, independent of Alexander and Darius being the two most conspicuous figures, the design and composition of the work are so superior to the execution that its original has evidently been the production of an age long anterior to the degenerate period of the mosaic itself. With the single exception of the execution, the mosaic exhibits in every respect merits of the highest order, and is certainly one of the most valuable relics of ancient art. The composition is simple, forcible and beautiful, and its original, if not actually a production of the most renowned times of Grecian painting, still cannot have been far short of meriting the commendation bestowed by Pliny upon the battle-piece of Philoxenus, which was painted by order of Cassander, king of Macedon, about 316 B.C. The painter was a pupil of Nicomachus of Thebes, whom he imitated and even surpassed in rapidity of execution. He is said by Pliny to have discovered some more expeditious methods of operation in painting. He was the most rapid painter of antiquity.

Terrington St. Clement Church, Norfolk.

This is another of the gigantic parish churches; but it approaches far nearer than any other to the cathedral type, though it still remains quite as far from its complete realisation. Its nave and west front externally fully realise it, and it is not fair to mention its central portion as failing, for the transepts have been mutilated and the central tower, evidently designed, has been destroyed or never completed. But as usual the distinctive character of a minster is absent from the choir and from the internal elevations. It is, however, a most magnificent building, stately in itself and valuable as a study of the peculiar Transitional style of the district. The west front is of extreme splendour, fully equalling, if not throwing into the shade, those of Yatton and Crewkerne. Like them it consists of the extremities of the nave and aisles, each supported by turrets, but the proportion of the whole seems better than in either of the Somersetshire examples. The windows, especially the great window of the nave, are fine examples of the local intermixture of Decorated and Perpendicular tracery. The west doorway, on the other hand, is singularly small and plain for the general character of the composition. This splendid front, however, loses much of its effect by the close proximity of the campanile, which stands just detached to the north of it. This is a bold plain structure, evidently of much later Perpendicular date than the church, and probably erected when the design of completing the central tower was relinquished. It is

much to be regretted that its architect did not apply it to some such purpose as at West Walton instead of making it as it does almost entirely ruin this noble façade. The nave has seven bays and fourteen clerestory windows, and especially on the south side, which is most enriched, is a grand and well-proportioned structure. The transepts are the full height of the nave, but they have been shortened, and thereby have also lost the western aisles with which they were originally furnished. The choir has no aisles, and is every way inferior, having only reached the height of the main building by the addition of a later clerestory of brick. The internal effect of the church is very noble, but much simpler and plainer than might have been expected from the splendour of the exterior. The piers are plain octagons and the arches quite plainly chamfered, but their proportion, which is extremely fine, takes away any notion of rudeness or imperfection. The roof is rather high-pitched, but does not exhibit the genuine East-Anglian character.

Roman Colouring.

The crudeness of colour and asperity of tone observable in the Roman school, though founded on simplicity, is perhaps a greater proof of their want of eye and taste than of a pure historic principle. Harmony of colour consists in the due balance of all, equally remote from monotony and from spots. Though each part of Roman pictures be painted with sufficient breadth of manner, their discordance is such that they do not coalesce into one whole, but appear unconnected fragments in apposition. Their theory of shade is so defective that the parts deprived of light of the same body, or the same piece of drapery, are not effaced but coloured. If the positive reds and blues of the Roman school invigorate the eye, they likewise command it, and counteract the grandeur of history in a degree not much inferior to the bad effect produced by the imitation of stuffs discriminated according to their texture; their bright asperity and bleak purity equally pervert the negative and subordinate character of drapery, and attract a larger share of attention from the beholder than they deserve. A Madonna in the hands of Carlo Maratta, and sometimes even of Raphael, at least in his earlier productions, is the least visible part of herself. The most celebrated Madonna of Andrea del Sarto, though in fresco, is certainly more indebted to her drapery than her face, perhaps still more to the sack on which her husband rests, and from which the picture got its name. From this censure we ought to except Michel Angelo da Caravaggio and Andrea Sacchi, whose works, though else so dissimilar in principle and execution, coincide in reducing colour frequently to little more than chiaroscuro; the one for melancholy and forcible, the other for visionary or devotional effects. "The Pilgrims adoring the Madonna with the Infant," in Sant' Agostino, by the former, seem not painted but tinged in the last golden ray of departing eve, whilst the "Vision of San Romualdo," by the latter, surrounds us with grey twilight and gradual evanescence.

GENERAL.

The Prince of Wales, as president of the Society of Arts, presented on Monday, at Marlborough House, the Society's Albert medal to Sir Charles Augustus Hartley, "in recognition of his services, extending over forty years, as engineer to the International Commission of the Danube, which have resulted in the opening up of the navigation of that river to the ships of all nations."

The Total Cost of the legal proceedings relating to the ownership of the Irish gold ornaments was 3,114*l.* cs. 2*d.* The fees of the law officers were 595*l.* 5*s.* The amount paid by the British Museum for the ornaments was 600*l.* The Treasury paid the taxed costs of the British Museum, the defendants in the action, amounting to 1,486*l.* 12*s.* 2*d.* The ornaments were on Monday deposited in the Dublin National Museum.

The Playing Cardmakers' Company have issued their awards in the competition for the best designs for the backs of playing cards. First prize (the H. D. Phillips prize), Mr. F. D. Welenn, 15 Avenue Road, N.W.; second prize, Mr. G. D. Woodfield, 33 Huddleston Road, Tufnell Park; third prize, Mr. W. S. Riley, 98 St. Saviour's Road, Leicester; and fourth prize, Mr. E. Phillips, Princes Rock, Plymouth.

The Metropolitan Park Commission of Boston propose to construct a path around the highest hills as a memorial of Charles Eliot, the late American landscape architect. Against a rock forming one abutment of the parapet of a runic stone arch bridge is to be placed a bronze tablet "dedicating to the memory of Charles Eliot the bridge, the path and the landscape itself—a monument of a grandeur unapproachable by any human construction."

Sir Samuel Montagu has offered to the London County Council a sum of 10,000*l.* for housing purposes, and it is proposed to allocate the gift to a portion, about 25 acres, of the White Hart Lane Estate, Wood Green, and on which cottages for the working classes will be erected.

The Metropolitan Asylums Board will apply to the Local Government Board for an order authorising the managers to incur an expenditure not exceeding 8,680*l.* on the erection of the proposed additional buildings at Joyce Green Hospital, such expenditure to be defrayed by means of a loan repayable within a period of thirty years.

The Dean Farrar memorial committee have resolved that, in the event of the necessary funds being obtained, the memorial to the late Dean of Canterbury should take the form of carrying into effect his design for filling the west window of the chapter-house of the cathedral with coloured glass to match the east window, and of completing certain details in the restoration of the chapter-house.

The Court of Common Council have agreed to support the suggestion made by the further Strand, improvement committee in a memorial to the London County Council that the buildings in Aldwych should not be extended into what should be the roadway of the Strand.

The Parish Church of Bosham, in Sussex, which contains Roman as well as Saxon masonry, is to be restored under the direction of Messrs. Colson, Farrow & Nisbett, architects, of Winchester and London. It is twice mentioned in the Domesday Survey, and in the Bayeux tapestry Harold is represented as entering it in order to perform his devotions before sailing for Normandy.

The London County Council are about to expend 39,550*l.* upon the erection of 146 cottages on the Norbury estate and 40,100*l.* in connection with the formation of roads and sewers on the same estate, besides 120,317*l.* on the erection of 414 cottages on the Totterdown Fields estate, Tooting.

Three Hundred Diplomas of the Paris International Exhibition which have not reached their destination have been returned to the commissioner, M. Picart. Some of the winners are dead, others have given wrong addresses, while a third class considered it was not worth while to leave any address.

The Victoria and Albert Museum has acquired for 550 guineas the seventeenth-century woodwork and carving, ascribed to Grinling Gibbons, at 3 Clifford's Inn, 21 feet long and 10 feet high, with bolection moulding, designed chair rail, deep skirting and four doorways, and great chimneypiece surrounded by extremely rich carving of the date of Sir Christopher Wren.

Mr. Thos. Hellyar Foord, of Rochester, has subscribed 5,000*l.* to Dean Hole, to be applied to the restoration of Rochester Cathedral.

The Italian Minister of Public Works has invited tenders for the building of an aqueduct to provide the Apulian plains in the "heel" of Italy with water from the Apennines. The total length of all the ducts will be 1,071 miles.

M. Edmond Haraucourt, director of the museum of comparative sculpture at the Trocadéro, Paris, has been appointed director of the Cluny Museum in the place of M. Enlart, who has retired.

Mr. Cavendish, as representing the First Commissioner of Works, has informed Sir H. Maxwell that not a particle of the stonework of the river front of Somerset House has been painted, therefore the question of the effect of white lead paint on Portland stone does not arise. The pediment and enrichments, together with the lower part of the dome, are of stucco and wood (almost entirely the latter). This work has probably been painted during the whole time of its existence. The vases are of a clay composition, and have also always been painted, as is evidenced by the fact that the old coats of paint are from $\frac{1}{4}$ -inch to $\frac{3}{4}$ -inch thick.

Mr. E. W. Richards has been appointed principal of the London County Council Brixton Technical Institute. The Institute, which will be opened next session, is situated in the Ferndale Road, Brixton, and is intended to be an important centre for instruction in building trades. Mr. Richards has had experience both in practical building work and in teaching building trade subjects. He has been engaged in teaching in the evening classes at polytechnics and technical institutes, and for the past seven years he has held the position of head of the building trades department at the Northern Polytechnic, Holloway.

St. Andrews' University will appoint on September 19 a lecturer in geology at a salary of 300*l.* per annum, the lecturer to conduct courses qualifying for graduation in arts and science.

An Historical and Archaeological congress, organised by the Archaeological Society of the province of Namur, will be held at Dinant, Belgium, from August 9 to 13. The federated historical and archaeological societies of Belgium, under the patronage of His Majesty the King of the Belgians, will take part in the congress. Among the subjects for discussion will be primitive settlements in Belgium, the history and traces of Roman occupation, the Frankish invasions and the progress of the arts. An exhibition of choice pieces of the chased copper and bronze wares formerly made in Dinant has been organised in connection with the gathering.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BLACKPOOL—Aug. 31.—Competitive drawings are invited for new offices to be erected at the corner of Sefton Street and Nixon Street, Blackpool. The architect whose design is selected will be appointed to carry out the work. The competition is limited to architects having offices and practising within the water area of the Fylde Water Board. Mr. C. Arthur, 34 Victoria Street, Blackpool.

HOWDEN—Sept. 12.—Plans and estimates are invited for improving and extending the sewerage of the contributory place of Howden. The successful competitor will be awarded a sum of 15% and the usual commission for superintending the execution of the works. Mr. Henry Green, clerk.

HUNSLET—Aug. 5.—Designs and estimates are invited for ornamental gates, and for fencing of lift wells at the new workhouse, Rothwell Haigh. Mr. Fred W. Mee, clerk, Union Offices, Hunslet, Leeds.

LONDON—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75% design placed first, and one of 25% for second. Mr. Edward Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100%, 50% and 30% respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

WOODHOUSE.—For the erection of club premises at Woodhouse. Messrs. Buttery & Birds, architects, 1 Basinghall Square, Leeds.

ON the 25th inst. a large party of members of the Lancashire and Cheshire Antiquarian Society made an excursion to Warrington for the purpose of examining the foundations of a house recently uncovered on the site of the Roman civitas at Stockton Heath, which is being explored at the expense of the museum committee of the Warrington Corporation, under the direction of Mr. Thomas May, one of the local members of the Society, who acted as leader on the occasion. A silver denarius of Nero found on the site by Mr. May serves to fix the date of the remains. The party then proceeded to examine the potters' kilns, and also visited the Warrington parish church, Grappenhall Church and Warrington Museum, where a large number of objects obtained from the excavations have recently been deposited.

VARIETIES.

IN our report of the comprehensive exhibit of Messrs. George Freeman, Ltd., at the Sanitary Institute Exhibition, which appeared in our issue of July 17, we referred to the beautiful examples of tiles and tilework shown on their stand that were so generally admired. These should have been described as the "Flaxman" art tiles, manufactured by Messrs. Wade & Co., for whom Messrs. Freeman are agents.

THE Bexhill Town Council have resolved to organise a competition for the erection of a memorial clock tower, the total cost not to exceed 200*l.*, including architect's fees.

FOUNDATION-STONES of new fire-stations in the Old Kent Road and at Evelyn Street, Deptford, have been laid by the chairman of the fire brigade committee of the London County Council.

PRINCESS HENRY OF BATTENBERG went on Tuesday to Scarborough to open the new town hall in Castle Road, which has been erected to the designs and under the supervision of the borough engineer, Mr. Harry W. Smith.

PRINCESS LOUISE, Duchess of Argyll, has consented to open a block of artisans' dwellings erected by the Liverpool Corporation on a site from which insanitary property was cleared. This is part of a scheme of rehousing which will involve an expenditure of nearly a million sterling.

THE Geological Museum will be closed during the repainting of the interior from August 1. The business of the

Geological Survey will be carried on as usual and all visitors coming to the Museum for special information may obtain admission.

WE are pleased to see that a much-needed improvement is being made in Theobald's Road, where the unsightly wall which for so many years has shut off the green and shady pleasance of Gray's Inn is now in course of demolition, and a low wall surmounted by ornamental railings is to take its place.

THE Prince of Wales Pier, Dover, constructed at a cost of 500,000*l.*, was utilised for the first time by the Hamburg-American Line on Sunday last. The steamer *Prinz Sigismund*, outward bound from Hamburg, occupied only a few minutes in taking up her position alongside the pier and landed her passengers most expeditiously.

THE proprietors of the *Engineering Times* are about to issue a special colonial export number for circulation amongst buyers and users of machinery in our colonies. This number will describe machinery and engineering specialties particularly suited to colonial requirements, and will provide a good opportunity for engineering firms in the United Kingdom to bring their productions under the notice of steam and machinery users in India, South Africa, Australasia, Canada, &c.

ON Saturday afternoon members of the Hampstead Antiquarian Society were conducted over Lincoln's Inn by Mr. W. Paley Baildon, and after visiting the great hall, library, chapel and other points of interest, they assembled in the old hall, where Mr. Baildon gave a lecture on the history of the Inn. The Society of Lincoln's Inn was first heard of in 1422, when they rented the Bishop of Chichester's town house, in what is now Chancery Lane, for 6*l.* 13*s.* 4*d.* a year.

A SPECIAL meeting of Perth Town Council has been held for the purpose of signing a deed of agreement as between Sir Robert Pullar, of Tayside, and the Lord Provost, magistrates and Town Council of Perth, by which Sir Robert Pullar undertakes to present a sum of 8,500*l.* to the Town Council to meet the cost of the erection and equipment of a new set of public washhouses, provided that if the cost should exceed this sum it would be met by the Council. The sum gifted by Sir Robert considerably exceeds the estimates for which tenders have been received.

AT an adjourned meeting of the preventive medicine and vital statistics section of the Royal Institute of Public Health, Liverpool Congress, 1903, held on Tuesday, July 21, it was

proposed by Dr. Vacher, county medical officer of health for Cheshire, seconded by Dr. H. Scurfield, medical officer of health for Sunderland, and unanimously resolved:—"That this 1903 congress of the Royal Institute of Public Health held at Liverpool approves of the efforts made by the Worshipful Company of Plumbers in promoting the Plumbing Registration Bill, believing that such a measure will be for the safeguarding of the public health, and beneficial to all classes of the community, and appeals to the Government to give facilities and support to the measure."

THE Wilts Archaeological Society met last week at Stonehenge, when the Rev. E. H. Goddard gave an interesting account of the raising of the leaning stone. Professor Story Maskelyne, in thanking Sir Edmund Antrobus for the kind invitation to visit Stonehenge, said that by raising the leaning stone, the biggest stone of its kind in England, Sir Edmund had carried out one of the most important pieces of archaeological work he had known. People might quarrel about the barbed wire fence and the rights of way, but in his opinion the greatest public right in Stonehenge was the preservation of the monument, and that the present owner was doing to the best of his abilities.

THE new headquarters of the 1st Lancashire Royal Engineers (Volunteers), in Mason Street, Edgehill, Liverpool, were opened on Saturday afternoon. They include a drill-shed 150 feet by 70 feet, and an outside parade ground 60 yards by 60 yards for engineering work and drill. A commodious room is set apart for the use of the officers, and immediately above it, and of the same dimensions, is one for the sergeants. There are also senior and junior officers' dressing-rooms, a clothing store, general stores, an armoury, a fine modelling shed and an excellent recreation-room for the men, so that the corps is now well equipped for carrying on the important work attaching to its particular branch of the service. The cost amounts to 6,000*l.*

THE Bishop of the diocese reopened on Wednesday the parish church of Lower Guiting, near Cheltenham, and dedicated the restoration work which has been recently carried out and a combined vestry and organ-chamber which has been added to the sacred building. The church had been allowed for many years past to fall into a very dilapidated condition. Since the advent of the Rev. G. B. Sharpe as curate-in-charge the work of renovation has been taken up earnestly, and the completion of the restoration has involved an out-

Buildings, Ludgate Circus, London.

lay of about 2,600*l*. The whole of the chancel, with the exception of the priests' doorway, has been taken down and rebuilt, and the nave and transepts have received new roofs and been otherwise renovated, while a vestry and organ-chamber have been built over the heating-chamber. The Bishop warmly congratulated the curate-in-charge and the parishioners on the good work done, and expressed confidence that the debt of 700*l* odd on the renovation fund would be speedily wiped off.

THE Infirmary at Brunswick Square, Camberwell, which has been undergoing renovation and extensions for two or three years, has just been opened, in its modernised and enlarged form, by the Board of Guardians for St. Giles, Camberwell, in which parish the buildings are situated. The buildings now present towards the wooded square an extensive and handsome frontage. They occupy several acres of ground, are arranged on the "scattered home" system, which the St. Giles Board claim to have introduced for the first time into the Metropolis, and are all connected by glass-covered ways and subways. The accommodation has been increased from about 330 to 800 beds, and includes a separate block for children, who, in the absence of separate provision for them, have hitherto been treated with the old people, but can now be accommodated separately to the number of about eighty. There are some twenty wards which can be used for isolation cases, and special wards for cases of consumption, arranged as nearly as possible on "the open door" system, with flat roofs for airing courts. All the modern electrical appliances have been introduced for medical treatment, among other improvements being the electric bath, electric lifts and labour-saving devices of various kinds. The contract price for the new buildings amounts to close on 170,000*l*, which the modernisation of the old structures brings up to nearly 200,000*l*. The architect is Mr. E. T. Hall, the contractors being Messrs. Holliday & Greenwood.

THE illuminations at Belfast in honour of the royal visit were on an extensive scale, in many respects surpassing those provided for Dublin. Messrs Robinson & Cleaver's huge premises were decorated throughout by Messrs. Defries in a novel and effective manner. Along the whole of the frontage in Donegal Place were fixed just above the fascia double festoons of amber-coloured lamps surmounted with green shamrock. Flaming cut-crystal stars 6 feet in diameter, with St. Patrick's Cross in the centre, were fixed at intervals. A fine piece of crystal work was fixed in the centre of the build-

ing, consisting of a cut-crystal star 30 feet in circumference, arranged to revolve by mechanical means. It contained thousands of crystals, every shade of colour being represented, and when in motion produced a brilliant effect. A massive cut-crystal Imperial crown upon a crimson cushion was fixed above the star, a facsimile of the one used at the Imperial Durbar this year in India. On one side of the crown a cut-crystal shield bore the King's cypher, "E. R. VII," and on the opposite side a similar shield contained the royal quarterings. Each shield was surmounted by a crystal crown. Above the central crown another design in cut-crystal represented crossed Union Jacks. A special service pipe was supplied direct from the main in order to provide sufficient gas for the extensive display. On the Donegal Square side the illuminations were of an electrical character, and consisted of festoons of flowers around the windows, ornamental shields surmounted by crowns and banners of crimson and gold plush emblazoned with English, Irish and Scotch devices. A prominent feature of the design was the greeting, "A Hearty Welcome to your Majesties," in huge white letters on a crimson ground. Festoons of pure Belfast linen enter largely into the scheme of decoration. Messrs Robinson & Cleaver's decorations were claimed to be the finest example of artistic decoration ever executed in Ireland. The County Down Railway terminus was also decorated on an elaborate scale by Messrs. Defries. The Northern Banking Company's premises were lit up, as well as other prominent firms, amongst whom were Messrs. J. Arnott & Co in the High Street, the Scotch House, the Ulster Club, Messrs. Anderson & Macauley, Donegal Place, Messrs. Thomson Bros., Messrs Riddels, Ltd, the Royal Hotel, Wellington Place, Kingscourt, Wellington Place, Messrs. Haig, &c.

A GREAT amount of skill and ingenuity, intelligently and scientifically applied, has been exercised in devising systems that shall render buildings fireproof or, at any rate, fire-resisting, and it is now possible so to erect them that the danger of fire is practically reduced to a minimum. A problem closely allied to this question, and one of equal importance, is how to effect the escape of persons from a burning building and enable them to be taken to a place of safety before the fire has time to secure a dangerous hold, which generally has occurred before the fire escape can be brought from its station and placed in position. Probably no means will be absolutely certain to effect this, while it remains a part of our complex

human nature that on a sudden emergency, and when most wanted, presence of mind is generally absent. An apparatus, however, that is always at hand, whether wanted or not, is without complications, quick in action, and that can be manipulated by any ordinary person, is as near solving the problem as we can hope to get.

Messrs. Waddington & Co., who are exhibiting their "Monarch" fire escape at the Fire Exhibition, Earl's Court, may be congratulated on its simplicity and effectiveness. It consists of a steel tube of 2½ inches to 3 inches in diameter and about 7 feet in length, in the head of which twin-pulley blocks are fixed. Over one a lifeline runs, going down through the tube, carried round two others, and returning through the tube to the second one at the head, and forms a double lifeline which can be of any length according to the height of the building. All that is necessary to fix the escape after the window is opened is to put the head through it and place the spur at the base into a hole in the floor, 1 inch square, that is made at the same time the escape is delivered. When in position a simple but reliable check that is fitted outside the tube and controls the lifeline is level with the window, and is to hold the line fixed while a person who has already slipped into a rope-sling which is attached by a safety hook is being taken through the window, as well as to control them if necessary while descending. At the crown of the tube is attached a guide rope held by passers-by or attached to any object on the road, which enables the person rescued to be carried past any projection of the building or clear of the flames issuing from a floor below, although every one could be rescued before the fire obtained such a hold. As soon as the ground is reached another hook on the lifeline is ready to receive the second person being brought into position by the descent of the other half of the line. The last person in the building is able to descend equally well, as he has perfect control over the line, while persons can be rescued from any floor below the escape. Ambulance slings are provided by means of which invalids can be lowered in a reclining position and carried to a place of safety. Although these escapes are suitable for all kinds of buildings and of any height, they are of special service for use where windows overlook narrow passages or alleys where the ordinary escape could not be taken. That they are a speedy means of rescue was demonstrated at Wellington Mills, Stockport, in December last, when sixty-five persons were sent down from seven storeys high in fifteen minutes.

TRADE NOTES.

THE new Lancashire inebriates' home, Langho, near Preston, has had a four-dialled illuminated striking clock and bell fixed in the tower by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds, from Lord Grimthorpe's plans.

THE work of redecoration of Union Street Baptist church, Maidstone, has been completed, and the old place looks as well as ever. The interior work was entirely done with Hall's sanitary washable distemper within a period of one week. The short time taken to complete the job has caused some local comment. The decorators were Messrs. Spiers & Perott.

A NEW and handy system of document filing is being introduced by the Globe Wernicke Company, Ltd., formerly Thomas Turner (Leicester), Ltd. The advantages, which are sufficiently obvious, of this system may be summed up in a few words—efficiency, economy of space, portability and cheapness. The Globe Wernicke elastic cabinet is made in nests of a few compartments, and the user can provide himself with as few or as many of these nests as his needs demand, and these can stand on his desk, fill a recess, or form a screen or even partition according to his requirements, and in either of these positions present a neat and orderly appearance.

BUILDING AND BUILDERS.

THE memorial-stones have been laid of a Welsh Calvinistic Methodist chapel for Altrincham.

THE foundation-stones of the Hazel Grove Reform Club, Manchester, were laid on July 25. The new club will be erected in brick and Portland stone, and will provide a good clubhouse for the Liberals of the district, whose present accommodation is wholly inadequate. The total cost is estimated at about 1,500/.

THE foundation-stone of St. Brigid's Church, Aran Island, was laid by His Grace the Most Rev. Dr. Healy, Roman Catholic Archbishop of Tuam. The church is being erected to the designs of an Irish architect, the contract has been entrusted to a Galway man, and one of the conditions of the contract is that everything used in the erection of the building must be of Irish material.

A LOCAL Government Board inquiry was conducted at Leeds town hall by Mr. W. O. E. Meade-King concerning an application by the Leeds Corporation for sanction to borrow

TELEGRAMS,

"Trowelled, Lon-Don."

400,000*l.* for the purposes of street improvements, and 100,000*l.* for waterworks purposes. The first sum is in connection with the purchase of properties for improving from 175 to 200 public streets in the city, and the latter for ordinary extensions of the waterworks, a few new mains, &c. There was no opposition.

EUSTON HALL, Suffolk, the seat of His Grace the Duke of Grafton, K.G., which was almost entirely destroyed by fire in the spring of last year, is being rebuilt. Externally the general lines and character of the old building are to be maintained, but internally the arrangements have been remodelled to meet present-day requirements. The works are being carried out by Mr. Thomas Heath, of London and Towcester, under the directions of Mr. W. H. Atkin Berry, F.R.I.B.A., of the firm of Kidner & Berry, London.

THE foundation-stone of a new permanent church in Eardley Road, in connection with the parish of St. Mary's, Kippington, was laid on the 22nd inst. For some twenty odd years an iron church in the Granville Road has served the purpose of an auxiliary building to St. Mary's, but for some time this has shown signs of decay, and as it had also become inadequate to the demands upon it, efforts have been made to provide the necessary funds for erecting a permanent church. Plans were prepared by Mr. J. T. Lee, and an estimate sent in by Messrs. Cornish & Gaymer, of Norwich, for 2,900*l.*, has been accepted; the work at present to include chancel, transepts, vestries and a temporary nave.

ELECTRIC NOTES.

THE foundation-stone was laid on the 20th inst. of the new electric light station which is being erected on the western shore, Southampton, on land which has been reclaimed from the sea. The foundations have been completed, and the work in connection with the superstructure is also well forward.

THE New Zealand Government intends to make use of a powerful waterfall called the Huka Falls, in North Island, for the purpose of obtaining electricity. A Swiss engineer named Alloa, of Berne, has been engaged by the Colonial Government to construct an electric station on the falls, and has already left this country for New Zealand. It is estimated that the electric force which will be obtained will be sufficient to light the principal centres in the North Island and to supply power for the tramway systems.

MEASURES BROTHERS, LTD.

MESSRS. MEASURES BROTHERS have been intimately connected with the metal trade, especially in its most important products, since the introduction of the rolled beam as an auxiliary in building construction. They have gained so wide a reputation from their success in carrying out large contracts as well as ordinary business, their names are potent among architects, engineers and builders. The conversion of the firm into a limited liability company was therefore an event in the financial world. It was not to be expected that the interests of a younger generation were to be sacrificed by the arrangement. That would be contrary to justice. A new firm was accordingly established, with the title of Messrs. H. & G. Measures, and the partners having knowledge and energy besides bearing a name which was influential, attained the success that was to be expected. The competition was carried on in an equitable spirit. The shareholders, however, realised the situation, and at a meeting held in February a committee consisting of Mr. Walker, Mr. Bedford and Mr. Redman was appointed to confer with Messrs. H. & G. Measures and Messrs. Measures Brothers in order to endeavour if possible to purchase the business of Messrs. H. & G. Measures, of Croydon, or to amalgamate on such terms as would be likely to work best in the interests of Messrs. Measures Brothers.

After negotiations terms were arranged which were approved by a large majority of the shareholders at meetings held on June 26 and July 13. The result is that Messrs. Measures Brothers, Ltd, have amalgamated with Messrs. H. & G. Measures. The rivalry is not only ended, but the company gains additional strength, as Mr. Harold Albert Frederick Measures and Mr. Gilbert Emile Arthur Measures become directors of the Company. In its new and developed form there will be increased power, and it may be said without exaggeration the firm of Messrs. Measures Brothers, Ltd, will be equal to deal with the most difficult and most extensive contracts in which iron and steel are elements.

STANDARDISATION OF CAST-IRON PIPES.

THE final report of the committee on the standardisation of cast-iron pipes has been presented to the Association of Waterworks Engineers. It is signed by Messrs. Frederick

Griffith, president; William Watts, past-president; H. W. Pearson, M.Inst.C.E., Baldwin Latham, M.Inst.C.E., E. Brough Taylor, M.Inst.C.E., and Reginald E. Middleton, M.Inst.C.E. The interim report showed that the general feeling of waterworks engineers and pipefounders was favourable to the standardisation of cast-iron pipes, subject only to some difference of opinion as to the limits within which standardisation should be confined. The manufacturers were said to be unanimous in desiring to carry out any standardisations decided upon, and to stock such patterns as might be approved. The recommendations were that standards should be based upon the external diameter rather than the internal; to limit the number of sizes standardised to those in common use in this country; as regards coating, that greater uniformity should be observed in the mixing of the composition and in the method of dipping the pipes; as to the form of joint, special attention should be paid to the design of sockets for lead joints without yarn of any description, as well as to turned and bored joints; that the number of patterns standardised should be kept as low as reasonably possible, and that the standard length for all diameters be adopted; that the quality of the metal should be standardised, but that it is undesirable to include waterworks fittings or anything but cast-iron pipes and specials in common use. The committee do not consider that the metric system of measurements can be conveniently adopted at the present time. They intimated that the next step to be taken is to refer the whole matter, including the recommendations herein contained, to the engineering standards committee, on which the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Institute of Naval Architects and the Institute of Electrical Engineers are already represented. They received a very cordial invitation to this effect from Mr. Charles Hawksley, past-president of the Institution of Civil Engineers, who also suggested that the committee would, no doubt, be pleased to invite the Association to appoint delegates as members of the sub-committee which would be detailed to consider this subject. Under these circumstances it was recommended that the invitation be cordially accepted, and that the two reports be forwarded to the secretary of the standards committee with a request for the early consideration of the whole matter, and an undertaking to render the committee every assistance which they may invite. The report was adopted unanimously.

ELECTRIC LIGHTING IN MARYLEBONE.

A SHORT time ago the London County Council, upon the recommendation of its finance committee, resolved not to grant the application of the St. Marylebone Borough Council for sanction to the borrowing of 1,274,000*l.* for the purchase of that portion of the undertaking of the Metropolitan Electric Supply Company, Ltd., which is within the borough, under the award of the arbitration. The ground for the refusal was that the committee was advised that it could not sanction the proposed loan without further statutory authority being given to the Borough Council authorising it to borrow. Since communicating their decision to the Borough Council a letter has been received from the Parliamentary agents asking whether, if the Borough Council obtains a license from the Board of Trade under the Electric Lighting Act, 1882, to supply electricity within the borough this will remove the legal objection to the Council sanctioning the loan. The solicitor to the County Council has, upon the instructions of the finance committee, obtained the opinion of Mr. Haldane, K.C., M.P., upon this question, and he has advised that if the proposed license is obtained from the Board of Trade the Borough Council will obtain such legal power to borrow as will justify the Council in sanctioning the borrowing. Inasmuch, however, as the maximum period for which the Borough Council can be authorised to supply electricity under such license is seven years, Mr. Haldane advises that the period for the repayment of the loan should be limited in the first instance to the period of the license. After the Borough Council has completed the purchase of the undertaking and the Board of Trade have fixed the date of the commencement of the St. Marylebone Electric Lighting Order, 1901, the Council will be in a position to vary its order sanctioning the borrowing by extending the period for repayment of the loan thereby authorised. The finance committee now report that this matter had been attended by many difficulties, and they had heard a deputation of ratepayers urging them not to recommend the sanction of the loan. The acquisition of the undertaking, however, had been rendered compulsory by Act of Parliament, and the purchase price had been determined by arbitration. In these circumstances it appeared to them that Parliament had taken upon itself the responsibility for the proposal, and the Council was hardly in a position to exercise the discretion reserved to it in ordinary cases. The committee accordingly recommend that counsel's opinion should be communicated to the Borough Council, pointing out that when they had obtained the Board

of Trade license the Council will be prepared to entertain the application for a loan upon its merits.

A CREMATORIUM FOR BIRMINGHAM.

THE new crematorium at Sheldon Coppice, near Rocky Lane, Birmingham, on the Birmingham and Walsall Road, is rapidly approaching completion, and will be opened, it is expected, in September by Sir Henry Thompson, the president of the Cremation Society. The need of such a building has been felt for a considerable time, as every year has seen an increase in the number of those who favour cremation against the present mode of burial. The chief objection to cremation, on sentimental grounds, which must always be respected, is gradually disappearing. A Birmingham company was formed during the latter part of 1901 to provide a crematorium for the Midlands, and eventually the present site, which is about an acre in extent, was obtained. The crematorium is situated in a delightful country spot some distance from any dwelling-house, and is sheltered by a number of fine trees and surrounded by a wealth of vegetation. It seems an ideal spot for such a building.

Architectural beauty is not lost sight of in the crematorium. Mr. Frank B. Osborn, the architect, has examined the construction of the Woking Crematorium (which is, perhaps, the best known in England), and other similar buildings. The building is, therefore, of a complete and thoroughly up-to-date character. The chapel and crematorium stand in the centre of the land, and are approached through an entrance gateway and drive from the main road, at which there is an ornamental lodge. At the entrance to the chapel there is a large porch or vestibule. The size of the chapel itself is 50 feet long by 25 feet wide, and about 40 feet high to the ridge, with an open-timbered roof, the total length of the building being about 107 feet. On one side there is a vestry and registry office with a separate entrance, and on the other side a small mortuary chamber. The chapel is principally lighted by lofty clerestory windows, and underneath these on both sides are artistic recesses for the reception of urns containing the ashes of the dead. If relatives prefer, these urns may be placed in cloisters of ornamental design, which they will be at liberty to erect in the grounds. The chapel, which is of an ecclesiastical character, in brick and red stone with tiled roof, will be provided with chairs and furnished with a reading-desk and harmonium. The

catafalque, suitably draped, will be against the end wall opposite the entrance, and is to stand on a stone platform approached by two steps. It may, if desired, be decorated with flowers. Immediately behind the catafalque, and concealed by curtains, is an iron door leading to an intermediary chamber. On the north-west side is a lofty ornamental tower, 80 feet in height, containing the stack.

The interior of the cremating chamber is at no time visible to mourners. The coffin, when brought into the chapel, is placed upon a catafalque. When the committal sentence in the religious service is reached the coffin passes noiselessly, by means of an invisible mechanical arrangement, into the intermediary chamber, and finally into the incinerating chamber, but not till the mourners have left the chapel. The incinerating chamber is filled with gas of an intensely oxidising character in a state of incandescence. The firebrick walls are heated to an orange-red glow by a coke fire placed far below it. There are no flames, no smoke, only a lurid, unchanging glow. The temperature attained is about 2,000 deg. Fahr.—the melting point of silver. The process occupies about an hour; pure white ashes are all that remain, and they are removed through a small door at the side, where an urn is placed to receive them. These incinerary urns or vases are made in earthenware, white and coloured marble, bronze or copper, and many of them are of a graceful and artistic design, and bear inscriptions to the memory of the departed. In some instances the remains are taken home, but this does not often occur.

The movement in favour of cremation began in 1874, and had many obstacles to contend with—not only public prejudice, but ecclesiastical and Governmental obstacles. Throughout the country these are gradually disappearing, and to many the advantages of cremation over earth burial have become apparent. In 1900 the cremations numbered over 300, and there seems little doubt that each succeeding year will show a steady increase in the number. This progress is largely the result of the exertions of men like Sir Henry Thompson, who has been described as the father of the cremation movement in this country, and several prominent members of the medical profession. Dr. Alfred Hill, the retiring medical officer for Birmingham, last year contributed an important paper on the subject, in which he strongly favoured cremation, both on sanitary and economic grounds. Already crematoria have been erected at Manchester, Glasgow, Hull, Liverpool and Leicester, and other places are now following London's lead.

The Architect.

THE WEEK.

THE prejudice against restoration has been recently exhibited at Malpas, in Cheshire. The parish church is in the hands of Mr. C. HODGSON FOWLER, of Durham, whose experience in work of the kind is well known. He may be considered as one of the "conservative restorers," and has not shown any partiality for innovations. Now, Malpas Church, which is an excellent example of Gothic, at one time presented pinnacles which were a necessity of the style. But, as often happens, such features are particularly subject to atmospheric influence, and only the remains of them are now visible. Mr. FOWLER in his scheme included their addition, and as an experiment he had one set up in order to be satisfied about the proportions. The contrast between the old stonework and the bright sandstone addition was necessarily marked, but it hardly warranted the outcry raised against the innovation. It was supposed that the church was perfect in its plainness, and that the effect which had delighted living parishioners, if not their predecessors, was doomed to be destroyed. The architect accepted the situation philosophically. He said that the church would look richer with them, but as all had gone, he did not think to make a strong point of the desirability of replacing them on the naves and aisles. The chancel needed them to take off the bare look, for instead of being richer than the nave it was poorer. As the pinnacles were thus required on the south-east and north-east angles, they ought to have them on the sides. Without them the porch looked unfinished. If they did not decide to have them on the nave and aisles they would have restored, or rather repaired, all the old stonework, and not have introduced any work of mere imagination, which pinnacles must be. One of the churchwardens declared that the pinnacles would be very obtrusive, they could not be otherwise; and they would not become time-worn for years and years. Their newness would appear so obvious that this would form a chief objection. He was satisfied with the old church as it was, and he thought it was best to leave well alone. Although much was brought forward against the proposal, when it came to the voting there was no opposition to a resolution which stated that the restoration should be left in the hands of the Rector and Mr. HODGSON FOWLER, and that the church should be brought as near as possible to its original state. It is generally supposed that restoration is a fraud, because people cannot at first glance discriminate between old work and new. At Malpas there could be no charge of that kind, for the new masonry and carving was thought to be too obtrusive. But any cause will serve when an attack in such cases has to be made, although it might be supposed that a rector and his architect are as much likely to have interest in the church as any layman in the parish.

WE cannot understand why architects should be treated as if they were officers of a law court, and were bound to be present whenever any proceedings are taken against them, or at least that they should be represented by counsel. The financial interest which an architect may have in any lawsuit may be so insignificant that attendance is likely to cause a loss to him which he cannot afford. The rigorous requirements of the courts have been exemplified in the action *SANDERSON v. The Blyth Theatre Company and HOPE*, which was heard a few days ago in the Court of Appeal. The plaintiff sought to recover 189*l.* 11*s.* 6*d.* from the company for work and materials which were ordered by Messrs. HOPE & MAXWELL, the architects. The company denied the order. The plaintiff was then allowed to make Mr. HOPE one of the defendants. Then the company alleged that Mr. HOPE had no authority to employ the plaintiff. Mr. HOPE also denied that he was the agent of the company. The jury found verdict for the plaintiff against the company. The judge who heard the case decided that Mr. HOPE should recover his costs from the plaintiff, but that those costs as well as the plaintiff's should be paid by the company. The company, however, obtained leave to appeal from the part

of the judgment by which they were directed to pay costs incurred by plaintiff, making Mr. HOPE a defendant, and the costs to be paid to him. Mr. HOPE was, no doubt, advised to take no part in the appeal. This conduct did not find favour with the Court. The appeal was dismissed. The occasion was taken to make some strong remarks not so much on what Mr. HOPE did as on what he avoided doing. Lord Justice ROMER said:—"I do not think that I myself should have given to the defendant HOPE, having regard to his defences and conduct, any costs whatever, either as against the plaintiff or co-defendant. But I do not think it is open to the appellant on this appeal to go into the question whether the defendant HOPE should have been paid his costs, for the following reasons:—No doubt at the trial the plaintiff did not question HOPE's right to costs. But the question as to costs was adjourned. At the adjournment HOPE was not present, but the appellant company was present. If the company had taken the point that HOPE ought not to have had his costs, HOPE could have been brought before the Court again and the matter been fully argued and decided. But the company did not raise the point, and I think the company and the plaintiff must be taken to have agreed that there was no 'good cause' shown for depriving HOPE of costs. The only point argued by the company was that the Court had no jurisdiction to add HOPE's costs to the plaintiff's, and in that way order the company to pay them, and I think it is too late now for the company to argue that the defendant HOPE never ought to have had his costs provided for as they have been. I think, moreover, that the leave to appeal was given on the question of jurisdiction only, and this view is borne out by the notice of appeal and by the fact that the defendant HOPE is not before this Court. And, lastly, with regard to the suggestion that the costs of HOPE have been made to include costs of the issues on which he failed, I need only say that the taxation of those costs was in the presence of the company, and that it is too late now to question the amount taxed." As Mr. HOPE did not suffer, and the appeal was dismissed, there must have been sufficient reasons to justify his absence. But the case should be taken as a warning by architects, for it is better to submit to the loss of a day or two in Court rather than appear indifferent to what is being transacted there.

ONE of the most beautiful drawings in the Louvre is a study of the bust of a young woman by WATTEAU. A coloured etching of it by M. PENNEQUIN appears in *L'Art*, and is a masterpiece of reproduction. The pictorial effect of the original is gained simply by means of a red crayon with a few touches of black. All depends on the vigour and yet delicacy of the strokes. The copy is no less effective, and may be taken as one of the few cases which justify the revival of an extinct art. The same number is attractive by the articles on this year's Salon, some letters by Madame TALMA, the wife of the tragedian, an account of the French explorations at Antinoë, an article on HECTOR BERLIOZ, with fine illustrations, and one on JOSEPH DROZ, the historian. The illustrations are evidence of unceasing efforts towards the attainment of perfection.

As long as the so-called fine arts are allowed to maintain a monopoly of distinction, it is not to be expected that those engaged in the decorative arts will be contented with their lot. It may be said there is no dividing line between the two, but that is one of those philosophical conclusions which can never be consoling. This was the attitude adopted by M. BARTHOLDI, the sculptor, recently, when distributing the prizes to the students of the Ecole des Beaux-Arts Décoratifs. The difference in ancient and modern systems of teaching art was that formerly antiquity predominated, whilst now the individuality of the artist is allowed the fullest play. M. BARTHOLDI asserted it was a benefit to vulgarise art, and, moreover, it was a patriotic duty, for the supremacy of France had to be upheld in *objets d'art* as well as in things that might appear to be more important. But designers cannot forget that it was only in recent years their works were admitted into the Salon, and that privilege was only conceded when it was found that the rival society made no distinction between fine art and industrial art.

ACADEMY REFORM.

THERE are periodical epidemics of discontent in this country for which there appears to be no remedy. One of the most localised attacks artists, and takes the form of temporary animosity against the Royal Academy. The public in general are indifferent to the sufferers, for to them what is most important is the exhibition of pictures, and whatever may be the errors of the Forty, it must be admitted that a shilling's-worth of entertainment is provided every summer. But as regards artists, they are not satisfied with providing materials for the show. They wish also to obtain remuneration for their labour. If visitors will simply glance at pictures instead of purchasing them, there is disappointment, which is followed by outbreaks, and the Academy is treated as if it were some jealous agent who stands between buyers and vendors. This season is generally considered to have been exceptionally noticeable for the hesitation and penuriousness of dealers, and, as usual, the consequence is a desire for revolution in the government of the Academy. It is not a logical aim, but no other serves so well.

By acting in that manner artists and their friends display a want of originality. They are simply imitating the crowd who advocate the transformation of Government departments whenever any inconvenience is caused by the action of one of the officials. There seems to be a peculiar aptitude in English folk for a demand of the kind. Just as the old lady was frightened almost to death when HORACE WALPOLE remarked that there was a strong smell of thieves in her house, so we are always ready to believe that in every corporate institution there are wrong-doers inimical to all those virtues are superior to theirs. It is well, perhaps, that officials who are liberally paid for raising obstacles to the prosperity of the country should be suspected and watched. But the Royal Academy is not, and never was, a Government department, and we doubt whether much advantage has been gained by considering it as if it corresponded with an ordinary circumlocution office. That it is defective there is no denying, and it could hardly be otherwise. It came into the world under equivocal circumstances, and its whole history shows that it can never emancipate itself entirely from its original weakness. As the history of its foundation is generally overlooked, it may be allowable to briefly refer to it.

Up to the middle of the eighteenth century the arts of this country were without any organisation. Everything was left to individuals. Foreigners came over and often attracted commissions; but, to do them justice, they made no arrangements by which any of their countrymen would gain a footing in this country. With an equal amount of luck it was possible for Englishmen to gain as many advantages. WILLIAM KENT was not a genius nor a foreigner, but having influential friends he was enabled to design public buildings, to look after royal pictures, to paint portraits and ladies' dresses. His successor, one SHACKLETON, probably was as versatile, as incapable and as successful. The patrons were not proficient enough to distinguish between what was good or bad in what was known as art. HOGARTH being without powerful supporters, and being deprived by nature of the fawning tongue and suppliant knee, had the courage to appeal to the British public by his prints. He was no doubt acting in an undignified way by selling works of art as if they were spoons. But he was following his own notions of right and wrong. As became a man of business he wished to secure protection for what he produced, and he agitated in his own way until he obtained a Copyright Act, a novelty by which design was recognised as an asset.

HOGARTH was a tradesman, and, like other men of the same class, he enjoyed his club, which was known as the St. Martin's Lane Academy. He had succeeded by his unaided efforts, and he considered that other men would do well to follow his example. But there were some of his fellow-members of the Academy who concluded it would be an advantage if they imitated, as far as circumstances would allow, the French institutions which were under the patronage of the king. They wished to erect a building, to teach students, and to exercise authority. For those reasons they desired to have more members. On November 13, 1753, at five o'clock in the evening,

it was proposed to hold an election of thirteen painters, three sculptors, one chaser, two engravers and two architects. The effort was not successful. Two years afterwards an attempt was made to create a rival academy for the better cultivation, improvement and encouragement of painting, sculpture, architecture and the arts of design in general. Some of the members of the old St. Martin's Academy, including NEWTON, the secretary, were among the projectors. The required funds were to be obtained by means of an appeal to the public. But owing partly to bad management no money came in. The self-reliant HOGARTH was opposed to the attempt, for he maintained that England was not cultivated enough either to appreciate or to subsidise art. If hereafter, he said, the times alter, the arts, like water, will find their level. He took up art as a development of engraving on plate. But the shopkeeper's spirit was still strong in him, and he considered it was unreasonable for a clever man to sacrifice his interests for the sake of growing famous in art, when, as he said, "his next door neighbour, perhaps a porter brewer, or an haberdasher of small wares can, without any genius, accumulate an enormous fortune in a few years, become a lord mayor or a member of Parliament, and purchase a title for his heir." A remark which was characteristically British.

The co-operation sought after among artists was brought about unexpectedly by an effort of a charitable kind. HOGARTH presented a portrait he painted of Captain CORAM, the founder, to the Foundling Hospital, as well as a design for a decoration which was to be placed over the entrance. Some other artists followed his example, and in return they were elected governors, with authority to hold an annual meeting "in order to consider what further ornaments might be added to the building without expense to the charity." The hospital became attractive on account of its pictures, and, observing the tendency of the public mind, the artists resolved to organise an annual exhibition of their own. The Society of Arts granted the use of their largest room, but on the condition that the exhibition would be gratuitous. Eventually there was a compromise, and 6d. was charged for admission and 6d. for the catalogue. The first exhibition took place in 1760. It was intended to apply the money received for admission in charity. But afterwards it was agreed to utilise it for the advancement of art as soon as by accumulation it had reached the sum of 500*l*. The Society of Arts was dissatisfied with supporting an exhibition which was not gratuitous. In 1761 some of the exhibitors preferred to show their pictures in an auction room at Spring Gardens. There were, however, some members who accepted the proposition of the Society of Arts, and consequently in that year the public were able to enjoy a pair of exhibitions. HOGARTH supported the Spring Gardens experiment, partly because he considered pleasure should be paid for, and because the admission fees were to be distributed in charity. He also prepared two designs for the catalogue, and owing to their interest 13,000 copies were sold.

The difference between the artists led to an important result. In 1764 it was decided to appeal to the king to incorporate the Spring Gardens exhibitors as a society; a royal charter was granted in the next year. One of the first acts of the new society was a resolution that the directors should consider the institution of a public academy. Afterwards it was announced that His Majesty intended to take the arts under his protection, and the resolution was therefore repealed. The models, lamps and furniture in the old Academy of St. Martin's Lane were removed to premises in Pall Mall which had been rented by DALTON, the treasurer, as a printshop. The words "Print Warehouse" were removed and "Royal Academy" was painted in its stead. The change might have been a pantomime trick. Disappointment resulted. It is doubtful whether GEORGE III. had given his sanction to the scheme. The king, who was liberal, certainly did not contribute to the funds, and it was necessary to charge a guinea a year to all the students. There was a possibility that owing to the dissensions which ensued the new Academy must collapse. A schism followed, and one party, of which BENJAMIN WEST was a prominent member, resolved to establish another society. The king heard of the project through the newspapers, and informed WEST of his willing-

ness to patronise any body that would be more likely to lead to an improvement of art. The king's statement was enough to prove that the scheme which had just failed was not justified in appearing as a Royal Academy.

When we remember that in 1759 no society of artists in the ordinary sense of the word existed, and no exhibition, the position of affairs in 1768 was therefore remarkable. There was the Free Society of Artists, a society for the relief of the distressed and decayed brethren, their widows and children, exhibiting in the rooms of the Society of Arts in the Strand. There was the Incorporated Society of Artists of Great Britain in Spring Gardens, and there was the offshoot of the latter, which assumed the title of the Royal Academy. The king endeavoured to be impartial. He told KIRBY, its president, that the Incorporated Society "had His Majesty's protection; that he did not mean to encourage one set of men more than another; that having extended his favour to the Society by royal charter, he had also encouraged the new petitioners; that His Majesty's intention was to patronise the arts; that the Society might rest assured his royal favour should be equally extended to both, and that he should visit the exhibitions as usual." The seceders from the Incorporated Society were more diplomatic than KIRBY and his brother directors. The consequence was that the belief was made to grow that His Majesty's favour was monopolised by the latest of the societies. The conduct of REYNOLDS suggests the mysterious operations undertaken. He had nothing to gain from membership of any of the societies, but he was persuaded to join the Incorporated. On account of the dissensions he declined to act as a director, and he made a promise of standing aloof from all the societies. Sir ROBERT STRANGE, the engraver, said that REYNOLDS was tempted to change his resolution by the possibility of obtaining a knighthood. But as REYNOLDS gave no explanation of his conduct, we may allow him the benefit of the doubt and give him the credit of being inspired mainly by a desire to see artists on a better footing than was possible in the existing societies.

It is no less difficult to determine what was the true cause of the schism. According to FARINGTON, there were too many artists, for there were 141 in the Incorporated Society, and among them, it is alleged, were some whose greatest efforts were "the loaf and cheese that could provoke hunger, the cat and canary bird, and the dead mackerel on a deal board," or, in other words, their productions resembled those we now see chalked on pavements. At such a period it could not be said that the promoters of the Academy were illiberal when they admitted forty Academicians, twenty Associates and six engravers. In fact, it cannot be denied that among the early members were men and women who would not now be regarded as artists. But what was liberal in 1768 must be considered as very restricted in our time. The numbers of painters, sculptors and architects have been increased to a remarkable extent. But the Academy has not been proportionately expanded, or rather it would be more correct to say it has been narrowed, for where are the representatives of the six original engravers? The history of the Academy shows that originally it was no more than a society somewhat limited in its membership; but if it had to be constituted under such circumstances as prevail in our time, there is reason to assume that the number of the members would have been largely increased. If we may judge of the king's intentions by his words, we may say that the Academy would have resembled the present Society of French Artists, and the distinction of R.A. or A.R.A. would correspond with the "Sre" to be found in French catalogues, and which simply means established membership of that particular society.

The writer of an article in the *Quarterly Review* says that the old idea of a semi-private, semi-public body, limited in numbers, self-elected, yet claiming to be representative, must for good and all go. Such a body is, in the nature of it, out of joint with the times. To this we would add that it is not in character with the original constitution of the Academy as a society. If the members were to be the peers of art we may be sure GEORGE III. would have held the appointment of them in his own hands, and his successors would have rigidly preserved the privilege. All that the Academy professed to be was no more than an amended

Incorporated Society, and the original right of selection of membership was granted to it.

We do not allow for a moment that the Academy has failed in its duty. The members are, after all, only human, and after nearly 140 years it is creditable to them as artists and as Englishmen that only one instance has arisen in which it was necessary to expel a member for conduct which was dishonest. JAMES BARRY's case of course does not count. There has been no irregular appropriation of funds by Academicians. There have been no appeals for aid from outsiders, and financial affairs have been conducted in a business-like and straightforward manner. But all this does not get over the fact that the Academy has not been for many years as representative of British art as it was intended to be, and as it was at the outset. By allowing the greater part of the space on the walls to painters, and by having a majority of painters among the Academicians, art in England has become identified with painting, and the consequences have been unfortunate. One of the remedies proposed by the *Quarterly Review* is that a second exhibition should be held every year, in which architecture, sculpture, carving, drawings and engraving, with minor arts, should alone be represented. That may afford some compensation for existing shortcomings, and it deserves to be tried as an experiment. But much more requires to be done. The representative character of the Academy should be restored or recreated, and until a revolution of that kind is accomplished the professed aspirations of the founders will not be realised.

THE NEW LIGHTS FOR OLD BILL.

ALTHOUGH it has been once read in the House of Commons few Parliamentarians can expect the Bill for amending the law relating to easements of light to become an Act in the present Session. There are too many measures which are supposed to be of more pressing interest requiring consideration and to which precedence will be allowed. The delay will not be disadvantageous. Any Bill having for its sponsors lawyers of the standing of Mr. FLETCHER MOULTON and Mr. HALDANE, besides Messrs. ROBSON, H. D. GREENE and H. ROBERTSON, would not be taken as immature, but, on the other side, its production being attributed mainly to the Royal Institute of British Architects and the Surveyors' Institution, it labours under the prejudice of being suspected of inheriting some taint of professional disorders. At the present day there is always scepticism about lawyers' experiments in legislation, but in the Ancient Lights Bill experts as well as advocates, the gentlemen who derive most profit from the actions, are combined. On that account it is not likely to secure public approval without close examination. Whenever success depends on confidence in the creators of a Bill it should have its origin with the Government of the time. The reform of the law in this case would be a public benefit, and should not be left to an endeavour by private members.

Few men can be considered as making land in the way the Northern Farmer "stubb'd Thornaby waiste." Yet land is treated like manufactured goods. Light can be still less a product of human industry, but it is believed to be so much of an individual possession that, as Lord CRANWORTH once said, it is not sufficient to assert that no loss arises to a plaintiff because he can continue to carry on his business as successfully as before the obstruction arose. It is no exaggeration to suppose that with light the dog-in-the-manger policy is allowable, for the Courts will not be satisfied with investigating how far light, considered as an "accessory to a corporeal hereditament," was used by a plaintiff, but the possible uses to which it may be turned by his representatives at a future period, and for purposes which are now unknown.

In our time science, and especially optics, has endeavoured to impart some certainty to claims and defences. But at an earlier period the sacred rights of property must have guarded outlooks to an amazing extent. There was, however, one possibility available for those who wished to build in the neighbourhood of one of those absolute proprietors. From the reign of HENRY III. the Courts granted limitations to claims of various kinds, varying from sixty

years to four years. By the Statute of Limitations custom was changed into a right. The Act of JAMES I. is exceedingly miscellaneous, for it treats of the king's claims to concealed manors, the custom of paying twopence on every caldron of sea coals at Newcastle-on-Tyne, actions of trespass, and so forth. But it was a recognition of the principle of the necessity of time as an element in the creation of certain rights. About 200 years afterwards the Prescription Act of WILLIAM IV. made the enjoyment of light for twenty years become a right which was absolute and indefeasible. Limitation being once accepted, much follows from it which was not anticipated. The popular notion of an ancient light is that it is an obstruction to building, and many an excellent site is left vacant for years through apprehensions of the actions which are sure to arise when a structure is erected. But as in other matters, there are two sides of the subject to be considered. A large amount of inconvenience is caused by new buildings to the owners and occupiers of those which are older, but there is no redress. The phrases "dominant owner," "servient owner," "dominant tenement," "servient tenement," are suggestive of feudalism and injustice, but as affairs turn out the servient owner and his tenement sometimes become the most intolerable to those who contemplate the relations judicially.

The phrases are introduced in the new Bill. The dominant owner's right to light (for the subject of air is prudently neglected) is limited "to such amount passing over the servient tenement as is reasonably necessary for the comfortable use and enjoyment of the dominant tenement if a dwelling-house, or for its beneficial use and occupation if used as a place of business or for any other purpose than a dwelling-house, and he shall not be entitled to any extraordinary amount of light necessary for any particular purpose, trade, or occupation." There is no chance of gain, for "nothing in this section shall confer on the owner of any dominant tenement over the tenement servient thereto any right to a greater amount of light than he would have possessed if this Act had not passed." Nor does the section apply to a tenement in which "a trade or occupation requiring an extraordinary amount of light has been continuously carried on for ten years—during the continuance of such trade or occupation." The section applies only when the right of the owner becomes absolute and indefeasible after the commencement of the Act.

At present obstruction to light must be by means of some material body. A stack of packing-cases has been held to be an obstruction. By the proposed Bill an obstruction in the form of a notice will be sufficient. HAMLET tells us we should "find quarrel in a straw when honour is at stake," and as insignificant a trifle will serve as a *casus belli* hereafter. It is a true mathematician-lawyer's device. An owner who fears his tenement may one day become servient to his neighbour's has only to send a notice corresponding with one in the schedule, and "on and after the day of service of an obstruction to light notice the access of light to the windows mentioned in the obstruction to light notice shall be deemed to be obstructed in like manner as if the same were actually and physically obstructed." Any person aggrieved by the notice can seek the same remedy as if there was an actual or physical obstruction. The notices are to be treated with respect, instead of being cast into a waste-paper basket. According to the Bill, on the sale of any tenement it shall be the duty of the vendor to disclose any obstruction to light notice which may have been served in respect of that tenement, and it shall be the duty of any person who may receive an obstruction to light notice under this Act, in respect of a tenement which he holds as occupier or lessee for a term of years or for lives, to forward or deliver such notice forthwith to his next superior landlord.

It sometimes happens that public improvements lead to a number of actions for obstruction to light. Public buildings of a grandiose character are in consequence occasionally treated like hideous factories. BRODRICK'S law courts and town hall in Leeds had for a time to be delayed until the claim made by the owner of a two-storey building for obstruction to light was settled. The new Bill says:—"No title shall be acquired by prescription under the Prescription Act, 1832, or at common law or otherwise by the owner of any building which shall have been erected after

December 31, 1890, and which abuts on any street, to a right to light passing over a tenement on the opposite side of that street."

An impetus will be given to the preparation of plans. The owner of a building which is to be taken down and rebuilt may cause plans, elevations and sections of such building to be prepared. He may also apply to the official surveyor for a certificate of the correctness of the plans, sections and elevations. Fees are to be paid to the surveyor whether he grants or refuses to grant the certificate. If not granted it will be necessary to prepare fresh plans. If the applicant is dissatisfied with the refusal he can make application to a new Tribunal of Appeal. The certificate is to be taken as conclusive evidence of the correctness of the plans in any action which may follow. The official surveyor, who may be a district surveyor of the Metropolis, a county surveyor or a borough surveyor elsewhere, is to keep a register of the drawings, which are to be open for inspection at the town or county hall on payment of a fee.

Whenever a servient owner contemplates rebuilding or alterations he is to give facilities to the dominant owner or his representative to inspect the plans, sections and elevations; and if there are no drawings he must give such information as may reasonably be required. Within seven days he is to serve a notice of his objections or the terms on which he is willing to permit the servient owner to construct his building. The notice is to contain particulars of the dominant owner's interest and the name of a surveyor who will act on his behalf. If within seven days the servient owner announces that he accepts the terms of such notice, it will be deemed that an agreement between the parties has been come to. If the servient owner refuses the terms, he is to give notice thereof and to state the name of a surveyor who is to act on his behalf. The two surveyors are to endeavour to determine the questions in dispute, and should they fail the matter is to be referred to an umpire, who must be a member of the Royal Institute of British Architects or the Surveyors' Institution. In the event of either party neglecting to appoint a surveyor or of an umpire refusing to act, either party can apply to the President of one or other Society to appoint an umpire. The award is to be taken as conclusive and as not to be questioned in any Court, but either of the parties may appeal to the Tribunal of Appeal, where the award can be rescinded or modified. Where the amount awarded exceeds 500*l.*, and one of the parties refuses to accept the decision of the Tribunal of Appeal and gives security, to be approved by the Tribunal, to prosecute his appeal, all proceedings in the Tribunal shall be stayed, and the appellant may bring an action in the High Court against the other party. The procedure is to be similar to that followed in a commercial court of the High Court, or as near thereto as circumstances permit.

The Tribunal of Appeal for the purposes of the enactment is to be constituted as follows:—The Secretary of State will appoint three members, who are to be barristers; the Royal Institute of British Architects and the Surveyors' Institution will each appoint three members. The appointment is to be for a year, but the members would be eligible for reappointment. The Lord Chancellor can remove any member for inability or misbehaviour. Not less than three members, of whom one is to be a barrister, shall attend at the hearing of any case. The sittings can be held in any part of England most convenient for the determination of the proceedings. The fees are to be arranged by the Secretary of State, as well as the salaries of such clerks, officers and servants as may be appointed. The members assigned for the purposes of each case are personally to visit the tenements of the appellants and the respondents, and can determine to what extent the proposed new buildings are to be amended or the dominant premises altered. They have power to hear the parties either in person or by counsel, and to require the production of any documents or books required. Subject to the approval of the Lord Chancellor, they can make regulations as to procedure. Any order of the Tribunal of Appeal may be enforced by the High Court as if it had been an order of that Court. Whenever an injunction is obtained either party may apply to a judge of the High Court.

There may be opposition on the part of lawyers to the contemplated arrangements. Practically what is proposed is the creation of a technical court, in which, as far as possible, the whole of the duties will be discharged by architects and surveyors. Everyone who has had to attend courts, whether in the Metropolis or at the assizes, in which actions for interference with light were tried, could hardly have failed to pity the judges. They have to deal with difficulties for which they must have felt that neither experience with cases nor the ordinary logic of law was of much avail. Optical and mathematical problems were introduced, depending on subjects which they had neglected since they left college. The irritation often caused scenes like those which were common in Vice-Chancellor MALINS'S Court, and which to an ordinary observer were not calculated to uphold the majesty of the British law. When two architects or surveyors have to fight out their case before a third as umpire, the stage play and eloquence permitted in civil courts will not count. The points at issue will appear in all their simplicity as bricks and stones and mortar. There will be no chance of concealing defects by verbiage. The majority of the cases will probably never have to go before the Tribunal of Appeal, for litigants are not likely to have the gratification of seeing their conflict described at length in the public journals, as the new tribunal will, we suppose, be as much neglected by reporters as that forming part of the machinery of the Metropolitan Building Act. But so revolutionary a change necessarily must meet with opposition, and for that reason, as we said before, we consider the Government should have assumed the authority for dealing with so intricate a subject.

Various changes in the procedure respecting claims for interference with light have been suggested by architects and surveyors from time to time. The principal features in the new Bill were indicated five and twenty years ago in an article in *The Architect* by the late Professor ROGER SMITH. One extract from it will be sufficient to prove that the authors of the Bill cannot claim much credit for novelty. He wrote:—

It should be enacted that by giving a certain amount of public notice, and giving, if necessary, a security sufficient to meet all claims for compensation lodged during a certain time, an owner of property should be entitled to carry out a definite plan of improvement, all his neighbours whose lights are affected being entitled to compensation (assessed by arbitration or a jury), and to the same additional amount which is customary in a case of compulsory sale. Perhaps the operation of such a scheme might be much as follows:—Let us suppose A to be the owner of property in London or Manchester, which he desires to rebuild. He may, if he pleases, proceed just as is customary now, namely, giving no more notice of his intentions than he can help, attempting to surprise his neighbours by running up his obstruction before they can make up their minds what to do, and taking the chance of their being bold enough or quick enough to take the legal steps necessary. In short, he may as now take his chance, but he may, if he pleases, put himself under the protection of the proposed new Act by advertising two or three months beforehand in the newspapers, posting a notice on the door of his premises, and depositing a copy of his plans in the official surveyor's office, or in that of the district surveyor. Before his notice has expired, any adjoining owner gives notice that his rights of light will be affected, and that his claim amounts to 1,000*l.*, the building must not be begun till satisfactory security to the amount of 1,000*l.* (or of such less sum as the Court by some quick process may order) has been given, and at the expiry of the notice the building may proceed, and after on its completion or earlier all claims are to be investigated by an arbitrator, if the parties can so agree, or otherwise before a jury or a vice-chancellor; but no claimant to have the power of moving the Court to stop further progress of any building with respect to which notice had been given, unless (1) it was begun before the notice had expired or withdrawn in due form, or (2) security for the amount of a claim lodged before the expiry of the notice had not been given, or (3) the deposited plan had been departed from. An embodying some such arrangement as this would probably be quite as much relief as it is necessary to afford, and would be open to the objections which might be urged against a sweeping measure.

In the new Bill the procedure is somewhat simplified, it has yet to be seen whether ROGER SMITH'S proposal will not be more acceptable to Parliament.

SAFEGUARDS AGAINST FIRES CAUSED BY LIGHTNING.*

THE number of buildings damaged by lightning in this country varies slightly from one year to another, but is so far constant that it is perfectly safe to say that in the course of any ten years between 3,000 and 4,000 suffer from this cause, of which about 200 are churches.

Statistics that have been published show that thunderstorms are gradually increasing over the whole of civilised Europe. Thus, in the course of sixty years the average number of such storms in London has increased from twelve to twenty-two per annum. Considering the number of lightning discharges in these storms, it appears evident that damage would be very much more frequent if it were not for the number of lightning conductors in use. Conductors, however, are not always successful. They sometimes fail when they appear to have been applied in accordance with the better known rules supposed to govern the subject. On the other hand, cases occur in which conductors that would be condemned as inefficient under those same rules answer perfectly when struck by lightning. This anomalous state of affairs shows that there is some important factor that is very frequently overlooked, and which must be the crux of the question.

I propose placing before you certain aspects of the matter which will demonstrate what I consider to be this overlooked factor, and which must be accorded their proper significance if efficient protection is to be secured.

Probably one of the causes that interfere with a clear conception of the methods necessary for protection is the view that is often taken as to what a discharge of lightning is. Although the idea of a thunderbolt accompanying a lightning flash is known by scientists, and probably by the majority of the public, to be illusory, there is still a tendency to regard lightning as something which leaves a cloud and damages a building or other object by striking it. The language used in connection with the subject unfortunately fosters this idea. Even the term "struck by lightning" is, I consider, scarcely correct, though for want of a better I shall have to use it frequently in the course of this paper.

At the best lightning is too often regarded as an electric current overcoming the resistance of the air, but this resistance has nothing in common with that which is the subject of Ohm's law, and to consider it merely as a momentary current is apt, I think, to give a somewhat misleading view of the matter. I want you, in the course of my remarks, to regard it as a breakdown of the dielectric—not as something leaving the sky to come to earth, or as being hurled from the clouds to strike a building, but to consider it—as it indeed is—as a fracture or cracking, both of the air and of any other resisting medium between the oppositely charged bodies, the clouds and the earth. As a mechanical analogue, one may liken the air under these conditions to a thick slab of glass, or other strong material, subjected to an enormous pressure from above and below, and which will crack when the pressure is greater than the material will bear; a building may be considered as a weaker object firmly embedded in the glass. We may, in fact, regard ourselves as living between the inner and outer coatings of an enormous Leyden jar or other condenser.

Now when the stress to which the air is subjected has reached the breaking point, which is about half a gramme weight per square centimetre, the line of the fracture becomes visible by the intense heat making the air particles momentarily incandescent, and this we call "lightning." The building which, being in the line of the strain, gets damaged, forms only a part of the fracture; the air is equally damaged, but is a self-repairing medium. Unfortunately, our buildings, trees and bodies, which are less resisting than the air, are not self-repairing, and so we get the deplorable losses of life and property that occur every year.

Let me say here that, even allowing for the effects of induction, lightning can no more be said to be attracted by a conductor than a crack across a sheet of glass can be said to be attracted by any weak part which would cause it to take other than a straight course, or than a brook winding through a meadow can be said to have been attracted by the softer ground through which it has carved its way. At the top the conductor would be provided with a point, or several points, so as to prevent the discharge occurring if possible, and, if not, to try and render it less violent. As regards the lower part, if it ended at the ground line the conductor would answer, provided there had been rain and the surface of the ground was wet, but if the flash occurred in dry weather there would be resistance to overcome between the conductor and the conducting stratum below causing heat, and the least that would happen would be that the ground at this point would be blown up. This might be considered not worth the expense of making a good earth connection to prevent, but one cannot

* From a paper by Alfred Hands, prepared for the International Fire Congress.

be certain that this would be the only effect. The explosive force in such a case is often equal to that of some pounds of gunpowder, and so there is danger of damage to the brickwork or foundations. A fairly good earth connection is therefore advisable, but it need not be a "perfect earth"; so long as the resistance is fairly low and the conductor is of such a size as not to be fused, we can feel confident that it will answer in this case.

It must not be supposed that I am stating that a good "earth" is never necessary; in very many cases it most certainly is. What I wish to imply is that a good "earth" is a matter of comparison. One cannot fix a limit of so many ohms and say beyond that a conductor "earth" is inefficient, for under certain conditions a conductor would not fail with an "earth" resistance of 100 ohms, or even hundreds of ohms, while under others two or three ohms would be too much. A discharge would not leave a conductor, even if there was a fairly high resistance, to go to earth by another route unless there was a rival one open to it. By a good "earth" I mean one that has a low resistance in comparison with any other possible "earth" in its neighbourhood.

Now, suppose that instead of the structure being composed of a solid mass of bricks or stone it was made hollow, with a stone staircase in the interior and a gas pipe carried up to afford light at intervals, the conditions would be entirely changed. There would then be a rival conductor in the interior with a perfect earth connection; for gas pipes, owing to the extent of the surface of the mains underground, have merely nominal "earth" resistances, and if the conductor had a higher one the discharge would either be entirely diverted to the gas pipe or be divided between the conductor proper on the exterior and the accidental one in the interior, according as the resistance of the former was great or small. It is not practicable to make the "earth" of the intended conductor appreciably lower than the gas main, but if we succeeded in getting it so to a fractional extent there would still be the dangerous rival inside, and there would be a side flash, or let us say a side fracture, between the two conductors if the brickwork or air between, as the case might be, was not sufficiently strong to resist the stress suddenly thrown upon it. It would be necessary then, besides having a perfect "earth," to place the conductor so that there should be a sufficiently strong buffer of resisting material between the two as to make it impossible for the discharge to break through. I do not mean by this the use of glass insulators or keeping the conductor a few inches away from the wall, but by a considerable space of resisting material.

We have to look the fact squarely in the face that side flash, or sparking, will occur between a struck conductor and other metals sufficiently near it. A perfect "earth" does not prevent side flash, it only reduces the sparking distance; a comparatively bad "earth" increases it. We must therefore see that the other metals are at a safe distance, or make connections across to act as a conductor for the spark. I have reasons for fixing the safe distance between two perfectly "earthed" conductors, in the most extreme cases, as 5 feet for ordinary building materials, while in some cases, depending on the course of the accidental conductor, it is considerably less.

We have been considering in these diagrams the most simple cases one could have to deal with. If all buildings were like these a schoolboy might, with half an hour's instruction or by means of a few set rules, learn to protect them perfectly. Unfortunately metals are introduced very largely into the construction of modern buildings. You will see metal-cowls on chimneys, lead flashing round chimney-bases, rain-water pipes and gutters, fire-grates, girders, gas and water supply pipes, &c., forming a most complicated problem. Is it any cause for wonder when lightning conductors are put up, as they generally are, absolutely regardless of these accidental conductors, that cases of failure occur? I consider that to put a single conductor on such a building, expecting it to attract lightning and carry it away, would be like putting a pipe under two or three of the holes in the bottom of a tin colander, and expecting the pipe to attract the water to the holes directly over it, ignoring all the other holes.

I have found that on an average about a dozen cases of failure of conductors occur in this country every year. The only wonder to my mind is that there are not more.

Cases of failure may be divided into five main classes or headings.

(1) Where the conductor is not touched, the discharge taking an entirely different course. Such cases are not very interesting, and ought scarcely to be called failures of conductors—they are merely failures of the sanguine expectations of those who put them up.

(2) Cases in which the conductor is struck and damage occurs owing to non-compliance with the more elementary rules appertaining to the subject. Such cases are not very serious as a rule. The ground may be blown up owing to a very high resistance; the conductor may be broken or fused at a bad joint; or it may be torn loose owing to a bad bend.

(3) Cases where a part or the whole of the discharge leaves the conductor and takes another course through accidental conductors to earth. Such cases are primarily due to there being alternative paths available for the discharge, and they often result in very serious damage. If inflammable materials happen to lie in the path the risk of destruction of the building by fire is very great. The most dangerous form of alternative path is a gas pipe, and soft metal pipes are especially so.

(4) Where sparks occur between lightning conductors and neighbouring metals not leading to earth. These cases do not usually result in very serious damage, unless fire is caused by something inflammable in the line of the spark.

(5) Where there is no side flash from the conductor, but sparks occur between two metals distinct from the conductor. These cases are very interesting, but fortunately are not very common. They are apt to cause fires, in fact, it is often the setting of the building on fire that shows such an effect has occurred.

The view that is often taken of a lightning conductor appears to me to be erroneous in one respect. It is regarded as a piece of apparatus intended for a certain purpose, and which should, therefore, perform its allotted function. Consequently too much thought is directed to trivial details, such as the particular form of conductor, its fastenings and accessories, and too little is extended to the fact that the question of its efficiency or non-efficiency depends on the way in which it is applied rather than on the conductor itself. A piece of apparatus might be depended upon, if a good one, to work in any place. A telephone, for instance, might answer equally well whether placed in one room or in another, but a lightning conductor is entirely different, because placed in one position it might be perfectly efficient, while the same conductor placed in another position would fail owing to the different conditions existing in its neighbourhood.

With due apologies to the medical profession for the comparison, I venture to say that a conductor is more nearly comparable to the drugs that a physician prescribes, as and when he considers advisable, than to a piece of apparatus turned out of a workshop, and only requiring putting together in accordance with a few set rules to produce certain results under an and every conceivable condition. For what is a lightning conductor after all? Merely a thread of metal among the many other threads of metal in a building. It is put up especially to afford a path for lightning because for various reasons it may not be advisable to use the other threads for the purpose. But if it is not properly applied it is no longer a safeguard; the other threads become unintended lightning conductors and, in sharing the discharge among them, damage may result—not the least serious of which would be the setting of the premises on fire.

There is a tendency to regard protection from lightning too much as being the mere putting up of lightning conductors. A century ago, when buildings were differently constructed, it was, no doubt, all that was necessary in most cases; but these days, when metals are so largely introduced into the construction, the conditions are altogether changed, and some most difficult problems are often presented even by what might at first glance be regarded as simple constructions. The protection from lightning often consists of a good deal more than the mere erection of conductors. The part that often makes the difference between efficiency and non-efficiency is the making of various connections to bridge over what I call sparking gaps, as well as keeping a safe distance away from metals that it would be dangerous to connect to.

It is difficult to set any rule as to the places where connections have to be made. They can only be judged on consideration of the conditions that would exist at the moment of discharge. I may however say that they would be the places where there would be great differences of potential. A spark is, of course, the outward and visible sign of a difference of potential. If this difference is not sufficiently great for the spark to bridge the gap between the two metals, the effect will occur.

It is said that side flash is due to self-induction. Not I attach very little importance to this. It exists, of course, but a conductor cannot take a sudden discharge like a flash of lightning without there being enormous self-induction, but for this very reason it may, for practical purposes, be disregarded. As it cannot be entirely done away with, it is difficult to say what would be the practical effect of a lightning conductor absolutely without self-induction.

Experiment shows that by increasing the self-induction increases the sparking distance, and conversely, that by reducing it one reduces the length of spark. Now, the way to reduce the self-induction in a lightning conductor is to give it a number of sharp bends, thus, to run it backwards and forwards across the face of a building instead of direct down to earth, but I do not suppose that anyone would seriously recommend such a method of procedure as conducive to efficiency. Then, again, looking at the matter from a practical point of view, if you were to

erect a lightning conductor in the centre of a field, with absolutely no other metals near it, you would still have self-induction, but there would be no side flash. Self-induction with no other metal near is of no moment; self-induction with other metals near is; therefore I consider that the point of practical interest centres in the "other metal," and not in self-induction.

I have already referred to the cases in which sparks occur between two metals quite distinct from the conductor. Such effects are, I think, far more common than might be supposed, and many mysterious fires, many so-called extraordinary freaks of lightning, may be explained by them. In considering a subject like this, one has to form a sort of mental picture. In a way one may liken the electric potential of the earth, or rather the part of it under consideration, to the water-level of a lake or sea. It may be higher at one time than another, but any deviation from that level, whatever it happens to be at the time, implies an unnatural state, and therefore, there will be a tendency for any displaced portion to return to the general level.

Now, consider the effect at the moment that a discharge of lightning takes place. There is an enormous difference in potential at one place. One may liken it almost to a water-spout forming on a lake and then suddenly collapsing. The effect in that case will not end just at that one spot; there would be disturbance and waves propagated along the water. So I think at the moment of a lightning discharge the effect cannot begin and end just at the one spot struck; there must be waves of potential, if I may use the term, set in motion, and the effect would be visible as a spark at places where one metal approached another, provided they happened to be set in just the right manner. These effects are not very serious as a rule, but they may cause fires if the conditions are suitable, and they therefore require guarding against by connections at the critical points. Looked at from the point of view I have indifferently tried to place before you, not only do many of the so-called vagaries of lightning become intelligible, but one can, I think, see where these peculiar effects would occur, and take means to guard against them.

It may be asked, Is there no way in which protection can be secured without the tedium of mastering the subject, or of having to depend on an expert? Yes, there is one way; but I do not think that it is one that will become general. It is to adopt what is called metal screening. If you were to cover a building completely with metal from the top of the chimneys down to the ground line, making earth connections on each side, you would have a sort of metal cage, inside which no electrical effects would occur. You might have metal ramifications of all kinds, but there would be no sparks within the structure. It would not even be necessary to have the structure entirely covered with metal. One might run a large number of wires over it, both vertically and horizontally, so as to make a metal cage, and obtain the same effect, provided that no metal was allowed to pass into the building from the outside without being connected to the cage; but the meshes formed by the wires would require to be comparatively small. It could not be sufficient to run just a few conductors over it, and get a sort of skeleton cage. There is a case on record which shows that this does not afford metal screening.

For very dangerous places, such as explosives magazines and factories, metal screening is generally the best, and often the only safe course to adopt; but for other buildings I think the enormous expense and unsightly appearance of the cage system of protection would render it impossible of general adoption. It may, however, be adopted partly in places where there is some dangerous alternative path which it is found possible to keep the conductor sufficiently far from. Such a cage would be represented by a flèche with clock faces illuminated by gas lights. If the flèche was lead-covered it would readily form a metal screen, and a very little addition would make it perfect; but if not small sized conductors should be lead over it to form a cage.

For general purposes, however, the system to be adopted is intelligent consideration of the conditions that may exist in a structure to be protected. Knowing the conditions and their effect, connections must be made between the lightning conductor and any metals so near to it that they would constitute weak spots where side flash would occur, and even between the metals and others, or between two independent metals, if they were so placed as to cause sparking.

Conductors must be kept sufficiently far away from other things that it would be dangerous to connect to, such as pipes; in other words a sufficient distance of resisting must be maintained. I would particularly say beware of alternative paths; they are the cause of the greatest amount of damage in failures of conductors.

In arranging a conductor system it must be borne in mind that there are certain parts of a building that are exposed to be struck, and therefore the system must comprise lines of connection from all those parts. To protect one and leave another unprotected is waste of money.

Earth connections are important, and it is necessary to get

the lowest resistance of any possible "earths." For this purpose a large extent of metal surface underground is a necessity. This may be obtained by means of earth-plates, or connections to gas and water mains, or by both, but in making these connections caution is necessary. Complications sometimes occur that would render them disastrous. Earth-plates should be proportionate to the moisture in the soil, never less than 3 feet square, or equivalent area, in a wet situation, while in dryer ones the plates must be increased in area proportionately. Within certain limits it may be said that doubling the area of surface contact reduces the resistance by half. Thickness of the earth plates makes practically no difference in this respect. In somewhat dry soils resistance may be reduced by bedding the earth plates in coke, but coke should not be used unless it is absolutely necessary.

As regards the best kind of conductor to use I consider that, taking into consideration durability and cheapness, copper is the most suitable metal, and as regards form, copper tape, band or ribbon, as it is indiscriminately called, is the best for similar reasons. Copper rope answers sufficiently well for a time, but it is not so lasting as tape.

In conclusion, I may say do not make the conductor system unnecessarily prominent. Buildings can be efficiently protected without disfiguring them with over obtrusive lightning conductors.

KENT ARCHÆOLOGICAL SOCIETY.

AT the annual meeting of the Society, which was held last week in the Guildhall, Rochester, Mr. George Payne, the hon. secretary, read the forty-sixth annual report of the Council of the Society, from which it appeared that the visit was the third to the ancient city of Rochester, the last having been in 1886. Since that time a flood of light had been thrown upon the history of the city by the researches of Mr. W. H. St. John Hope, the Rev. G. M. Livett, and the hon. secretary, and the visit was therefore expected to be much more instructive and interesting than heretofore. Since they had last met the Society had lost several valuable members by death and other causes, notably Mr. James Foster Wadmore, Canon F. H. Murray and Mr. T. F. Peacock, F.S.A. Eighteen new members had joined the Society during the year, and a member awaited election. The Council had appointed a finance committee, and the balance-sheet would henceforth be drawn up by a chartered accountant. A treasurer would also be appointed. During the year no important archaeological discoveries had been made. The Council viewed with much satisfaction the spirited action of the Corporation of Rochester in securing and restoring at great cost that fine example of Domestic architecture, Eastgate House, and converting it into a local museum. The Council had recently made a further grant of 25% towards the very important excavations still going on at St. Austin's Priory, Canterbury. The balance at the Society's bankers, together with the deposit account, was 619*l.* 14*s.* 11*d.*

The cathedral was visited under the guidance of the Rev. G. M. Livett, and the Norman castle under the guidance of the hon. secretary, who also conducted the members round the ancient mural defences of the city and over Eastgate Museum.

MANCHESTER SOCIETY OF ARCHITECTS.

ON Saturday, July 25, the members of this Society visited Bournville, near Birmingham, Messrs. Cadbury's model village. Mr. W. A. Harvey, the architect, kindly met the party, and showed them over a considerable part of this most interesting estate.

Several houses were examined throughout, and the nearly completed Ruskin Hall was much admired. It was thought that the great success, both social and architectural, of this experiment should do much to encourage similar schemes elsewhere.

The fine church of St. Agatha, Birmingham, was then visited, under the guidance of Mr. Bidlake, the architect, and also Messrs. Keep's warehouse, a refined piece of work by the same architect. The day was concluded by a visit to the Eagle Insurance Company's offices, Messrs. Lethaby & Ball, architects, where the interior, with its beautiful marble and plasterwork, was especially admired. Some of Mr. Edgar Wood's work at Middleton was visited on Tuesday evening, July 28, by twenty members. The Old Road chapel has been lately decorated by the architect and Mr. Jackson, the painter, and has a charming internal effect of rich colouring. The new Wesleyan chapel is an excellent piece of grouping, arranged picturesquely round a cloister or courtyard. Mr. Wood's own house is full of interest, and the formal garden he is developing shows what good results can be got on a very small scale.

NOTES AND COMMENTS.

THERE is a standing grievance among officials of the India Public Works Department with respect to the value of the rupee. Appointments are accepted in England at certain salaries to be paid in that coin. But when the engineer or other technical officer receives his first payment in India he is astonished to find that the value of a rupee is different in England and in the East. Mr. BURT, a civil engineer who has held an appointment since 1878, tested the regulations in a case which was brought by Mr. ASQUITH, K.C., before Mr. Justice JOYCE in the Chancery Division on Tuesday. He entered the service through Coopers Hill College. He was attracted by a prospectus he obtained at the end of 1874, and which professed to relate to the year 1875. His salary was to be 1,300 or 1,400 rupees per month, but he had to submit to the diminished value. There was one opportunity of receiving the full sterling amount. In the regulations it was stated that if payment be taken at the Home Treasury the rupees are to be converted into sterling at the rate of exchange fixed for the time being for the adjustment of financial transactions between the Imperial and the Indian Treasuries. When in 1897 and in 1899 the plaintiff had taken his holidays and came to England, he found that at the Home Treasury he was still paid at the rate of 1s. 6d. per rupee instead of the 2s. mentioned in his prospectus. He therefore sought to recover 310l. 7s. 1d. On behalf of the Secretary of State for India it was contended that the prospectus was superseded by another, of which the plaintiff had never received a copy. Mr. Justice JOYCE dismissed the action. His Lordship pointed out that there was no evidence that plaintiff had been misled. All that could be said was that in the prospectus there was an incomplete series of extracts from the Code with regard to payment. The Government were entitled to alter their arrangements from time to time, and those issued after 1875 must have been accepted by the plaintiff. The issue will be disappointing to many officials, for what adds to their hardship is that while the civil engineers engaged on one work are paid at the rate of 1s. 6d. per rupee, the Royal Engineers receive 2s. Mr. BURT's case would be considered by ordinary employers as requiring a different solution. When a man is appointed at a certain salary it is understood he will be paid the amount so long as he performs his duties. If at a subsequent time men come in at a lesser amount, that does not affect the employes previously engaged, unless they agree to accept a deduction of their salary. We suppose the real reason is that it is difficult to make ends meet in India, and officials are treated differently from those in the Civil Service of Great Britain.

THERE is one aspect of Papal conclaves which does not receive much attention from the majority of people. They hear about the closing of the Vatican Palace, and conclude that what is done bears some resemblance to what would be needed in securing isolation if an infectious illness broke out in a large building in England. Tradition counts for much in Rome, and it is remembered that repeatedly the arrangements for securing an election without disturbance from exterior forces resembled those which would have to be carried out if the palace of the Popes was about to undergo a siege. At the election of GREGORY XVI. in 1831 the preparations involved an expenditure of 723,631 francs, or nearly 30,000l. That was a large sum for a temporary purpose, for the protection is generally needed for no more than a few days, and has to be again removed. On the death of PIUS IX. it was resolved that economy should be respected, and a sum of 150,000 francs was set down as the utmost limit. Under the direction of Signor MARTINUCCI, the architect, the closing cost only 57,871 francs. The largest items were carpentry and joinery, 22,394 francs; masons, 10,237 francs; locksmiths, 5,300 francs; painters, 6,100 francs; stonecutters, 910 francs; stuccoists, 2,827 francs; glaziers and plumbers, 3,900 francs. Signor VESPIGNANI was entrusted with the alteration of the Sistine Chapel into a hall for the conclave, and the cost of the work was 19,961 francs. The occasion is usually taken by the humbler classes of officials and servants to make demands for requirements which are costly. But in most parts of the world deaths generally lead to waste of money.

CATHEDRAL SERIES: EXETER.—WINDOW TRACERY, NORTH AND
SOUTH SIDE OF CHOIR.

ACCORDING to some investigators of the history of Exeter Cathedral, the credit for the most characteristic work should be given to Bishop PETER QUIVIL, who was elected in October 1280. The conclusion confirms the statement in the fifteenth-century chronicle, viz., "Fundata est hæc nova Ecclesia a venerabili patre PETRO, hujus Ecclesiæ Episcopo." He was a native of Exeter, but as his mother's name was HELOISA, it is supposed that on one side at least he was of French descent. His arms were "azure, a cross argent, between two roses in chief, and two fleur-de-lys in base or," or a combination of the roses of England with the golden lilies of France. Archdeacon FREEMAN, whose excellent history should be studied by every visitor to the cathedral, endeavours to trace a connection between the arms and the tracery of the windows. He writes as follows:—"There was probably a further and deeper meaning in his assumption of this cognisance. The rose is by ancient usage the symbol of OUR LORD'S divine royalty, the lily of His human nature: so that the coat, uniting these to an azure field and a pure white cross, is largely symbolical of the mystery of our salvation. And the aim of QUIVIL'S life, it may well seem, was to carry out this beautiful symbolism in the goodly church over which he was set to preside. He it was who first imparted to its interior the cruciform shape, and who provided that each arm of the cross should be enriched with the most lovely window tracery, exhibiting almost to the exclusion of every other form, those of the lily and the rose. The pattern in each case is of a large rose, set round with lilies or roses, or both, and resting, as it were, on 'two heaps of lilies,' one on either side. This for the extremities of the cross, while throughout the whole church, with the rarest exceptions, every window-light head is a trefoil or fleur-de-lis. The nave windows below (except the two western bays) are of the lily pattern throughout, while in the nave clerestory there is a regular alternation in the heads of circles or roses with curved triangle or lily forms. And all through the church the triforium arcade, with the balustrade resting upon it, exhibits once more, in boundless profusion, the golden lilies below the argent roses above." Expositors of the mysteries of Gothic architecture are usually enthusiasts for symbolism. If Exeter Cathedral were unique in affording examples of combinations of Perpendicular mullions and trefoil heads with circular tracery above them there would be some plausibility in the Archdeacon's conclusions. But throughout England there are many examples of similar treatment it is hardly fair to assign to Bishop QUIVIL the whole credit for a system which was generally applied.

SHOPS, 20 TO 24 CAMBERWELL GREEN, S.E.

THE shops illustrated in this week's number are on the south side of Camberwell Green, and cover a site which was formerly occupied by several small wooden, tumble-down buildings which had existed there for probably over 100 years, until pulled down and replaced by the shops now erected. The situation is one of the best in the south of London, being at the junction of Camberwell Road, at the corner of Camberwell New Road and Denmark Hill and Peckham Road, four of the main thoroughfares in the south of London. Two of the shops were erected by Mr. PHILLIPS, and the other two were erected by Mr. REASON, of Rosebery Avenue, Clerkenwell—all under the superintendence of Mr. LEWIS SOLOMON, F.R.I.B.A., architect, 55 New Broad Street, City, at a total cost of a little over 7,000l. The fronts are of Ibstock (red Leicestershire pressed facings) bricks with terra-cotta dressings, and are an example of simple shopwork of good description.

HOUSE AT WIMBLEDON.

LANELEDGED RECTORY.

BERKS ARCHÆOLOGICAL SOCIETY.

THE Berks Archæological Society made their second summer excursion on Thursday, July 23, and, says the *Reading Mercury*, visited the beautiful Abbey of Malmesbury and, by the kind invitation of the Countess of Suffolk and Berkshire, the historic mansion of Charlton.

The Rev. P. H. Ditchfield described the historical associations of the abbey. He said that Malmesbury occupied a position of strategic importance and had great natural strength. It stood on a peninsula formed by the confluence of the Bristol Avon and Newton Water, while the third side of the triangular space was protected by a rampart which ran along a neck of land between the two streams. The name "Westport" preserves the memory of a fortified gateway. The mythical origin of Malmesbury was attributed to Malmud, king of Britain, father of Brennus, famous in Roman history, who was said to have founded the town B.C. 400, and called it Bladon. No Roman remains had been found there, and therefore it could not have been an important place in Roman times. The Saxons called it Ingleburne, and as it stood on the borders of Wessex and Mercia it was occupied by both kingdoms at different times. Tradition states that there was a nunnery here, and Leland mentions it, adding that the nuns were not quite so good as they should be, and were turned out by a Saxon archbishop. The real history begins with Maddulf, an Irish hermit, who lived in the seventh century, and obtained leave to have a cell here. He attracted many people by his pious life, and founded a monastic school to which hundreds flocked. Amongst them came Aldhelm, a relation of Ina, king of Wessex, first bishop of Sherborne, who founded the abbey. He was a man of great piety and virtue, worked several miracles, and sang beautiful songs to the wayfarers, and thus attracted them to listen to his teaching. He founded the beautiful gem of Saxon architecture at Bradford-on-Avon. Eleutherius, bishop of Wessex (672-76 A.D.), gave him a grant of land for an abbey and appointed him first abbot. He raised a church dedicated to the Holy Saviour, SS. Peter and Paul, and within the precincts another church dedicated to St. Mary, and a chapel to St. Michael, in which he was buried. King Alfred wished to make Malmesbury a seat of learning, and sent a learned Scot, named John, to teach them, but his pupils liked him not, and murdered him, stabbing him to death with their steel pencils. Athelstan was a great benefactor of the town. When he was fighting against the Danes he men of Malmesbury fought well and bravely, so he rewarded them with a grant of land which is still held by the burgesses, and divided into allotments varying from two to ten acres. When a burgess is admitted the steward gives him a turf and strikes him three times with a twig, saying—

Turf and twig I give to thee,
Same as King Athelstan gave to me.

Athelstan and his two sons, slain by the Danes, were buried here, and the tomb of the former erected in the fourteenth century remains. Abbot Alfric, appointed by King Edgar, rebuilt and restored the church of St. Mary and made it the principal one. The church of SS Peter and Paul was a smaller building, and stood on the south side of the south transept, wherein in Leland's time weavers had their looms. The church had two organs, one presented by St. Aldhelm, which was a mighty instrument with innumerable notes, blown with bellows, and had a gilded case. The other was made by St. Dunstan and had metal pipes. The Danes came to Malmesbury with the intention of plundering it, but one of them tempted to take a stone from the shrine of St. Aldhelm, and fell back as if he had been shot. So they left the abbey alone and fled away. William the Conqueror was a benefactor of this monastery, and gave to it the head of St. Owen, which he brought from Rouen, and Queen Matilda endowed the church with several manors. William of Malmesbury, born in 1075, the great historian, lived and worked here, and formed the library; he refused the office of abbot, preferring to devote his life to study. Bishop Roger of Salisbury built a castle here, which was destroyed in John's time. The present church was built in the twelfth century. In the thirteenth the monastic buildings were erected when William de Colerne (1265) was abbot, and included two halls, kitchen, bakehouse, dormitory, chapter-house, vineyard and church garden. In the same century the hospital of the Order of St. John of Jerusalem was built in the lower part of the town, of which a single arch remains. The abbey was dissolved in 1539, when Abbot Selwyn and twenty monks were imprisoned. The monastic buildings were gradually pulled down and carried away. The Tudor house near the church was built on the foundations of the infirmary. William Stump, a clothier, bought the abbey buildings from Henry VIII. for 1,500*l.*, and set up looms for his weavers in the chapel. His son or grandson gave the nave to the town for a parish church. The valuable monastic library was dispersed, and the MSS. were used to stop bung-holes in beer-barrels, to cover books, to wrap gloves and scour gun-barrels, for which they were

found especially serviceable. Malmesbury was the scene of many fights in the Civil War, and was occupied by both Royalists and Roundheads, and the marks of bullets can be plainly seen on the walls. It is a matter of regret that time has dealt so hardly with this majestic pile, but in spite of all the destruction that has taken place, it remains one of the most interesting buildings in the country, not only on account of its architectural beauties, but also for its most important historical associations.

Mr. Keyser described the architectural features of the abbey. He said that it was a matter of regret that so small a part of the building remained. Originally the plan consisted of a nave with aisles, a central tower with transepts and chancel. The large central tower and spire were higher than Salisbury, which was usually considered to have been the highest in England, but it was surpassed by the lofty spire of old St. Paul's Cathedral, London. The principal building belonged to the latter part of the twelfth century, and he considered that Malmesbury showed the earliest example of the pointed arch. The arches of the nave were all obtusely pointed, whereas the doorways were semicircular. The south doorway was one of the finest in England. He pointed out the elaborate ornamentation, which was very similar in style to the carved work seen in the Forbury Gardens, Reading, and in the garden of St. Lawrence's Vicarage. The Abbey Church at Reading and that at Malmesbury were built at the same time, though the Reading church must have been much larger. Mr. Keyser pointed out the prismatic billet ornament and the sunk lozenge on the arches, the fifteenth-century screen, the fourteenth-century roof, part of which here had been destroyed by the fall of the west tower, and the fifteenth-century "watching loft," which he conjectured might have been the abbot's pew.

The party afterwards drove to Charlton Park, where they were received by the agent, Mr. Bates, in the absence of the Countess.

Charlton Park.

The Rev. P. H. Ditchfield briefly described the house and the history of the family. He said that this house is especially interesting to Berkshire people as it is the home of the noble and illustrious family who take part of their title from our royal county. In ancient times this manor belonged to the abbots of the monastery, as Bere Court belonged to the Abbot of Reading. After the Dissolution it was granted to the Knivet family. Thomas Howard, the fourth Duke of Norfolk, married as his second wife Margaret, only daughter and heiress of Lord Audley of Walden. This nobleman was unjustly convicted of conspiracy in the matter of Mary Queen of Scots, and was beheaded in 1572. His son, Thomas Howard (born 1561), was a great naval officer in the time of Queen Elizabeth, was heir to his mother's estates, and was restored to his paternal estates in 1585. In 1603 he was created Earl of Suffolk and Knight of the Garter, and married as his second wife the eldest daughter of Sir Henry Knivet of Charlton, and widow of the Hon. Richard Rich, eldest son of Lord Rich. (The earldom of Suffolk was an old title revived. They would remember the unfortunate Earl of Suffolk who was butchered by the sailors when he was leaving England in the time of Henry VI.) He built Audley End, one of the most magnificent mansions in England. He performed great services to his country, suppressing the rebellion of the Earl of Essex, who had married one of his daughters, whose character was none of the best. He became Lord High Treasurer, and discovered the Gunpowder Plot. Finally he was accused of accepting bribes and dismissed the king's service. The elder son of this first earl (Theophilus Howard) inherited the title, became Privy Councillor and Lord Warden of the Cinque Ports. The younger son (Thomas) inherited his mother's estates here at Charlton, was Master of the Horse to Charles, Prince of Wales, afterwards Charles I., raised to the peerage as Lord Howard of Charlton and Viscount Andover, and created Earl of Berkshire in 1625. He would often be at Windsor with the young prince, hunting in Windsor Forest, and when he became an earl chose his title from the name of the royal county wherein so many happy days had been spent. He was devoted to his royal master, and was a great Royalist and fought in the Civil War. After the execution of Charles I. he lived here in retirement, and at the Restoration, as a reward for his fidelity, he obtained a grant of the farms of the revenues of post-fines for forty-eight years, amounting to the comfortable income of 2,276*l.* a year. Without mentioning the numerous members of this family he would only allude to the union of the titles. Owing to Henry, tenth Earl of Suffolk (d. 1706), dying childless, the earldom came to Henry Bowes, who was descended from Thomas, the first Earl of Berkshire and second son of Thomas, first Earl of Suffolk. Thus the titles were joined, and Henry became the eleventh Earl of Suffolk and the fourth Earl of Berks. This house was commenced by Thomas Howard, the first Earl of Suffolk, in the time of James I., and the parts erected by him are con-

sidered an excellent example of the Jacobean style of architecture. The west front was designed by Inigo Jones, and it is said to have been built by him before he had studied the works of Palladio and become deeply imbued with the influences of the Italian school. A great gallery extends the whole length of this front. The general plan of the mansion consists of a square with four fronts with towers at the angles, finished with cupolas and vanes. It is all built of stone, and measures 128 feet by 180 feet. Formerly there was a large quadrangle in the centre. This (as in the case of many other mansions) has been covered by a roof and a dome and converted into an immense hall. The south or principal front has a central porch adjoining square towers and wings at each extremity. In the basement of the porch is an arcade in the Doric style, an innovation on the buildings of Elizabethan age. The windows are mullioned with square heads, but in the upper storeys retain the Tudor labels. The parapets are enriched to an extreme with scrollwork, perforated, which ornament is continued up the gable ends and crowned with pedestals, orbs and obelisks. The north and east fronts were erected by Bretingham under the direction of Henry, twelfth Earl of Suffolk and fifth Earl of Berks, who was principal Secretary of State for the Northern Department in the time of George III. (d. 1779). The house contains a fine collection of pictures, which they would now have the pleasure of seeing. Mr. Ditchfield concluded by expressing their gratitude to the Countess of Suffolk and Berkshire for her great kindness in allowing them to visit her beautiful home, and to Mr. Bates for kindly making arrangements for their reception.

ROYAL ARCHÆOLOGICAL INSTITUTE.

THE programme for July 25 included visits to Conisborough Castle, Roche Abbey and Tickhill Castle, which are all found in a picturesque district.

Conisborough Castle.

This castle is described in one of the last chapters of "Ivanhoe," when it was visited by Richard I., Ivanhoe, Gurth and Wamba. Scott, like all men of genius, had realised the principle of evolution, and that archaeology was one of its expositors. In his remarks on the building he said:—"I have always thought that one of the most curious and valuable objects of antiquaries has been to trace the progress of society, by the efforts made in early ages to improve the rudeness of their first expedients until they either approach excellence or, as is most frequently the case, are supplanted by new and fundamental discoveries, which supersede both the earlier and ruder system and the improvements which have been engrafted upon it." The Saxon part of Conisborough he regarded as a step in advance of the early architecture of the Northmen. At the visit of the Institute Mr. St. John Hope explained how William de Warrene was presented with estates, including that site, by the Conqueror, and how the mound was partly, if not wholly, of made ground. The earlier outer fortifications would be of wood until the hill had consolidated, and then would be put up the stonework, followed by the tower. The castle was erected to control the main road and the passage of the Don at the bottom of the hill, and the hill occupied a considerable space, giving room for a considerable number of people. The precise date of the castle they did not know, for being a private possession (not of the Crown), there were no records, but if they compared it with the tower at Orford, they would find a very great resemblance. The date of Orford, as it was a royal castle, could be fixed, and it was 1165-70, so that the work at Conisborough pointed very clearly to its being a tower of the same date. As at Middleham, there had existed a pigeon-house, and high in the walls were to be seen the holes through which they passed. Mr. St. John Hope subsequently conducted the archaeologists over the interior of the keep. Some made the ascent to the top, and the day being beautifully fine and clear, they enjoyed the extensive woodland views. The chapel was regarded with interest, as it was the room in which the monks and maidens were singing requiems for the soul of the Saxon Athelstane at the very moment of the hero himself reappearing in body to the astonished company in the adjoining room, to preside at his own funeral feast, and to "do his guests reason in a cup of wine," and a morsel of savoury ham.

Sir Henry Howorth remarked that Sir Walter Scott's description of that particular castle was the finest account in the English language of how such a castle would have appeared. Geoffrey of Monmouth, the father of English romance, had an extraordinary story of that site, that one of the mounds was the grave of the Jutish chief Hengist.

Roche Abbey.

A pleasant drive of five or six miles transferred the party to the sylvan vicinity of Roche Abbey, past the extensive park, with its fine timber and herds of deer, Sandbeck, the residence

of the Earl of Scarborough, to whom all archaeologists and antiquaries are indebted for the care which is taken of the noble ruins, and for the excavations which, commenced some years ago, are still being made, and whereby much has been revealed that was before hidden under rubbish heaps. The beautiful situation of the abbey, nestling in the base of a wooded dell at the confluence of two streams, was as solitary as even the rigorous Cistercians could desire, and the general scene reminded one of Fountains. The precincts of the abbey are approached by a vaulted gateway of two aisles, with a room above it, but besides the ground plan and the bases of the walls and pillars of the nave there remain only the entrance gate and the nave of the church, Early English, and the piers of the tower. Mr. Harold Brakspear, F.S.A., in a short address, said the abbey was one of the finest examples of the period. It was founded in 1147, twelve monks from Durham, after wandering about, settling down in that rocky place, they getting the ear of the lord of the manor of Maltby that whosoever land it was built upon they should be still joint founders. In 1343 the Earl of Surrey, admiring the beauty of the structure, gave them one of the churches in the neighbourhood. Matilda, Countess of Cambridge, in 1440, who had her principal residence at Conisborough, wished to be buried in the Abbey of Roche "in the chapel of the Blessed Mary, before her image in the south part of the church of the monastery, and I will that a stone of alabaster may lie above my grave, raised up like a tomb, with an image, the fashion of which I leave to my executors." Of that tomb nothing had been found. The abbey was suppressed in 1539, and was allowed to go to ruin in the usual way, being used as a quarry for the neighbourhood, and then "Capability Brown" came into those parts and promptly levelled down the abbey, leaving only those masses of ruins. It was hoped to complete the excavations as far as the main buildings were concerned before long. It was a very good example of a Cistercian church, consisting of a presbytery, transept, two chapels and a nave with eight bays. The block of the high altar still remained. The north wall of the presbytery was magnificent fourteenth-century work, and in the nave were tombstones of a late date. In the floor was a very fine example of a floor drain. Its purpose was not clear, but it had been suggested that it was to take away holy water.

Sir Henry Howorth quoted a passage from Horace Walpole's memoirs, in which he referred to a visit he paid to Roche Abbey in 1772. Walpole said, "This heap is in such a venerable chasm that it might be concealed even from a squire parson. Lord Scarborough neglects it as much as if he was afraid of ghosts."

M. Camille-Eulart, director of the Museum of Comparative Sculpture at the Trocadéro, Paris, spoke of the universal character of Cistercian abbeys wherever they were found, in Germany, Italy, France, or Great Britain, and he had been specially struck by the resemblance of the photographs of that abbey to certain Cistercian abbeys in the Alps. He referred to the mode of life and the habits of the Cistercians who generally built in a valley near a stream, and engaged in agriculture and worked their mill by the stream. The provided an infirmary for old or sick monks, which was always an important part of a Cistercian abbey, but was always apart from it.

Mr. Brakspear pointed out the wall bases, and showed where the fireplaces had been, and said the infirmary was on the other side of the stream.

Tickhill Castle.

Situate on a mound now enclosed by the gardens of an old residence also owned by Lord Scarborough, access to Tickhill Castle is gained by an ancient gateway, fourteenth century, forming the entrance on the western side, which is the most curious part of the ruins. Little now remains of the castle except the lofty mound on which the keep stood, with the ditch and part of the wall surrounding the fortress. Such as the castle then was, it was held for Prince John during his treacherous revolt in 1194 against the absent Cœur de Lion. John in his reign often made it his headquarters.

Mr. W. H. St. John Hope, in describing the castle, said the gateway was of earlier date than the curtain wall and date from the other side of 1100, and the only similar gate he knew was that at Exeter, which was of the time of the Conqueror. The castle was encircled by a large ditch, which was one of those rare examples of a moat that was more or less filled with water. He mentioned some old accounts for such sums as 60 (then a large amount) for stonework in the twelfth century. The gateway was noteworthy for a curious design outside, and there was a large chamber above, with a fourteenth-century fireplace. The large window there was of the time of Elizabeth. Leland had described the castle as "well ditched, the donjon being the fairest part."

Sir Henry Howorth gave expression of the obligation the party were under to the Earl of Scarborough, and all the returned to York.

A Carthusian Monastery.

The excursion on Monday, July 27, was to the Carthusian Monastery of Mount Grace. This property a year or two ago passed into the hands of Sir Isaac Lowthian Bell, and he is now having part of it restored. The work is being executed with great regard to historical accuracy, and in this connection he is having the expert assistance of Mr. St. John Hope. Sir Lowthian has deservedly received the thanks of the archaeologists of the country for his public spirited enterprise. A portion of the Priory was restored in 1901, and is now occupied by his son-in-law and daughter, Mr. and Mrs. Lyulph Stanley. Mr. Micklethwaite, who prepared a paper some time ago for the Yorkshire Archaeological Society, read it before the company immediately on arrival. He prefaced it with a few remarks, and, according to these, the Charterhouse which was founded in 1396 by John de Holland, half-brother to Richard II., is about the finest example in England, if not in Europe, of a Carthusian house. The monks who inhabited it were different from what he termed the ordinary monks, whose houses they had already visited. These monks lived almost entirely for worship, having apparently a belief that they must give their whole lives up to religion if they intended saving their own souls. They each had a cell to themselves, and lived entirely apart from one another. The cells or houses were divided into four rooms, one a work-room in which the occupant could take some kind of bodily exercise which was necessary. Then there was a room with a fireplace, which was used as a dwelling-room, and in this they received their visitors. Another room was a private one, and no one entered it except the occupant himself, and this was a chapel where the monk, when not at the services in the church, could make his own devotional exercises. A fourth place consisted of a study or oratory. A strange feature about the cells was the arrangement by which the food was passed into the monks through an aperture in the wall, and this was so constructed that the person who brought the food could not see the occupant, and *vice versa*.

Mr. Micklethwaite, after these opening remarks, proceeded to read his paper, which dealt with the various tests and stages a candidate must pass before being admitted to the order. The dress of a Carthusian monk consisted of a frock or tunic made of white wool, with a belt of white leather, from which hung beads. Besides the monks of the choir, there are two other classes in the order, the "Conversi" and the "Donati." The former had existed from the first. Two of the six who were with St. Bruno when he entered the wilderness of Chartreux were not lettered men, and so could not take their part in the services by which the others strove to serve God. But they could contribute to the same end by undertaking the secular work of the community, thereby leaving the monks free to devote themselves to spiritual exercises without the distraction of worldly cares. The Donati engaged themselves to remain in the monastery only for a time, and their dress distinguished them. It took a man eleven years from his first entering a monastery before he became a permanent member. Every charterhouse was a kingdom to itself, and the prior was the head, but the affairs of the whole order were regulated by a general chapter, at which every prior had a seat. The prior had nothing to distinguish him from the others, and as far as possible led the same life as they did. He had a deputy called the vicar, and the secular business of the house was in the hands of an officer called the procurator. The life of the Carthusian monk lived was not so unvaried as some might think. The paper went on to describe the daily routine of the life of a monk. For the greater part of the year they took only one meal a day, and in the evening a morsel of bread with little wine. On Feast days they dined together, but silence was always observed. There was no flesh meat eaten, it being forbidden by the General Chapter in 1244. In order that the Carthusian monks might not lose the advantage of mutual intercourse, a time was set apart on Sundays and chapter days, when they might meet for conversation, and once each week the fathers took a walk out together. That lasted about three hours, and during that time all conversed freely. Mr. Micklethwaite told a story in this connection which is worth repeating. Once a pope wished to relax the Carthusian rule because of its hardness, and the monks sent to him a deputation of twenty-seven of their own body, the youngest of whom was eighty-eight and the others from that up to ninety-five, and thus convinced him that the rule did not shorten life.

Mr. St. John Hope took the company round the ruins and explained the plan on which the priory was laid out. There is a large cloister or court, with the priory church in the centre and with the cells of the monks pointing into it. A chapter-house had been subsequently added, and also two very small in-septs and a lady chapel. He also described the cells of the monks. In the gardens attached to these they used to exercise by the cultivation of flowers, fruit and vegetables, and occasionally some of the monks would go into the fields to work, but it was difficult for them to do that and preserve the solitary life which was a feature of the Carthusian monk.

Sir Henry Howorth presided over the business meeting. The question of where next year's gathering should be held came up for discussion. Amongst the places suggested were Bath, Bristol, Worcester, Ireland and Normandy. It was decided to submit these suggestions to the Council. Votes of thanks were then passed to Sir George Armytage for his services as president of the meeting, and also to the Lord Mayor and Lady Mayoress of York, the local committee and secretaries, and to all who had in any way contributed to the success of the meeting. The Chairman also referred to the presence of the French delegates, and in according to them a very hearty welcome, said the English archaeologist possessed an advantage over their French brethren in the continuity of history.

Mr. Micklethwaite seconded, and said that archaeology was tending to widen the study of arts and especially that of architecture. It was a movement which took in the whole civilised world, and in architecture the civilised world meant the old Roman Empire. It was not local or national, but a much wider and complete study of archaeology than could be confined to that country. He recognised with gratification the growing interest which the French and Italian archaeologists were displaying in English architecture and antiquities.

The President remarked that the presence of the French delegates made them realise what an awful catastrophe the Tower of Babel was.

The report is derived from the *Yorkshire Herald*.

BUILDING CONSTRUCTION FROM A FIRE BRIGADE OFFICER'S POINT OF VIEW.*

IN taking up as my subject "Building Construction from a Fire-Brigade Officer's Point of View," I have clearly before me the fact that most architects and builders are fully alive to the necessity of fire-resisting construction, and that legislative and local enactments make stipulations and recommendations with the view of preventing destruction by fire. Such efforts are worthy of praise; but my experience in combating fire leads me to the conclusion that what is intended as a safeguard too often becomes a danger, and what is theoretically meant for strength is found in the hour of need a source of weakness.

I do not presume to dictate, but I feel it my duty to sound a note of warning regarding certain widely spread and much cherished convictions as to fire-resisting materials employed in public buildings.

Speaking as I do under the auspices of the Fire Prevention Committee, I address myself more particularly to those who are responsible for the construction of buildings, but I appeal also to those of my colleagues who are responsible for dealing with buildings after the fire has begun its work. The question of the general arrangement or architectural planning of buildings does not enter into my argument; what I propose to deal with is the type of building usually described as being constructed entirely "fireproof," and to offer from my practical everyday experience suggestions which may perhaps induce building constructors to reconsider certain accepted theories in connection with so-called "fireproof" materials.

From the fireman's point of view these "fireproof" buildings have an element of danger added because of their construction, both in the way of increased risk to the fire brigade and the destruction of property. If such buildings were to remain unoccupied and to be subject to no risk beyond the combustibility of their own non-inflammable construction, then certainly they could with propriety be described as "fireproof." But when (as is universally the case) such buildings are stored with goods readily inflammable, the buildings cease to be "fireproof," for the action of the fire plays havoc with that portion of the material which is theoretically "fireproof."

Sufficient attention has not been paid to the bearing these so-called "fireproof" materials have in relation to the calorific effects of the burning materials stored in the buildings, for, after all, it is the contents rather than the structure which in a large majority of cases commence to burn, and which will continue to burn, no matter in what kind of building they are stored. Sufficient attention has also not been paid to the effect of water applied to building materials after they have been subjected to extreme heat.

How do these "fireproof" materials assist the salvage of either the buildings or their contents? Do they assist entrance with safety to those combating the fire?

On each of these points I shall endeavour to prove a negative from my own personal experience, which I feel confident is not singular but is common to the fire profession.

Materials principally considered to be "fireproof" and which are so styled by the legislative acts are iron, concrete and stone. The latter is particularly mentioned in most acts

* A paper prepared for the International Fire Prevention Congress by Mr. Arthur Fordage, firemaster of Edinburgh.

as "stone or other fireproof material." We have to ask ourselves whether these materials are "fireproof"? When employed in the internal fittings of a building we may unquestionably give a decided negative to that question. My decided opinion is that the materials which meet the requirements are those which are not subject to the laws of expansion and contraction when suddenly exposed to the effects of heat. What are such materials? If we may take for our guidance the results of the tests of time we find them principally in timber, bricks, mortar and good plaster.

Floors and Ceilings.

It is the common experience of every fireman that an ordinary wood floor with a thin plaster ceiling underneath has stood the effects of a fire for probably an hour, and though burned through in places still remained in position and with sufficient stability left in the joisting to admit of the fireman passing over it in the course of his operations in extinguishing the fire. If such a floor survives the effects of fire with its slender remains still in position, how much better would a well-constructed wood floor resist the effects of fire under similar conditions. No extraordinary precautions are necessary to construct such a floor, but I suggest that the ends of the joists should be well bedded in the walls, flooring boards of not less than 1 inch thick be well tongued together, the spaces between the joisting be filled with pugging or other deafening, the underside or ceiling coated with 1 inch of good plaster on wire laths. Such a floor will resist a fire either from the top or underside sufficiently long to enable any ordinary fire brigade plenty of time to complete their toilet before turning out and arrive in time to do some good work and prevent the floors from collapsing. Where supports are required, owing to the large superficial area of floor space, built timber supports or columns have been known to remain in position and to serve the purpose a second time after having resisted the effects of a severe fire. If these wood posts or columns are wire lathed and coated with good plaster and treated in a manner similar to that often adopted with iron columns they would come out practically unscathed. It will perhaps be argued that this method by no means gets rid of the difficulty with large spans, where iron must of necessity be introduced, but in such cases wrought-iron columns and girders (well protected) should be used to carry wood flooring and joisting, which latter, being impervious to the effects of heat and cold, remain in position, whereas the concrete floor falls in sections and often wrecks the lower floors which would otherwise not have been affected by the fire. I have known it to be argued that the burning of a wood floor gives off so much smoke that the inmates of a building would be suffocated before being reached. To properly understand this point it is necessary to compare the results of fire on both classes of flooring. We must remember that a partly burnt but intact wood floor always affords a means of reaching the inmates, and that before the floor surface commences to burn the fire must have been very severe and the contents of the apartment would almost certainly have been involved. It frequently happens that the flooring in "fireproof" buildings begins to break away at the early stages of a fire, preventing the fireman entering to attack it, with the result that the operations must necessarily be conducted from the outside, thus giving the fire a chance to make some headway. On the other hand, when the water can be got on to the wood floor and supports, there is the possibility of keeping the floor intact.

I will specify a few instances in support of my contentions. The first instance is that of a fire on a carriage-builder's premises of five floors, which were built upon fireproof principles, the floors consisting of transverse 24-inch plated girders and floors of 9 inches of concrete, without protection on either side. The fire commenced in the paint-shop on the ground floor (a chamber built expressly for the purpose and having no communication with the upper floors). Upon the arrival of the brigade it was possible to see that one end each of the first and second floors was gone, and that the vehicles on the third floor were alight. The upper windows were blown out, and immediately the cold air and water got on to the third floor, the whole of this floor went down by the run, carrying everything through the building to the basement. As a result only a portion of the top floor remained; the iron girders were somewhat twisted, though not displaced, but the concrete collapsed and fell, leaving nothing but the bare walls. The firemen could not be sent into this building. Had the upper floors been of wood they would undoubtedly have been saved.

The second instance is that of a fire on the second floor of a five-storey warehouse built on a similar principle, wherein the third-floor sections of concrete fell whilst the firemen were directing the hose upon the second floor, with the result that its weight carried the second and first floors through into the basement. This fire would have been stopped on the second floor but for the collapse of the floors above.

The third instance is an illustration in favour of timber floors. At a riverside warehouse in the City of London I

attended three fires on the same premises in three successive years. The first two were serious outbreaks, but I noticed on the last two occasions that the same wooden uprights still supported the floors, and many of the exposed wood joists bore evidence of their reliability on their charred surfaces.

Partitions.

I now come to the question of partitions. The reliability of partitions between the different sections and rooms of a building, whether dwelling-house or warehouse, to resist fire, is of the utmost importance, and often determines the fate of the building. The progress of a fire is often regulated by the area of the compartment in which it originates and the internal partitions; therefore much depends upon the time during which the latter remains intact. The wooden lath-and-plaster partition may be immediately thrown off court, the light laths with rough edges and the space between being a ready conductor of fire from one part of the building to the other. Internal partitions should be solid, preferably of brick, and continued right through the building, the joisting at the different floors running through them, so that they practically form an internal wall from the basement to the roof. The advantages of such a partition would be many, apart from being a factor in fire prevention.

Stairs.

Great stress is laid upon the idea of employing stone for staircases as a safe and reliable exit for a large number of persons from a building on fire. This is a very good principle under certain conditions, and these are that a stone stair should be built in a well, apart from the general building and in such a manner that fire or heat cannot possibly get at the underside of the stair. Where a staircase must necessarily run through a building, stone or concrete should be avoided in its construction, but good solid wood (hard wood by preference) is the most reliable under all circumstances. If the underside of the treads be filled in with "deafening" and coated with good plaster, such a stair will remain in position during the progress of a fire long after it has been impossible for an human being to traverse it. If the stair should actually get alight, and the fire fed by an open door should even cause it to burn fiercely, so soon as the hose is applied by the fire brigade the fire will be almost immediately extinguished because the actual burning is only superficial and there will remain sufficient substance to admit of persons passing over the stair.

It may be argued that a stone stair would not take fire at all, and therefore would always remain passable, but every fireman knows that when there is sufficient heat and flame to ignite the wooden structure of a hard-wood staircase it is quite impossible for anyone to pass either up or down a stone stair under similar circumstances.

In my preference for wood in the construction of stairs specially exclude light and flimsy wooden flights of stairs which are so very frequently found in some dwelling-houses, warehouses, &c., and the wooden step ladder almost invariably found in factories. I speak of a well-built staircase with hard wood treads and facings, the underside filled in with deafening and coated with plaster.

Stone, as employed in stairs in ordinary buildings, cannot in any sense of the word be considered to be "fireproof" because it succumbs to the effects of heat and fire more readily than any other material employed in the construction of buildings. That portion of the stone tread which is exposed to the fire readily expands under its influence, whilst the ends, which are embedded in the wall, remain normal, the natural consequence being a fracture near the wall, and the collapse of the projecting portion.

I am continually told in Scotland that the reason so many lives are lost at fires in London is on account of wooden staircases and that there is less loss of life in Scotland owing to the almost universal practice of putting in stone stairs.

Having had considerable experience at fires in both countries I am in a position to say that the idea is entirely erroneous. Most of the lives lost at London fires are at small fires in small dwellings, and in the majority of cases in dwelling-houses situated over shops, where the access to the house is through the shop, thence by a very frail, unprotected and flimsy wooden staircase. When the shop takes fire the exit from the house is immediately cut off by the fire and smoke rushing up the staircase. The same conditions apply to the ordinary London dwelling-house, which is let out to a large number of families: the open staircase runs from the street door through the interior of the house, and every room opens on to it, and escape by this stair is cut off by the first rush of smoke or flame. The system which is almost universal throughout Scotland is very different.

Take a block of buildings consisting of shops with flats above: there is no communication between the shops and the houses. The proprietor of the shop does not necessarily live above it; in the majority of cases he lives in another part of the town. What are the circumstances when a fire takes place in one of the shops? It may be burned out, but given the

the ceiling is fairly good and the fire brigade receives a good all, the fire will rarely pass the boards which support the 4 or inches of deafening which is universal in Scottish buildings, and forms a splendid barrier to the fire.

The approach to the houses above being by a stair-well, quite apart from any connection with the business portion of the block, does not allow the fire to be communicated to the dwellings by the stair-well, for in order to do so it must first pass through the wall dividing the stair from the shop. It rarely happens that a shop fire in tenement blocks spreads to the house immediately above, and when it does, the inmates of the house have had time to escape by the independent staircase.

By way of justifying these contentions in relation to stone stairs, I recall a few instances observed at buildings after fires:—

At a fire in a large suite of offices with a spacious stone staircase some 6 feet wide, waste paper stored in the cupboard space under the stair leading from the ground to the first floor caught fire and was destroyed; a bucket of water was capsized over the stairs, and the whole flight immediately collapsed, scarcely leaving a fragment in the wall to indicate where the stone had been, whilst the thin wooden panelled door enclosing the cupboard remained intact, with the exception of the charring on the inside.

At a fire in a large music warehouse an unprotected and hastily constructed wooden stair led from the basement to the ground floor, terminating on a stone slab 5 feet square and 4 inches thick, from which a handsome wooden stair led up to the first floor show-rooms. The fire originated in the basement, and flowed up over the stairs to the first floor. When the fire was extinguished, both wooden stairs, which had been exposed to the full effects of the fire, were found much damaged, but sufficiently substantial to admit of the passage of the firemen; the stone landing had collapsed into a thousand fragments.

Still another instance of the unreliability of stone for a staircase. At a fire in a fine old mansion-house which was partially destroyed, the stairs in the end wings were of stone from the basement to the second floor, whilst those from the second to the third floor and from the latter to the roof were of white wood with wooden hand-rails. Practically no actual flame got to the staircase, but the heat passed up the stair-well, with the result that the whole of the stone stair collapsed, leaving heavy jagged ends projecting from the masonry, while the wooden stairs, where by far the greatest temperature must have been, were merely blistered and scorched.

Iron Stairs.

It has been equally demonstrated that iron, and especially cast-iron, is utterly unreliable under the influences of fire; whilst wrought-iron will buckle and twist itself out of position, and cast-iron will collapse entirely. I give an instance which very recently came under my notice at a fire in a manufacturing iron-works warehouse. The offices were situated on the first floor, to which a cast-iron spiral staircase had been erected in a specially constructed well as a safety exit for the office staff. The fire originated on the ground floor. At the first alarm several of the office staff made for the iron stair, but only a few were able to get down this stair, the others were cut off by the very first flow of flame and were rescued from the flames below. The fire was speedily extinguished near this point, but the whole stair collapsed within ten minutes of the outbreak.

Roofs.

The matter of the general arrangement of roofs deserves to receive more serious attention than is usually given to this most important part of the modern building. Unfortunately a fire preventive roof does not appeal to the artistic eye, especially in the modern country-houses, where the old English style of architecture with its long sloping gables has found so much favour of recent years. These high roofs admit of the fire running all over the building, and their construction prevents a fire being attacked from the outside until a hole has been burned through the roof. In all buildings where fire prevention is aimed at the division walls should be carried at least 4 or 5 feet through the roof, with a ledging of at least 6 inches round the edge, which would admit of men working on it in case of fire. Such a ledging affords a ready means of saving life and attacking a fire.

The roof is one portion of a building where iron may be employed with advantage by reason of the light weight which it has and the necessarily exposed condition of its construction. A lightly constructed trussed iron roof reduces the risk of fire originating and spreading in the roof to a minimum. The opinions I have expressed in this paper are facts well known to the fire service and recognised by some architects, and are worthy of most serious attention by the building profession generally. There are many points in building construction which are continually presenting themselves to the architect, but which the architect rarely sees, and has therefore no opportunity of studying, and these points when advocated,

being so foreign to accepted ideas, are naturally very adversely received and criticised by the building profession.

As a case in point, some time ago whilst in conversation with the authorities responsible for an important historical building, I suggested that certain additional precautions should be taken from a fire-prevention point of view, and as a precautionary measure in dealing with a possible outbreak. I knew there were very bad risks, especially in the roof, which I pointed out, but was told that the building was perfectly safe, the roof was not an old one, it had been renewed not more than forty years ago, and that iron doors had been put in to divide the different sections of the building. Now every fireman knows that a long continuous roof which exposes a forest of unprotected and rough-edged and dried timber is a very dangerous risk; also that iron doors have long proved a failure as a protection against the spread of fire, and that they are inferior to a solid heavy wooden door which remains in position long after the iron door has buckled out of its frame and ceased to fill up the opening.

Whether or not I have made my meaning clear or overstated my views, I think you will at least agree that the subject is one of more than passing importance, and that an exchange of views and experience is most desirable. To prevent possible misunderstanding I desire to say in conclusion that while advocating the more general employment of timber in buildings, I do not include in this category the light pine and deal stairways, thin wooden doors and matchboard-lining partitions, but the employment of substantial timber well protected where possible, and of course the avoidance of all exposed edges.

The conclusion I have arrived at after much observation during a long experience of fires in London and Edinburgh is that "fireproof" construction as generally understood is a source of danger; that wherever possible good timber flooring, supports and stairways should be employed together with brick partitions; a liberal application of plaster and an avoidance of air spaces would result in a lesser destruction of buildings by fire, insure easier manipulation of fire appliances and a more effective use of the same, and result in a greater salvage of property during the progress of fires.

In a word, I advocate the study and use of fire-retarding, rather than non-combustible, materials as the direction in which safety and fire protection may more certainly be found; whilst where the more modern forms of planning necessitate provision for big spans and very heavy loads, the systems of construction now erroneously termed "fireproof" must be so protected as to become fire-resisting.

SCULPTURE AT ST. GEORGE'S HALL.

THE finance committee have recommended the City Council of Liverpool to engage Mr T. Stirling Lee to execute twelve figures above the panels on the front side of St George's Hall. Mr. Lee has written to Alderman Oakshott, explaining the need for the work and the exact nature of his proposals. He expresses the opinion that the time has arrived when the committee should consider the subject of the completion, or at any rate the continuation of the whole scheme of the sculpture. How few public buildings in England, he asks, are complete? Nearly all cities seem alike unconscious or indifferent to the vacant places left by the architect for decoration. This is particularly so on seeing St. George's Hall from Lime Street, the vacant pedestals, the bases waiting for their figures, and the uncarved stone all crying out for their enrichment before Elmes's grand hall can be called complete. An artist will at once ask, Why are not the figures placed over the carved panels? Why are not those essential figures of light placed to break up the deep shadow of the screen formed by the pilasters? The figures, he points out, form part of the original scheme already twice sanctioned by the whole Council. The first series of panels was devoted to the subject of the "Growth of Justice," and the figures above were connected with them both by subject and design, the panels forming bases for the figures above. The second series represented the growth of Liverpool from a fishing village to a city. The material to be used for these figures should, in Mr. Lee's opinion, be that in which the panels are carved—Istrian marble—some of which have now been placed nearly twenty years, and show no sign of weathering, but have, on examination, got a polish on the stone. These figures should be 8 feet 6 inches high, and are so important that they should be personal work, so that a sculptor will have to work continuously, and do little else, to finish two in one year. The whole twelve figures will take six years, or nearly so, to finish. The cost of these twelve figures would be 500*l*. each, or total 6,000*l*.; but the work taking six years to execute, the cost would be spread over that period of time, so that the annual cost to the Corporation would only be 1,000*l*. a year. This, he considers, would be the best method to finish St. George's Hall according to Elmes's design, when Liverpool will have the grandest modern building in Europe.

MANCHESTER REFERENCE LIBRARY.

THE deputy town clerk of the Manchester City Council has reported to the public free libraries committee that the terms of the proposed agreement for sale of the reference library building have been arranged with the solicitor of the purchaser—Lloyds Bank, Limited. The purchase money is ascertained to be 161,415*l*. The building area is 1,494½ square yards, which will be subject to adjustment, if necessary, when the buildings are removed. The amount of the purchase money is arrived at by taking the stated area at 110*l*. per square yard, and deducting the chief rent of 110*l*. 7*s*. 6*d*. at twenty-seven years' purchase. The purchaser agrees to pay 25,000*l*. by way of deposit on the execution of the contract. Possession is to be delivered and conveyance executed at the expiration of six calendar months after written notice to that effect given by the Corporation to the purchaser, such notice not to be given before September 25, 1908, and not later than September 25, 1912. If no such notice be given possession is to be delivered and completion is to take place on March 25, 1913. Notwithstanding the last-mentioned provision, the purchaser is to have the option of taking possession of the vacant land fronting Cross Street, on terms as to payment of a proportionate amount of the purchase money, and otherwise, to be agreed on between the parties. The Corporation are to pay interest at 3*l*. 7*s*. 6*d*. per cent. per annum upon the deposit of 25,000*l*., such interest to be paid half-yearly on September 29 and March 25 in each year. The sale includes all buildings and erections, but the Corporation will have the right to remove all statuary (whether within or outside the buildings), lamps, ornaments, medallions, book-cases, pictures, books, furniture, fixtures and fittings generally, whether fixed to the freehold or not. The sale is subject to the yearly chief rent of 110*l*. 7*s*. 6*d*., and to the covenants and conditions contained in certain deeds dated March 24, 1804, and November 26, 1897. The Corporation, if required by the purchaser, are to execute one or more conveyances of the property when the completion of the sale takes place and the whole of the purchase money is paid. The agreement contains a provision for enabling the purchaser within twelve months after completion of the sale to remove and appropriate the buildings and erections upon the strips of land lying between the land sold and the streets, with power to the Corporation to themselves remove at the cost of the purchaser on the purchaser's neglect to do so.

The committee are requested to authorise the affixing of the corporate seal to the agreement, and also to the necessary memorial to the Local Government Board for their sanction to the sale.

THE SURVEYORS' INSTITUTION.

THE thirty-fifth annual report of the Surveyors' Institution shows that the members of that thriving organisation now number 3,443, representing an increase of 131 on the year. The total comprises 1,897 Fellows, 1,025 professional associates, 86 associates, 396 students, 22 colonial Fellows and 17 honorary members. Ten years ago the membership numbered 2,269 and twenty years ago it was only 887. The finances continue in a satisfactory condition, the revenue of the year having admitted of the investment of 2,000*l*. and the assets now stand at over 26,000*l*. The number of candidates who sat for the professional examinations was 424; the examinations were held in London, Manchester, Glasgow and Dublin. The Council acknowledge a munificent act on the part of one of their colleagues, Mr. F. T. Galsworthy, who has transferred to the Institution 500*l*. of 3½ per cent. debenture stock, calculated to yield 17*l*. 10*s*. per annum, the interest to be awarded annually as a prize in connection with the Fellowship examination in a form to be hereafter determined. Considerable additions have been made to the library of the Institution and a loan library has been established for the benefit of country members who may wish to borrow professional text-books and works of reference. Three years having elapsed since the completion of the new house of the Institution in Great George Street, Westminster, the more permanent decoration of the principal rooms has now been carried out. The Irish members of the Institution, whose vocation is threatened with extinction under the operation of the new Land Purchase Bill should it become law, appealed to the Council to assist them in safeguarding their interests by every means in their power. The Council, with this object, endeavoured to induce the Chief Secretary to receive a deputation from their body in the hope of prevailing upon him to introduce protective provisions into the draft Bill. Failing this they have done their best by the exercise of influence in Parliament and in other ways to secure something like justice to a class who have contributed so largely in past years to the maintenance of law and order in Ireland, and whose vital interests are menaced by the direct intervention of the State. During the year steps have been taken by the Institution, in

conjunction with nearly all the other chartered societies, for the protection of their respective designatory letters and descriptions against infringement by unscrupulous persons. Happily the evil is not very widespread, but it is extremely desirable to devise a means whereby these practices may be stopped or greatly discouraged, and a deputation, selected from a committee representative of all the chartered societies, has approached the authorities with a view to such repressive measures as may prove to be practicable. Finally, it is stated that the Institution continues on a course of unabated prosperity, and that the auguries as regards the future seem to give every promise of its increasing usefulness to the profession.

TESSERÆ.

"Values" in Painting.

A COLOUR note, or tone, may be considered from two points of view; from that of its intensity or tint, or from its affinity to white light or value. This is one of the most delicate points in the management of light and shade. It is easy enough to see, for instance, that bright yellow has more value than violet; but such discernment becomes infinitely more difficult when we have to deal with the broken and subdued colours more commonly employed by painters. Complications sometimes arise which baffle the most subtle analysis. Can it be considered waste of time to take so much trouble to understand distinctions which are, in truth, almost imperceptible? Of course, the inquiry would have but slight importance for the general public; yet any violation of these subtle and almost indemonstrable laws is sufficient to deprive a picture of part of its charm and to distress the delicate eye of a true connoisseur. The connoisseur, probably, might not be able to lay his finger upon the exact cause of his discomfiture, but it would be not the less real. The eye, like the ear, is the seat of the most strangely delicate refinements. When we reflect that to give pain to a practised ear it is enough to deprive a note of a very few of the many million vibrations a second which go to make up its proper sound, we can feel no surprise that the eye should be an equal sufferer by a very small mistake in the value of a colour note. It is obvious, however, that the ear of the musician does not count the 4,200 vibrations of which the high *re* of the piccolo is composed. Nevertheless, when the total is not correct the result is suffering sufficient to destroy the pleasure of a whole performance. The same thing exactly takes place in painting, although we do not understand its laws with equal accuracy. But in scientific ignorance does not affect the sensibility of our organs, although it may embarrass the critic when he endeavours to give reasons for the shortcomings of which he is conscious.

Circular Exhibition Galleries.

The Colosseum in Regent's Park, which used to be one of the sights of London, contained among its novelties a circular gallery for the exhibition of sculpture which was known as the Glyptotheca. There was a peristyle of twenty columns of the Ionic order, and as many recesses within the colonnade answering to the number of intercolumns, except that in those spaces, one on the east, the other on the west side, were made use of for entrances. The whole was lighted from above through the compartments (filled in with cut-glass) between the ribs of the roof, which last, instead of expanding itself into a dome, became merely a cove in consequence of the cylindrical mass in the centre of the plan, and which might be considered the core of the structure, rising up through what would otherwise be a dome covering the entire space. In like manner, were provided for that cylinder within it, this interior would be merely a rotunda of the usual kind, whereas now it was converted into one of altogether different character, though no doubt not without any view at all in the first instance to architectural character or effect of any kind, but solely in consequence of the indispensable necessity of carrying up a staircase in the very centre of the building to the platform which the panorama was viewed from. It was accordingly sheer necessity which originally compelled the architect to adopt a peculiarity of plan that was admirably turned to account. Besides being unusually attractive for its architectural beauty, this gallery was excellently well contrived for the exhibition of either sculpture or pictures; because, though the peristyle was circular, the wall behind it might be a polygon of as many planes as there were intercolumns, in this instance twenty, and by being so divided into separate compartments or groups pictures could be arranged better with regard to some sort of classification than when hung upon the side of a long wall without distinction of any kind from end to end. The convex part of such a double cylindrical plan might in like manner be rendered available for hanging pictures—were such the purpose of the gallery—by making that also a circle of columns, the centre being in this case engaged or attached to the wall, which would consist of as many separate planes or flat surfaces

intercolumns, and in order to keep up perfect symmetry in regard to intercolumniation the two circles might be so proportioned to each other that the larger or outer circle would have twice the number of the columns on the circumference of the smaller circle or cylinder, the intercolumns being of the same width in both circles. This would, of course, very greatly increase the diameter of the cylinder, to somewhat more than half that of the larger circle; consequently, supposing the breadth of the gallery or space between the two concentric circles of the plan to be the same as in the Cryptotheca of the Colosseum, the whole plan would be greatly enlarged, and there might be a rotunda 50 feet in diameter in the centre of it; so that in a gallery thus planned the ring or outer portion could be appropriated to pictures and the inner one form a circular hall for sculpture. Thus the arrangement of plan being just the same as at the Colosseum, the architectural character of the structure would become different, inasmuch as by being increased in circumference the ring would acquire more of the appearance of a gallery, and in some degree lose that of a rotunda with another structure put up in the centre of it. The same general disposition of plan—and it is one that plainly enough shows itself in the concentric circles of Druidical pillars in such monuments as Avebury and Stonehenge—is applicable to a very great variety of cases.

Imagination in Science and Art.

The imagination plays an important part in the fine arts, in mechanical contrivances and in the more concrete branches of physical science. In the creation of works of art the fancy of the poet, painter, sculptor or musician is employed in grouping and combining his materials so as to awaken admiration and satisfaction in the mind. At times his aim will be to hold the mirror up to nature in order to delight by the exquisite skill and fidelity with which he reproduces an actual experience recalled by the memory. At other times he assumes a nobler part and seeks to give expression to some thought embodying an ideal type of beauty or excellence which is never met with in the commonplace world of real life, but is dimly shadowed forth in rare moments by our own imagination. This faculty is said to be rich, fertile or luxuriant when images of great variety issue forth in spontaneous abundance. Taste, on the other hand, implies judicious or refined rather than luxuriant fancy. Great genius in any of the branches of art presupposes fertile imagination, but true excellence is attained only when the power is controlled and directed by good judgment. The importance of imagination in mechanical contrivance and invention is obvious. The power of holding firmly before the mind a clear and distinct representation of the object to be produced is one of the most necessary qualifications of constructive ability. The relations between imagination and science have been the subject of much dispute, some writers holding that a rich and powerful imagination is adverse rather than favourable to scientific excellence, while others consider this to be "as indispensable in the abstract sciences as in the poetical and plastic arts" and that "it may accordingly be reasonably doubted whether Aristotle or Homer were possessed of the more powerful imagination."

The Kaaba, Mecca.

The mosque called Beitullah, or El Haram, is only remarkable for the Kaaba, which it encloses. The Kaaba stands in a long square, surrounded by colonnades; on the east there are four rows of pillars and on the other sides only three. They are united by pointed arches, every four of which support a dome, plastered and whitened on the outside. The number of these domes is 152, and that of the pillars is variously stated at 450 and 500. The columns are from 1½ foot in diameter, and above 20 feet in height, but otherwise there is little regularity in them. No two capitals or shafts are exactly alike. The capitals are of coarse Saracenic workmanship, and some, which had served for other buildings, were by the ignorance of the workmen, been placed upside down upon the shafts. Seven paved causeways lead from the colonnades towards the Kaaba, or Holy House, in the centre. The whole area of the mosque is upon a lower level than any of the streets surrounding it. There is a descent of eight or ten steps from the gates on the north side into the platform of the colonnade, and of three or four steps from the gates on the east side. Towards the middle of this area stands the Kaaba, according to the belief of the Mahomedans, was erected in heaven 2,000 years before the creation of the world, and Adam, the first believer, erected the Kaaba upon its present site, which is exactly below the spot it occupied in heaven. It is an oblong massive structure, 27 feet in length, 14 in breadth and from 35 to 40 feet in height. It is constructed of the grey Mecca stone, in large blocks of different sizes, joined together in a rough manner and with bad cement. It stands upon a base 2 feet in height, which presents a sharp vertical plane. As the roof is flat, it has at a distance the

appearance of a perfect cube. The only door which leads into it is opened only two or three times in the year; this door is on the north side, and about 7 feet above the ground; it is entered by wooden steps. At the north-eastern corner of the Kaaba, near the door, is the famous Black Stone; it forms a part of the sharp angle of the building, and is 4 or 5 feet above the ground. It is an irregular oval about 7 inches in diameter, with an undulating surface, composed of about a dozen smaller stones of different sizes and shapes, well joined together with a small quantity of cement and perfectly smoothed. Every pilgrim kisses this stone. As its surface has been much worn by the kisses and touches of the pious, it is difficult to determine the nature of the stone. It appeared to Burckhardt to be a lava, containing several small extraneous particles of a whitish or of a yellowish substance. The colour is now a deep reddish brown approaching to black. The four sides of the Kaaba are covered with a black silk stuff, hanging down and leaving the roof bare. This covering is renewed annually at the time of the hadj. An opening is left for the black stone. The Kaaba remains without a cover for fifteen days before the new one is put on. The black colour of the covering spread over a large cube in the midst of a vast square gives to the Kaaba, at first sight, a very singular and imposing appearance. As it is fastened slightly, the least breeze causes it to move with a slow undulation which is hailed by the assembled congregation as a sign of the presence of the guardian angels, whose wings by their motion are supposed to produce the waving of the covering. Seventy thousand angels have the Kaaba in their holy care, and are ordered to transport it to Paradise when the trumpet of the last judgment shall be sounded.

"Harrison of Chester."

In his evidence before the Select Committee on the marbles of the Parthenon, Lord Elgin said the idea to obtain the sculpture was suggested to him in 1799, at the period of his nomination to the Embassy at Constantinople, by Mr. Harrison, an architect who was working for him in Scotland, and who had passed the greater part of his life in Rome. His observation was that though the public were in possession of everything required to give them a general knowledge of the remains of Athens, yet they had nothing to convey to artists, particularly to students, that which the actual representation by cast would more effectually give them. Lord Elgin went beyond the suggestion, for instead of casts he brought the originals to England. Thomas Harrison, generally called "Harrison of Chester," to whom Lord Elgin referred, was born at Wakefield in Yorkshire in 1744. While yet little more than a mere lad he was sent to Italy, then considered almost the only efficient school for architectural study; and during his stay at Rome, where he remained for several years, he made designs for improving and embellishing the Piazza del Popolo, which obtained for him both a gold and silver medal from Pope Ganganelli; and he was also complimented by being elected a member of the Academy of St. Luke. On his return one of his first works was a bridge of five arches over the Lune at Lancaster, which was the first level bridge constructed in England, at which place he was subsequently employed upon various alterations and improvements in the castle. At Chester he erected the gaol on the panopticon plan, and the county courts, which last was considered at the time a very fine and correct specimen of the Grecian Doric style, and the portico certainly produced more effect than ordinary in regard to columniation, for though only hexastyle it had twelve columns, there being a second row of six columns behind those in front. He also designed a bridge over the Dee having an arch of 200 feet span. He executed several works at both Liverpool and Manchester; in the former place the Athenæum and the tower of St. Nicholas's Church, in the latter the Exchange buildings (since greatly enlarged and altered), the theatre (burnt down in 1843), and the library and reading-room called the Portico. The Hill column at Shrewsbury, the triumphal arch at Holyhead, and the jubilee tower erected on Moel Famma in commemoration of the fiftieth year of the reign of George III., are all by Harrison. He also built for the Earl of Elgin his new mansion of Broome Hall, in Scotland in the Grecian Doric style, which seems to have been equally the favourite one of his noble employer and himself. Harrison died in Chester in 1829.

The Pasquin Group.

In Venice there was a lion's mouth in which anonymous charges against individuals could be thrown and investigation followed. In Rome there was an ancient but mutilated group of sculpture to which satirical writings of all kinds could be attached. It is believed the group originally represented Menelaus with the body of Patroclus, looking for aid as described at the close of Book XVII. of the "Iliad." There was no apparent connection between such a group and lampoons. But near it was the shop of a tailor named Pasquino, which was a place of meeting for the people of the district, who came there to tell or hear the news of the day.

The tailor was a facetious man, and his witty sayings were styled "Pasquinate," which afterwards became a common appellation for humorous epigrams and sarcastic lampoons, a kind of composition for which the Romans are noted. These lampoons, which often attacked people in high stations and the government itself, were fixed in the night on or near the statue. At one time they were placed on a post, and thus the statue itself came to be called Pasquino, as being the representative of the witty tailor of that name. According to Misson, the statue was found under the pavement of the tailor's shop. Collections of these epigrams have been made, and some of them are very witty, though often scurrilous and coarse. Copies of the group exist in Florence and elsewhere. The humour was increased by employing another statue which was supposed to be one of Mars, and which was called "Marforio." While one was near the Palazzo Braschi, the other stood opposite the Mamertine Prison. As soon as a libel or a jeer was attached to Pasquin, people ran to Marforio, and were disappointed if a reply as witty and probably more libellous was not awaiting them. Sometimes Pasquin was supposed to defend Marforio and *vice versa*. The statue of Marforio is now in the court of the Capitoline Museum, and is taken to be a river god.

GENERAL.

Messrs. William Ravenscroft & Charles Smith are preparing plans for the rebuilding of University College, Reading. Towards the outlay Lady Wantage has given 10,000*l.*, Mr. G. W. Palmer, M.P., 10,000*l.*, and a similar donation has been promised by three gentlemen. The outlay will be at least 80,000*l.*

The Competition for the best scheme for the water supply of Flamborough has resulted in the plans of Messrs. Elliott & Brown, of Nottingham, being adopted. Fourteen schemes were submitted.

In Consequence of the recent fire at Eton, Mr. A. W. Sclater, A.M.I.C.E., 182 Oxford Street, W., has been called in to report as to the safety, from the fire point of view, of the electric-light installations in the different houses in the college.

Mr. W. D. Caröe, M.A., F.S.A., architect to the Ecclesiastical Commissioners, has been admitted to the freedom of the City of London on the presentation of the Plumbers' Company.

Professor Ewing has resigned the Chair of Applied Mechanics at Cambridge University, in view of the important appointment recently conferred on him by the Admiralty.

The Bridge House Estates Committee on Friday last signed a report in favour of a scheme for rebuilding Southwark Bridge at a cost of nearly 350,000*l.* It is proposed to lower the crown of the structure by 7 feet, a work which will in no way impede the navigation on the river, while it will greatly reduce the excessive gradient on the City side.

The Westminster City Council last week resolved "That the City Council do contribute one-fifth of the net cost of carrying out the Piccadilly improvement in accordance with the terms of the letter from His Majesty's Office of Woods, such contribution not to exceed the sum of 40,000*l.*, subject to the same being paid in instalments on the completion of each section of the improvement, each instalment being one-fifth of the cost of acquiring the section to which it refers."

A Detached Building is to be erected at the rear of the County Hall in Lewes, which is to contain committee-rooms, offices and store-rooms, at a cost of 3,200*l.*

A Report is to be prepared about the cost of erecting buildings for an international exhibition to be held in Dublin in 1906. If Lord Pembroke consents the site will be within the Pembroke district, in which the Dublin Society's exhibitions are now held.

Mr. Labouchere's House, No. 5 Old Palace Yard, Westminster, is to be purchased by the Government at a cost of 40,000*l.* under the Public Buildings Bill.

The Ecclesiastical Commissioners propose to demolish the old residential quarter immediately south of Westminster Abbey and Deanery Garden, with a view to selling the sites for important commercial buildings.

Addington Park, the former residence of the Archbishops of Canterbury, was sold for 45,000*l.* With the addition of the amount (2,371*l.* 7*s.*) paid over by the Archbishop in respect of dilapidations accrued before the sale, the total proceeds coming into the hands of the Ecclesiastical Commissioners was 47,371*l.* 7*s.*, which was reduced to 46,026*l.* 18*s.* 11*d.* by the discharge of a small mortgage created in respect of certain improvements at Addington. The cost of the site for the new archiepiscopal palace at Canterbury and the erection of the building has been 29,176*l.* 11*s.* 1*d.*

The Marble Statue of Von Moltke will be placed in the course of next year opposite to the Reichstag, and direct facing the Bismarck statue in Berlin. It will be the work of Professor Uphues.

The P. and R. Syndicate completed last week the purchase of the St. James's Hall Company's properties on the northern side of Piccadilly. The interests acquired are those of St. James's Hall, the Restaurant, Carswell's and the Society Architects' premises, and Nos. 21 and 23 Piccadilly, and portion of 1 Air Street. The purchase is in connection with the approved scheme for the widening of Piccadilly.

Mr. F. Carruthers Gould was last week presented with the honorary freedom of the borough of Barnstaple, where was born, and where his father was borough surveyor. Mr. Gould is the first to receive the honorary freedom, which was conferred on him in recognition of his eminent success as artist and journalist.

The Buller Memorial at Exeter is to take the form of equestrian statue in bronze. Mr. Adrian Jones has been commissioned to carry out the work, for which 1,500*l.* has been collected. Another 500*l.* is required for the pedestal. The Exeter City Council will be asked to provide a suitable site.

The Young Men's Christian Association in Birmingham have decided to erect new premises at a cost of 35,000*l.* A good central site has been given and 24,000*l.* has been promised, besides a conditional promise of 2,500*l.*

The Newcastle Town Council, Staffordshire, has appointed Mr. A. S. Langley, architect, Manchester, consulting architect for the new baths at a remuneration of 40*l.*, and was resolved to erect the baths at a cost not exceeding 11,000*l.* A proposal to offer prizes for the best plans was defeated by the committee.

The Builders' Exchange League, of Pittsburg, has ordered a lock-out affecting 25,000 men. The League refuses to come to terms with the Building Trades Council until the hoisting engineers, now on strike, resume work at the Home Building, where a trouble started.

The Aberdeen Art Gallery Council have received a sum of 7,000*l.* for the purpose of extending the premises and erecting a sculpture hall.

The Architectural Association held their annual excursion this year at Worcester. It is eighteen years since a similar visit was made. The week's itinerary included visits to the following:—Huddington Court; Mere Hall; Westwell; Eastington Hall; Birtsmorton Manor; Priory Church, Grafton; Malvern; Hampton Lovett, with its memorial to the original Sir Roger de Coverley; Harvington Hall, with its seat of hiding-places; Chaddesley Corbett; Grafton Manor, Bredon; and Overbury villages; Woollas Hall; the Littletons and the charming manor-houses, and Evesham.

"The Rookery," a house at Clapham which was held on lease at a rental of 120*l.* per annum, being required by the London County Council, the subject was brought before a special jury. Mr. Bousfield, of the firm of Fox & Bousfield, for the claimant, estimated the site rental for the purpose of flats at 6*d.* per foot super, arriving at a total of 5,664*l.*, as 10 per cent. for compulsory sale, as the gross value. He is supported in that view by Mr. Burnett and Mr. Simpson, surveyors. For the Council, Mr. Green, of the firm of Wethill & Green, valued the property at 2,740*l.*, and a local agent, Mr. Henry, at a much lower figure. The jury awarded the claimant 5,100*l.* as compensation.

The New Kew Bridge has cost 172,585*l.* 14*s.* 2*d.* A further sum of 20,000*l.* is required for extras. A model and drawings of the bridge are to be sent to the St. Louis Exhibition.

The Medical Officer of Health for Stepney says that the last census of his district revealed an increase in the population of 13,308 during the ten years, and during the same period the number of inhabited houses decreased from 33,865 to 31,212. The result is that the increased population has been crowded on a diminished area and in a smaller number of houses.

Mr. Bumpus's book entitled "Holiday Rambles among the Cathedrals and Churches of Northern Germany" is now ready for publication.

Mr. Phil May, the black-and-white artist, died on Wednesday in his thirty-ninth year. There could be no question of his cleverness in realising character by a few strokes of pen or pencil, and more especially he was successful in representing the humblest classes of the Metropolis.

Mr. Andrew Carnegie has offered to his native town, Dunfermline, half a million sterling in Steel Trust bonds, to be employed in maintaining as a pleasure-ground the estate of Pittencreeff, near Dunfermline, which Mr. Carnegie acquired some time since, in the maintenance of a theatre for the production of first-class plays, the encouragement of horticulture among the working classes, and the advancement of technical education in the district.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER" Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Aug. 31.—Competitive drawings are invited for new offices to be erected at the corner of Sefton Street and Dixon Street, Blackpool. The architect whose design is selected will be appointed to carry out the work. The competition is limited to architects having offices and practising within the water area of the Fylde Water Board. Mr. C. Arthur, 34 Victoria Street, Blackpool.

HOWDEN.—Sept. 12.—Plans and estimates are invited for improving and extending the sewerage of the contributory place of Howden. The successful competitor will be awarded a sum of 15*l.* and the usual commission for superintending the execution of the works. Mr. Henry Green, clerk.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75*l.* for design placed first, and one of 25*l.* for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100*l.*, 50*l.* and 30*l.* respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

CONTRACTS OPEN.

AYLESBURY.—Aug. 11.—For repairs at the union workhouse. Mr. Frederick B. Parrott, clerk, 16 Bourbon Street, Aylesbury.

BACUP.—Aug. 12.—For the erection of an infants' school in Lanehead Lane, Bacup. Messrs. Smith & Cross, architects, Town Hall Chambers, Rochdale.

BIRMINGHAM.—Aug. 10.—For the erection of tramcar sheds, &c. Particulars will be forwarded by the City Surveyor.

BOLTON-UPON-DEARNE.—Aug. 10.—For the erection of a wall at Blacksmith Shop Corner, Goldthorpe. Mr. J. Ledger Hawksworth, clerk, Bolton-upon-Deane.

BRAMPTON.—For the erection of a teacher's residence at Lees Hill school, Cumberland. Rev. T. W. Willis, Lanercost Vicarage, Brampton.

BRISTOL.—Aug. 31.—For the erection of one or two warehouses at Cumberland Basin. Mr. W. W. Squire, engineer, Engineer's Office, Underfall Yard, Cumberland Road, Bristol.

CAMBORNE.—Aug. 10.—For rebuilding the business premises at Camborne, Cornwall, abutting on Commercial Square and Fore Street. Mr. Sampson Hill, architect, Green Lane, Redruth.

CHESTER.—Aug. 10.—For alterations and additions to the wash-house at the workhouse, Hoole. Messrs. John H. Davies & Sons, architects, 14 Newgate Street, Chester.

COLCHESTER.—For the erection of a Wesleyan church and school on the Wimpole estate, Colchester. Messrs. Goodey & Cressall, architects, Victoria Chambers, Colchester.

COLWYN BAY.—Aug. 24.—For the erection of isolation hospital, including pavilion and ward blocks, administrative building, laundry and outbuildings. Mr. Jos. H. Roberts, clerk, Council Offices, Station Road, Colwyn Bay.

DURHAM.—Aug. 11.—For the erection of club buildings, Langley Moor. Mr. F. Smith, architect, Brancepeth.

EPSOM.—Aug. 15.—For the erection of a dépôt, comprising cart-sheds, stables, horsekeeper's quarters, lofts and storehouses, and for a post-mortem room in Church Street, and stables and barn at the sewage farm in Hook Road. Mr. Edward R. Capon, surveyor, Council Offices, Bromley Hurst, Epsom.

EPSOM.—Aug. 20.—For putting-in foundations of the Tenth County Lunatic Asylum (Long Grove), near Epsom, Surrey. Mr. G. T. Hine, architect, 35 Parliament Street, S.W.

EXETER.—Aug. 10.—For the erection of building, &c., at the City Bank, Exeter. Messrs. E. H. Harbottle & Son, architects, County Chambers, Exeter.

FARNHAM.—Aug. 12.—For repairs to Waverley bridge. Mr. Arthur J. Stedman, surveyor, South Street Chambers, Farnham.

GILLINGHAM (KENT).—Aug. 19.—For the erection of a brick wall round a plot of land on Gillingham Pier and Wharf. Mr. F. C. Boucher, clerk, New Brompton.

GOLDTHORPE.—Aug. 10.—For building wall at Blacksmith Shop Corner, Goldthorpe, Bolton-upon-Deane. Mr. J. Ledger Hawksworth, clerk, Urban District Council, Bolton-upon-Deane.

GUILDFORD.—Aug. 18.—For the erection of a porter's lodge, &c., at the Woodbridge hospital, Guildford, and additions to the small-pox hospital at Whitmoor Common, near Guildford. Mr. Edward L. Lunn, architect, 36 High Street, Guildford.

NORTH OF ENGLAND SCHOOL FURNISHING CO., LTD.

MANUFACTURERS OF COMPLETE FITTINGS FOR

LIBRARIES, TECHNICAL & ART SCHOOLS,
SCHOOL DESKS, &c., and CHURCH FURNITURE.

Catalogues and Estimates Free on Application.

Sole Makers of WILKS PATENT "CLIMAX" SLIDING PARTITIONS.

Contractors to H.M. Government, London and Birmingham School Boards, &c.

Addresses: DARLINGTON, NEWCASTLE, SUNDERLAND, MIDDLESBRO, and NORWICH.

GWINEAR.—Aug. 8.—For the erection of farm buildings and repairs to farmhouse at Gwinear, Cornwall. Mr. Sampson Hill, architect, Green Lane, Redruth.

HALIFAX.—Aug. 27.—For the erection of official administrative block, comprising board-room, section-rooms and appurtenances, at union workhouse, Gibbet Street, Halifax. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HASLAND.—Aug. 18.—For the erection of mixed school, fence walls and conveniences at Grassmoor, and mixed school, fence walls and conveniences at Hasland, in the county of Derby. Messrs. Rollinson & Son, architects, 13 Corporation Street, Chesterfield.

HEATON.—Aug. 14.—For the erection of a pair of semi-detached houses in Heaton. Mr. Jas. Ledingham, architect, District Bank Chambers, Bradford, Yorkshire.

ILFORD.—Aug. 18.—For the erection of a post office at Ilford, for the Commissioners of H.M. Works and Public Buildings. Mr. J. Wager, H.M. Office of Works, Storey's Gate, S.W.

IRELAND.—Aug. 10.—For the erection of a teacher's residence at Knockanevin, co. Cork. Plans and specifications can be seen at the Presbytery, Kildorrery.

WOMBWELL.—Aug. 20.—For the erection of six houses, Hough Lane, Wombwell, Yorks. Mr. A. B. Linford, architect, Carlton Villa, Wombwell.

IN January last the 'Bishop of Carlisle' appointed a commission to consider the need for the extension of spiritual provision in Barrow, to make suggestions as to the most eligible sites for additional churches, as to the necessity of new mission buildings and as to the necessity of any rearrangement of parochial boundaries. This commission has now reported and suggests the building of a new church to accommodate 600 worshippers on Walney Island, on a site given by Messrs. Vickers, Sons & Maxim, adjoining the present church and burial-ground; that the site of a new central church to accommodate 1,600 be secured in Abbey Road at a cost of 4,000*l.*, with a view ultimately of transferring the living of St. Mark's to it, and also with a view to the removal of St. Mark's Church to some other part of the parish and its rebuilding as a separate church; and the securing of the site for a new church on Barrow Island, with a view of building a large church and a convenient mission-room.

COMPETITION OPEN.

HEYWOOD.—Sept. 14.—Competitive designs are invited for library building to be erected in Church Street at a cost of £10,000. Premiums of 30%, 20% and 10% will be awarded for designs adjudged of sufficient merit and placed first, second and third in order respectively. Mr. J. Ainsworth Settle, Municipal Buildings, Heywood, Lancs.

VARIETIES.

Tuesday the King paid a visit to Osborne in order to open the new Naval College, of which Mr. Hawks, of H.M. Office of Works, was the architect, and Mr. McManus, of Messrs Smith, the contractor.

THE Jewish community in Manchester having decided to erect a hospital of their own, the foundation-stone was laid at Cheetham on the 23rd ult. The site of the new hospital, which will be called the Victoria Memorial Jewish Hospital, is in Elizabeth Street, a short distance from the main thorough-

fare, Cheetham Hill Road, and the cost of the building when completed (a portion only is to be erected now) is estimated at 10,000l. to 12,000l.

MR. W. A. DUCAT held an inquiry on Wednesday at the Widnes town hall, on behalf of the Local Government Board, into the application of the Town Council for sanction to borrow 800l. for the reconstruction of the river wall on the southern boundary of the accident hospital. Mr. Craik, deputy town clerk, stated that 250l. out of the 800l. had already been expended, and it was pointed out in a letter to the Local Government Board on June 18 that the matter was urgent, as the adjoining property was in danger. The damage to the wall appeared to have been caused by the action of the tide in gradually undermining the foundations of the wall. On July 3 the borough surveyor reported that the remaining portion of the wall was in a defective condition. The committee made an inspection of it, and they had decided to have it reconstructed. The contractor's tender was 550l. Evidence bearing out the above having been given, the inquiry terminated.

NEW and commodious tramway offices, erected from the designs of Mr. C. Brownridge, borough engineer, were opened recently in Birkenhead. The building, which has cost about 3,300l., is two storeys in height, having a frontage of 76 feet to Laird Street, where the main entrance is situated. On the ground floor is the general office, 30 feet by 22 feet, a fireproof strong room, and timekeepers and inspectors' rooms. On the upper floor are the manager's room, store rooms and lavatories. The building is fitted throughout with electric light. The main façade is relieved by two oriel bay windows on the upper floor, these of the main entrance having been built entirely of dressed Bryntey stone from the Wrexham quarries. The remainder of the building has been constructed of common machine-made brick with red pressed brick facings, string-courses and stone dressings.

THE Bridge House Estates committee recently took a census of the vehicular traffic over the City bridges, for the purpose, primarily, of ascertaining the extent to which Southwark Bridge is used. A record of all vehicles passing north and south over the four bridges was kept for a week. It was found that during that period 125,373 vehicles passed over London Bridge, 62,644 going northward, and 62,729 southward; 24,432 over Southwark Bridge—12,148 northward, and 12,284 southward; 112,305 over Blackfriars Bridge—56,618 northward, and 55,687 southward; and 85,353 over the Tower Bridge—43,497 northward, and 41,856 southward. It

will be seen that Southwark Bridge is the least used, and it is in a great measure due to the steep gradient on the City side, which is avoided as much as possible by the drivers of heavy vehicles. It is for the purpose of remedying this defect that the Bridge House Estates Committee have approved of a scheme in favour of the practical rebuilding of Southwark Bridge, at an outlay of nearly 350,000/.

ELECTRIC NOTES.

At the monthly meeting of the Chorley (Lancs) Town Council the special general purposes committee recommended that "the Chorley Electric Lighting Order, 1898, be disposed of to the best advantage." Councillor Stone moved an amendment to refer the subject back to the committee. Councillor Gideon Jackson thought the Corporation should do all in its power to keep the order alive if the Board of Trade would sanction a further extension. It would hardly be right to let it lapse after spending 800/., but under no consideration should they let the order lapse without fighting for it. The amendment was carried.

MR. G. H. COTTAM, Hampstead borough electrical engineer, submitted a statement to the Hampstead Council, showing that their electric-lighting works were extremely prosperous during 1902-03. The cost of the works was 17,390/., as against 16,785/., in the previous year. Including interest, sinking fund and all charges, each unit sold cost the Council 3/92d., as against 4/66d. in the previous year, and produced in revenue 4/33d., as against 4/34d., so that the profits per unit sold show an increase, although the charges are slightly less.

THE tenth half-yearly meeting of the Great Northern and City Railway Company was held on Tuesday at the Westminster Palace Hotel, Sir Charles Scotter presiding. The chairman said the line was practically completed between Moorgate Street and Drayton Park. The generating station was complete and the whole of the machinery ready for work. A great part of the rolling-stock had been delivered and the remainder was practically completed. He thought he was justified in stating that before their next half-yearly meeting the line would practically be open for traffic between Finsbury Park and Moorgate Street. They looked upon the extension of the line to the Bank as being a very important part of the system of the railway, and although it would not be ready when the

other part was completed, they did not intend to delay the opening of the line to Finsbury Park. They had every reason to believe the line would be opened with success. They were strongly of opinion that the Finsbury Park extension and the extension to the Bank were most important factors in connection with the success of the railway, and although they anticipated a very heavy traffic even to Moorgate Street, they were quite certain that the traffic would be considerably increased when they were able to announce that they could carry passengers from Finsbury Park to the Bank. The directors, in the report, state that the main line from Moorgate Street, through Old Street and Essex Road, to Drayton Park is now almost completed. The extension from Drayton Park to Finsbury Park is in a forward state, and the whole of the tunnels are expected to be completed by the end of August. The Statute at Highbury authorised by the company's Acts, 1902 and 1903 is in course of construction. It is not intended to fill up the vacancy on the board created by the death of Sir Allen Sarle.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester have just supplied their patent warm-air ventilating Manchester grates to the Clifton Street school, Swindon.

MR. T. A. HARRIS, Phoenix Works, Collingwood Street, Blackfriars Road, has prepared a neat and businesslike price list of sanitary fittings and appliances, all of which are fully illustrated and priced.

THE triumphal arches at Cork on the occasion of the King's visit were designed and erected by Messrs. Defries. The decoration and illumination of the premises of the Bank of Ireland, the Munster and Leinster Bank, the City Club, County Club, and of the leading business firms were all executed by them.

MESSRS. CHAMBERS, SCOTT & CO, engineers, crane builders and machine-tool makers, Motherwell, announce that they have taken as partner Mr. John Chambers, Wh. Sch. late chief engineering draughtsman with Messrs. Wigham Richardson & Co, Ltd., Newcastle-on-Tyne.

THE inhabitants of Ropley, near Alresford, Hants, are going to erect as a memorial to the late Queen Victoria a new clock in their parish church, to strike the hours, and with two large external dials, from the designs of Lord Grimthorpe. Messrs. Wm Potts & Sons, clock manufacturers, Leeds, have the work in hand.

BUILDING AND BUILDERS.

MESSRS. MORRISON & SONS, of Wavertree, Liverpool, have obtained the contract for the erection of the new hospital at Bakerley, which will cost 121,475 $\frac{1}{2}$ l, or about 500 $\frac{1}{2}$ l. per bed.

THE foundation-stone of new county buildings at Northerton, which are estimated to cost altogether over 40,000 $\frac{1}{2}$ l, has been laid. The new buildings are ornate, and will provide accommodation for all the departments of the Council.

A BOARDING SCHOOL is in course of erection at Harborne in connection with the General Institution for the Blind, Edgbaston, Birmingham, which will be the first building in England specially constructed for teaching blind children by the kindergarten method. The object which the committee have in view is to train the unfortunate little ones under their parents to earn their living, and thus prevent them becoming a burden to themselves, to their friends or to the poor law. The foundation school, the foundation-stone of which has just been laid, will accommodate forty children, and will cost about 15,000 $\frac{1}{2}$ l. An excellent site has been secured on the Court Oak Road, with a frontage to Woodville Road. The building will be of brown brick, with red brick bands and white Grinshill stone dressings, and the roof will be tiled. The elevations will be of a very simple character. The main entrance faces Woodville Road, in a slightly projecting bay, with plain columns and pilasters. The windows will be plain, with rubbed, gauged, and red-brick arches, varied about half-way down by the projecting bay window of the dining-room. The Court Oak Road front will have a gable end with quoins. This part of the building will contain two dormitories, and the other two dormitories will be lighted by one wide dormer window in the centre. On the ground floor there will be three classrooms, two play-rooms, four music-rooms, dining-room, kitchen, scullery, pantry and larder, rooms for mistresses and matron, small dispensary, cloak-rooms, boot-rooms, airing-room and the usual offices. There will be a couple of porches leading from the play-rooms to the spacious play-grounds on the Court Oak Road side. The upper storey will be divided into four dormitories, mistresses and servants' bedrooms, linen, wardrobe and sewing-rooms, bath-rooms and lavatories. There will also be an isolated wing for sick children, a room for convalescents and a nurses' room, with separate staircase and entrance. The architects are Messrs. J. A. Chatwin & Son, Birmingham, and Messrs. Collins & Godfrey, of Tewkesbury, are the builders.

WROUGHT-IRON WINE BINS AND STRONG-ROOM FITTINGS.

THE Universal Wine Bin Company, of Alfred Road, South Norwood, S.E. (Mr J. Stevens, manager), are manufacturers of wrought-iron wine bins, cellar and strong-room fittings, in which class of work they have had, we understand, large and varied experience, while among the facilities that they possess for executing orders with despatch are some up-to-date machines and a number of ingenious tools, as well as labour-saving appliances of the newest pattern. Due regard is paid by the firm in question to the importance of having wine bins and cellar fittings efficiently designed and carried out, both with the view of properly economising space and insuring freedom from risk of breakage. Strong-rooms, moreover, fitted up by them with their improved wrought-iron fittings for banks, insurance offices and solicitors' offices, &c., combine, we are assured, not only great strength with lightness, but economise space and allow of a free circulation of air, besides possessing the advantage of being easily removed when necessary. In this connection it may be mentioned that among other orders recently executed by the company in question was one from the Bank of Adelaide for extensive strong-room fittings, which gave much satisfaction.

NEW CATALOGUE.

THE new edition of the catalogue of Builders' Ironmongery (No 7), issued by Messrs. Hart, Son, Peard & Co, Ltd., shows the advantages of an organisation which is well directed, and has gained power by long experience. As every architect knows, the history of the establishment goes back to "the brave days of old," when Gothic prevailed, and the production of a piece of metalwork was so regulated as to come within the province of ecclesiasticism rather than of commercialism. But there could be no better safeguard against careless work than the aspirations of the time. That the old spirit still prevails the catalogue is evidence. The objects in it are as diverse as is possible with builders' ironmongery, but the least of them shows a regard for excellence. If manufactured by the firm the forms are suitable, and if they are ornamented there is fitness, as in the Gothic days. If produced by patentees there is care exercised in the selection. The consequence is that the pages can be examined without finding anything which will show indifference to good taste. That is saying much when we know

how far vulgarity is supposed to be attractive to the multitude, and the jerry-builder makes showy door furniture serve to mislead by diverting attention from defects in construction. In other catalogues will be seen what can be done by Messrs. Hart, Son, Peard & Co. in art metalwork and ornamental work on a large scale, but the strict supervision which characterises the firm is no less demonstrated with the varied stock of ironmongery which can meet all requirements of ordinary buildings and, we may add, at low prices.

HENNEBIQUE'S SYSTEM OF FERRO-CONCRETE CONSTRUCTION.

A NUMEROUS party of architects, engineers and others interested in constructional works accepted the invitation of Messrs. W. Cubitt & Co. to witness on the 29th instant at Messrs. Whitbread's Brewery, Tottenham, what turned out to be a remarkably interesting and successful demonstration of the strength and weight-sustaining capabilities of ferro-concrete construction on the Hennebique system.

The building which Messrs. Cubitt & Co., who are licensees under the patents, have erected from the designs of Mr. Arthur Dixon, will be used by Messrs. Whitbread as a store, a purpose for which the Hennebique system is of the greatest value, as it provides the maximum clear floor space combined with the greatest strength, as was triumphantly demonstrated on this occasion. For a description of the test itself we cannot do better than give the official report as follows, adding that the ferro-concrete cement was supplied by Messrs. Martin, Earle & Co., of Queen Victoria Street, E.C.:

"The floor has a clear span of 25 feet 7 inches between the walls; the thickness of the floor is 5 inches, finished on top with cement paving $1\frac{1}{2}$ inch thick; the floor is supported on main beams 14 inches wide, 22 inches deep and 11 feet 3 inches from centre to centre, with secondary beams 5 inches wide and 9 inches deep. One complete bay was tested, so the total surface under the load was 25 feet 7 inches \times 11 feet 3 inches = 288 feet superficial. The floor was calculated for a superimposed load of 4 cwt. per foot superficial, therefore the normal test load was $288 \times 4 = 57$ tons 12 cwt. The load was composed of bags of ballast; 864 bags were filled with ballast, so that each bag with its contents weighed exactly 2 cwt., giving a total load of 86 tons 8 cwt., being the normal load plus 50 per cent, the agreed test to which the floor was to be subjected. The instruments used for the tests

enabled the deflection to be ascertained to the twentieth part of a millimetre or the five-hundredth part of an inch. Three of these instruments were used, one in the centre of the beam and one at each end, 1 foot away from the wall. They were placed in position and adjusted to zero by Mr. W. Dunn. At 11.45 the load was commenced to be put on; the instruments were noted by Mr. Dunn for each 10 tons of load up to 50 tons, and again when the load equal to 4 cwt. per foot had been reached.

The total deflection for the normal load measured in millimetres is 29 millimetres in centre, the average of the deflection of the piers 0.85 millimetre, giving a real deflection of the beam of 2.05 millimetres, or $\frac{1}{3800}$ of the span. The additional load of 50 per cent. equal to 6 cwt. per foot superficial was then put on, and records taken as shown on diagram, sheet two. The total deflection for this load of 86.7 tons was 4.8 millimetres, the average of the deflections of the piers 1 millimetre giving a real deflection of the beam of 3.8 millimetres, equal to $\frac{1}{2052}$ of the span. The total load of 86.7 tons was completed at 3 o'clock, and its removal was begun at 4 o'clock and finished at twenty-five minutes past five. The deflection was then .35 millimetre in the centre, .65 millimetre on north pier, and .05 millimetre on south pier, or an average of .35 millimetre of the piers, so that at that moment there was no permanent deflection. At twenty-five minutes past seven (two hours after the removal of the load) the instruments read as follows:—Centre, 0.3 millimetre; south side, 0.0 millimetre; north side, 0.6 millimetre, showing that the beam had completely recovered itself. During the whole of the experiment there was no trace of a crack or fissure. The total deflection under the 6 cwt. per foot load is represented by the space between these two lines.

= 3.8 millimetres.

TRAMCARS AS HOUSES.

THE Liverpool Corporation having substituted electricity for horse-power on the tramways, the old cars have been sold to various purchasers. They have settled down, so to speak, says the *Liverpool Courier*, to a comfortable old age in rural byways, in the gardens of villadom, on the playing fields of the "flannelled fool and the muddled oaf," and on the beach and amidst the sandhills of the wave-washed coasts of West Lancashire and the Wirral peninsula. They were no longer of

use in the tramway service, not even as trailers; and they went to the highest bidder. In the early days of the clearance they were in great demand. The best cars found a ready market, and are now doing duty as snug summer-houses and studios in many a suburban garden, while others may be seen in various places between Liverpool and Ainsdale and Leasoweth and Hoylake serving their purpose admirably as shelters, for fishing vans, hen-cotes, workmen's huts, &c. Numerous cricket and football clubs of the minor class aspired to the dignity of possessing a tent by purchasing Mr. Bellamy's surplus stock, and various volunteer corps have also been good customers, judging from the trams and omnibuses so conspicuous in the vicinity of Altcar Rifle Range. The prices have varied from 7*l.* 10*s.* to 30*s.*, five trams at year realising 6*l.* 12*s.* each, and fifty-four omnibuses 8*s.* 11*d.* each. In almost every case the routes along which the old cars formerly rattled are still indicated by their painted signs—a reminder of their past glory. Thereby hangs a tale. Some time ago complaints were made about a wooden structure which had been dumped down near the end of New Brighton pier. It was one of the old horse cars. The proprietor of the shanty did a roaring trade in the sale of ginger beer, Eccles cakes, mint rock and such like luxuries. Whether the Klondike possibilities of the establishment excited the jealousy of rivals or not is a matter of little moment; suffice it that an objection was raised against it and against Mr. C. R. Bellamy, general manager." Mr. Bellamy is certainly one of the ablest and most successful general managers of tramways in the country, but as yet he has not had an opportunity of displaying his enterprise in the ginger beer and mint rock line, his connection with the business in question being limited to a few unobliterated letters in paint.

UNDERGROUND BAKEHOUSES.*

THE most progressive part of the Factory and Workshops Act 1901 is undoubtedly the section relating to underground bakehouses. The real value of this section is at the present time difficult to estimate, but we can safely say that it will be in direct ratio to its practical application.

* From a paper read by Mr. T. Foley Cass at the Congress of the Sanitary Institute.

The general method of construction, or what appears to be nearer the mark, of the conversion of underground rooms into bakehouses, will be sufficiently well known to you without any description here. Many of these places are low, damp, dark, miserable hovels, which ought to be condemned without the least hesitation; but, on the other hand, there may be many other places which are suitable, or can be made suitable for use.

I believe some attempt is being made to set up a standard of suitability upon which a certificate for the continuation of any underground bakehouse may be granted. This may or may not be a wise course to take, for no doubt each case will have to be considered on its merits; however I should like to state what appears to me should be required before any certificate is given.

Construction, &c.—All the requirements of the Factory and Workshops Act and the Public Health Acts relating to water-supply, sanitary conveniences, drains, ash-pits and sleeping apartments should be strictly complied with.

The floors and tops should be free from dampness and constructed of, or lined with, a smooth impervious material (preferably the floors of cement concrete, walls lined with glazed brick or tiles, and the tops of cement concrete on steel joists). No wooden casements or matchboard linings should be allowed.

The floor-space of any workroom should not be less than 150 superficial feet, the depth of the floor below the highest ground level adjoining or nearest to the bakehouse should not be more than 7 feet, the height from the floor to the ceiling should in no case be less than 8 feet 6 inches, and the ceiling should not be less than 3 feet above the highest ground level, which will be found to be quite little enough for the purposes of lighting and ventilation.

If this arrangement was put into practice the height from floor to ceiling would work out somewhat as follows:—

Where the depth of the floor below the ground level is	The height from floor to ceiling would be
7 feet	10 feet
6 " 6 inches	9 " 6 inches
6 " 0 "	9 " 0 "
5 " 6 "	8 " 6 "

Windows should be provided in all workrooms equal to not less than one-tenth of the floor space, made to open directly to the open air close to the ceiling, and to half the extent of the window area. No window should extend below the

THE

CUNDALL

PATENT

OIL ENGINE

EXTRACTS FROM LETTERS RECEIVED.

"I shall be pleased to show the 20 B.H.P. Oil Engine to any of your clients, and can thoroughly recommend it."

"I have very great pleasure in testifying to the efficiency of the 20 B.H.P. Oil Engine which you supplied for driving the dynamo, which gives current of equal H.P. for Lighting and Heating in the Hotel. The Engine has now been in use almost for over three months, without the slightest hitch. It gives the most satisfaction and the most favourable results."

"You will be glad to know that the 8-Brake Oil Engine which I got some time ago is giving me entire satisfaction. It is running very steadily—so much so that I am able to supply Electric Light direct, without the slightest waver in the current. It is very easily started. I should say your Engines are of the highest perfection as possible."

ground level except in the case of windows looking into an open area not less than 3 feet in width and free from any obstruction of light; also in addition such other natural means of lighting should be enforced as will adequately light any part of any workroom by ordinary diffused daylight.

No underground bakehouse should be considered suitable in which it is necessary to use artificial light during any period of ordinary daylight.

In addition to the windows, adequate and suitable means of permanent ventilation should be provided, also means for carrying away any vapours or fumes directly from all ovens and gas-stoves into the open air or chimney-flue should be provided.

No system of ventilation should be considered by which there is any probability of dust, dirt or obnoxious effluvia entering the building, and what is known as through ventilation should be insisted upon.

Protection from Sewage.—No drain should be allowed to pass immediately over any part of the bakehouse or oven, and there should be a free space of about 2 feet between the walls of the oven and any wall of the bakehouse which is backed by the earth above the level of the bakehouse floor, and all area gullies should be provided with suitable valves to prevent flood waters from the sewers entering the building.

Approaches—The approaches to an underground bakehouse should be by means of properly constructed and efficiently lighted stairs, furnished with proper hand-rails, and, if internal, with proper screen and door above ground level. No step-ladders should be accepted, and no trap-doors or hatchways should be allowed in the ceiling of the bakehouse for any purpose whatever.

Storage-rooms—Sufficient storage-rooms for materials used in baking, and proper coal or coke bunkers, should be provided, which should be entirely separated from any baking-room by means of walls and doors, and should be separately lighted and ventilated.

In other respects all the furniture (troughs, benches, &c.) should be easily movable, and there should be no fixed bins, proof-closets or other fixtures in any baking-room. No part of the bakehouse should be used for any laundry, dwelling or other domestic or business purpose which is not in or incidental to the process of baking. It would therefore be necessary, where dwellings or shops are attached to the premises, to see that they are separately provided with adequate accommodation. The bakehouse, as regards its situation in respect to proximity

of insanitary areas, obnoxious premises, sewers or other objectionable contaminations, should be fully considered before granting any certificate.

VENTILATION OF THE HOUSE OF COMMONS.

THE report of the select committee of the House of Commons on the subject of the ventilation of the Chamber has been issued. The committee were first appointed in April of last year, and reappointed in June of the present Session. Seven teen witnesses were examined, and the recommendations which the committee make are summarised as follows:—"1. The substitution of electric fans for the present exhaust furnaces one fan to discharge into the shaft over the Commons lobby the other into the shaft above the ladies' gallery. 2. Simplification, so far as is possible, of the inlet passage and arrangements for its more thorough cleaning. 3. Use of water screens in place of the present water spray. 4. Adoption of the new improved more powerful intake fan. 5. Tentative introduction of air beneath members' seats. 6. More frequent removal for purposes of cleaning of the matting on the floor and elsewhere. 7. Placing the whole of the cleaning arrangements under one authority. 8. The appointment of a sanitary officer, under the Office of Works, to direct and superintend the ventilation of the House. 9. The institution of the inquiry into problems of ventilation still unsolved, with the view of introducing further improvements in the present system."

The evidence placed before the committee at some of its earlier meetings showed, the report says, that the condition of the committee-rooms, corridors and some other parts of the House was far less satisfactory than that of the Chamber itself. Since the committee began its labours, however, considerable improvement has been effected by the introduction of fans into the committee-rooms, and the worst of the evils previously complained of have been remedied. The inquiry recommended will, it is hoped, throw much light not only on the ventilation of the Chamber itself, but also on that of the committee-rooms and other parts of the House. Pending the results of that inquiry, the committee are not prepared to make any recommendations in respect to the latter, except so far as to advise that the introduction of fans, which they say should be, if possible, noiseless fans, should be extended. They add that no system of ventilation of the Chamber and its adjuncts can

duce satisfactory results unless the working of the system is accompanied and supported by a thorough, systematic frequent cleaning of all parts of the Chamber and its contents. It is also obvious that no such cleaning can be thorough and effective unless it is carried out under the direction and superintendence of one responsible authority. In view of the health and comfort of the members, no expense should be spared in making that cleaning as effective as possible, and in repeating the necessary operations as frequently as is desirable. The day's dirt ought to be removed every day, and more complete purification ought to be carried out when the House is not sitting. Every system of ventilation, however apparently good, needs constant watching, in order that its efficiency may be measured and its shortcomings detected. Moreover, the knowledge of ventilation, though distinctly progressing, is far from being perfect, and the experience which might be gained by the careful and continuous observation of what takes place in attempting to ventilate a building as the House may confidently be expected to furnish further improvements in the future. The committee, therefore, while recognising the valuable services rendered by the present staff from an engineering point of view, recommend that there should be also a sanitary officer of recognised scientific knowledge and experience. It would be the duty of such an officer to watch over the ventilation of the House, to make such observations, and even experiments, as may seem desirable to ascertain how far the system is working satisfactorily, to make such recommendations as may seem to him necessary or desirable, and to advise generally on the ventilation of the House.

CALIFORNIAN REDWOOD.

The Foreign Office has just issued a report from the Consul-General at San Francisco in which he states that a new demand has sprung up for redwood, a material which California alone can supply. It has been discovered by the chief engineer of the Niagara Falls Power Company that, under certain conditions, which rule in connection with that enterprise, the hardest wood is inferior in resisting power to California redwood. The company sent an agent here to obtain figures for furnishing several million feet of the local lumber for one of the great works at Niagara Falls. It appears that the engineer-in-charge of the Niagara Falls Power Company had recommended

that redwood should be employed instead of steel for a great tunnel to be constructed this summer. The reason given for the preference for the California wood was that when water passed over it continuously there formed a surface of soapy and pasty nature which was proof against corrosion, whereas in the case of steel the particles of sand and matter carried with great velocity from the Niagara River cut into and destroyed the steel in an incredibly short space of time. The Redwood Association was asked if it could furnish 3,000,000 feet of redwood for delivery in Buffalo in July next, and gave an affirmative reply. The redwood lumber to be supplied for the Niagara power tunnel is to be 3 inches by 8 inches, and to be set on the narrow end, the length to be from 12 to 20 feet. Redwood has been found exceedingly useful in the construction of the big pipes used for the conveyance of water to many of the electric-power houses in the northern part of the State. These pipes are built up and banded. They cost less than metal pipes, are more durable, and are more easily carried around the sharp curves followed by these great water lines. It will outlive all other woods when kept constantly moist. While it is not non-combustible, which quality some enthusiasts have erroneously ascribed to it, it burns much more slowly than any other kind of timber used for building purposes, as it contains no inflammable oil or resin. While it is not desirable to be used as a fire wall, the resistance it offers to the inroads of fire has been the salvation of many dwellings constructed with it. The discarded stumps of redwood felled for their lumber many years since have come into favour for the manufacture of furniture and the interior decorations of buildings, the curled grain making beautiful figures, and the wood itself taking a fine polish. Just at present California redwood is in great demand in the East, partly because the forests in that section have become exhausted, but chiefly because of the variety of uses to which it can be profitably put.

PRESERVATION OF TIMBER.

THE subject of "Timber-Treating Plants," with especial reference to railway ties, was treated by Mr. W. W. Curtis before the American Society of Engineers on May 20. Attention was called to the fact that, although the subject of timber preservation had been before the public for a great number of

years, it had received but little consideration until recently, due, no doubt, to the fact that the timber supply seemed inexhaustible. As time passed on new sources of supply were made available at former rates, because of new methods of merchandising and cheaper rates of transportation. Then too the actual results to be obtained from such treatment were either unknown or disputed. As such treatment is necessarily somewhat expensive in first cost, it was not used by such managements as were desirous of making a good showing for the moment. To-day, however, conditions are different. The value of such treatment is recognised, as may be inferred from the fact that the number of ties to be treated in the present year will probably equal the product of the last twelve years.

As might be expected, several processes are in use. One of the oldest, and also one of the cheapest, is burnettising, or the injection of zinc chloride. Good results are accomplished by this method, but it is open to the objection that the salts being soluble after a time are dissolved out of the timber, so that when the amount remaining becomes less than a certain minimum, fungus life can begin its work anew. A condition for good results with this method especially, as well as with others, is the thoroughly drying of the ties after treatment, and the placing of these in a well-drained road bed.

Another method is the Wellhouse or zinc-tannin treatment. This to some extent overcomes the objections to the former process by sealing up the ducts in the timber by means of injections of glue and tannin following that of the chloride. Doubt has been expressed of late as to the additional life secured by the glue and tannin being equivalent in value to the additional cost of the treatment. As the additional cost of this method as compared with the former is but 3 cents per tie, it would seem that a small increase in the life of the tie would warrant the additional expense, each year's life of the same being estimated at a value of 5 cents.

Still another method which is in use at the present time is that of the zinc creosote treatment. As creosote is the best timber preservative known, it would naturally be expected that any treatment in which this is employed would be an improvement. In regular creosoting such a large amount is absorbed in obtaining a distribution sufficient to have any value that the cost for the oil alone in the case of a 6-inch by 8-inch tie amounts to 30 cents on the basis of 12 pounds per cubic foot and a cost of 1 cent per pound for the oil. This at present is generally considered prohibitive, although a life of twenty years can be expected as the result of such treatment, provided

the ties do not cut out before this time. To overcome this difficulty several methods are used in which a combination of creosote and zinc chloride is employed. The zinc-creosote treatment undoubtedly is of great value, and in Mr. Curtis's judgment superior to most of the other methods employed.

A fourth method employed is the Hasselman process. This consists in the boiling of the timber in a solution of several substances, the principal one being sulphate of iron. A record of efficiency by this process has not as yet been definitely established, although it is no doubt the cheapest method that can be employed.

The cost of treatment per cubic foot by the various methods not including any charges for profit, depreciation or interest varies from 3½ cents for burnettising, 5 cents for zinc-tannin and 7½ cents for zinc-creosote, to 15 cents for creosote on the basis of 12 lbs. to the cubic foot. Although it may not be possible to determine which particular treatment is the most profitable, it is safe to say that whenever an inferior tie can be purchased and treated by any one of the processes, and then cost no more than a white oak or other first-class tie, the adoption of the treatment is justified.

Mr. Curtis then described a plant recently erected. Such a plant, to be of the greatest value, should be so arranged that any process which may be developed in the future may be used. The description included the proper method of handling the ties, both before and after treatment. The requisites of a plant proper, as regards the machinery required, was outlined, including the cylinders in which the timber is treated, the means of generating the steam used for steaming the timber, the condensers and air-pumps for creating a vacuum in the cylinders, and such pumps as are required for transferring a fluid used in the treatment from cylinders to storage tanks *vice versa*, and also for supplying a pressure for forcing a fluid into the timber.

In the discussion which followed the paper, it was brought out that only such treatment as caused the fluid to penetrate all parts of the timber was of value, although several compounds for external application which are being advertised might be of benefit in certain special places, where timbers were exposed to very humid air or similar conditions. Very little data has been obtained as to the effect of treatment on the strength of timbers, the holding power of spikes or similar details. Another fact brought out by the discussion was the destruction of the tie, not by decay, but rather by cutting out, in the case of treated timbers.

STRIPSO

In 7, 14, 28 and 56 lb. kegs.

Quickly and thoroughly removes PAINT, VARNISH, STAINED ENAMEL, RUST or GREASE, however dry or thick, without injury to the Wood or Metal, leaving the surface perfectly clean and ready for applying new Paint or Varnish.

Saves more than half the ordinary cost of stripping Paint and Varnish.

C. CHANCELLOR & CO., 13 CLERKENWELL ROAD, LONDON, E.C.

WHAT WE SAY

VELURE

A new and perfected JAPAN PAINT, superseding varnish, with remarkable spreading, elastic and weather resisting properties. One coat equals two coats of ordinary paint and one of varnish. In 120 colours. Any shade matched. Sanitary—washable. Will not crack, chip, peel, blister, or fade. Twelve months' guarantee given by the manufacturer. Saves time, labour, varnish and money.

C. CHANCELLOR & CO.,
13, CLERKENWELL ROAD, LONDON, E.C.

WORTH

One Gallon will
Cover about 90
Square Yards.

TRYING.

FINISHED LIKE A MIRROR.

Your white Velure is the best we ever tried on the Yachts. Two coats really finished like a mirror. It far surpassed any enamel or ivory japan we ever used. I have done all the Windows in the house with it.

HUGH DORRIAN, Yacht Builder.
Nonsquarter, Kirkeubbin, Co. Down, June 24, 1901.

BETTER FINISH. BETTER WEAR.
FEWER COATS. LESS MATERIAL.

WHAT CUSTOMERS SAY

H.M. THE KING.

I have had it used at Sandringham for H.M. the King and found it most satisfactory. It was used on some large additions last year.

C. SMEDLEY BECK, Architect.
11a, Prince of Wales Road, Norwich, Jan. 21, 1903.

ARCHITECT.

I am exceedingly pleased with the result of the Velure I had last year. Our doors look and feel like ivory, and show every appearance of great durability. I find that they keep very clean, and do not take the dirt.

A. B. PURDIE, F.R.I.B.A.
Meadow Grange, Blean, near Canterbury, Jan. 2, 1902.

IN A STEAM DISINFECTOR.

I am pleased to state that the Velure has been a perfect success so far. It has been subjected to great heat, steam pressure, and withstood the expansion and contraction of the iron, and there are no cracks or flaws to be found, the surface being perfect. It was applied by unskilled labour, the hospital porter doing the work.

J. BROOK, S.I.C., A.S.I., Surveyor, R.D.C.,
Stratford-on-Avon, 5th December, 1902.

UNDER WATER.

Velure gives a beautifully smooth surface, which remains hard under water, and does not foul easily.
JOHN MACKENZIE, Sail Maker.
Sandbank, Argyllshire, Sept. 26, 1901.

STANDS ANY AMOUNT OF EXPOSURE TO SUN OR FROST
HEAT OR DAMP, WITHOUT CRACK OR BLISTER.

JOINTS OF DRAINS.

ONE of the papers read at the Sanitary Congress, Bradford, related to "Cement Joints in Drains and Drain-testing." Mr. James G. D. Armstrong, the author, said:—

It has been patent to me for many years that cement joints in stoneware drain pipes fail to maintain their power of standing both or either the smoke and hydraulic tests, and this sometimes soon after the laying of the drains, and sometimes after a considerable lapse of time. As a rule, however, I find that failures can be traced to either the materials being at fault or the method of laying.

[I have often found the flanges of pipes cracked after the water test has been applied, and even before filling in the trenches, and at other times months afterwards when the pipes were "bared" for connections. These failures—notwithstanding the drains have been tested by water and found watertight at the time of construction—are due to one or other of the following causes, viz:—

1. Swelling of the cement in the joint.
2. Uneven expansion of the concrete bed, especially if made of hot cement or ground or lias lime, and not of equal fineness, as when deep holes are filled up in the bottom of the trench or in large "hand-holes"—the expansion lifts the pipes from their bed.

3. Uneven settlement of the bed, causing deflection of the jointing joints.

4. Uneven or careless filling-in of the trench, or workmen treading on or knocking the pipes, or by debris falling, &c.

5. Testing or filling-in the trenches before the cement is thoroughly hard.

6. Contraction of the cement in the joints.

7. Failure of the joint to stand the pressure, excepting, of course, the jointing material.

Causes 1, 2 and 6 are due entirely to the quality of the materials at the time of using or to their wrong manipulation. Causes 3, 4, 5 and 7 are due to a lack of the thoroughly practical and theoretical knowledge of Portland cement which is absolutely necessary that no failure may arise from the material. In this short note a complete specification of the material cannot be given, but suffice it to say it should be free for contraction, expansion, adhesion, disintegration (by boiling for twenty-four hours after parts have been made for twenty-four hours), specific gravity, which should be about 3.1

—weight per bushel is an unreliable guide—also whether it contains free lime or free gypsum; then further for ensile strain, which should be not less than 500 lbs per square inch, at seven days the briquettes being mixed up as stiff as possible and "thumbed" into the moulds; and lastly, but perhaps the most important, its fineness, 80 per cent. of which shall pass through a sieve having 32,400 (thirty-two thousand four hundred) holes per square inch, and the whole through a sieve of 2,500 (two thousand five hundred) holes per square inch. If not very finely ground it may expand months after using, thereby cracking the flanges or loosening the key between the pipe and the cement.

Cause 2.—I do not agree with the use of hot lime being used for foundations owing to its expansion; so far as lime is concerned it should rank in the same category as clay joints. Cement only should be used.

Cause 4.—As to this, probably more failures in drains found by retesting arise from these faults than any other, and "carefulness" alone is the remedy, and the same applies to clause 5, both respecting filling and testing.

The thoughts—on reflection—of failures under 4 and 5 depict a gruesome picture in the face of modern science, and the British workman, who is generally employed to put in drains. Trench excavated—much too narrow—pipes laid and jointed—men very careful—inspector tests by water—the inspector in a hurry—drains full, ten minutes—inspector says "fill in" and goes—the water let out—workman returns to fill in—treads on pipes—"onward march" his only thought—filling begins—"filling bumps" on pipes—ramming begins—shaken joints—trench filled, all, perhaps, in twenty-four hours, especially if a quick-setting cement be used—a most dangerous and expanding material. Oh that it were not true, and more so where drains are inspected and approved by inspectors to local authorities. Yet we have to often retest such work with only one result—failure to hold water.

Have any persons in this audience or any other person ever heard of a local authority that has power, and that insists upon testing private builders' cement used for drains, or is there one authority that insists upon testing the drainage of a building by water after everything is completed, and all external forces and weights have found their permanent bearing? I know none, not even one, nor any statutory power.

Cause 7 applies in many cases—

(a) From improper form of joint.

(b) From the sockets and spigots of the pipes being so

CASEMENTS, SASHES, STAINED GLASS, LEADED LIGHTS.

highly glazed as not to form a proper surface to allow the cement and pipe to thoroughly adhere to make a permanent water-tight joint.

The only cement joint I know that will stand satisfactorily the water-test is this, *i.e.* the cement should be keyed at both ends, as at A and B, the whole space in the joint being filled in with cement without gaskin or other material, and my personal experience also proves that no sand should be used. The most important point at which the joint should be perfect is at A—*i.e.* between the end of the spigot and the bottom of the socket, a fact which is overlooked by many engineers who use or specify gaskin, &c. When the pipes are being glazed in the kilns they are stacked on end one on top of another, and where the socket and spigot touch the surfaces are unglazed, forming a natural key for the cement. If from careless stacking the ends are glazed they should be chipped.

Joints made with gaskin should be strongly opposed:—
(1) Because they disallow the most important part of the joint; (2) because they allow of a large amount of play in the line of pipes, allowing the pipes to "sag," thus breaking the seal between the glaze and the joint; (3) because they allow of inferior workmen making the joints; (4) because they will not stand any pressure, especially if subject to vibration.

Joints made with cement should be absolutely free and rigid, and drains with cement joints should be laid on a foundation which has no possibility of yielding or uneven settlement if it is intended they should remain watertight. If concrete be used it should be very fine, no part to exceed a $\frac{3}{4}$ -inch ring gauged about 6 to 1 of Portland cement (or stronger, according to soil), and should contain sufficient sand to cause it to consolidate in a solid mass around the pipes—in fact, to form a concrete pipe outside the stoneware pipe.

When recently removing some old drains where gaskin had been used and then the joints "collared" with cement, I found the collars in some places loose, and in others a little pressure enabled me to withdraw the spigots from the sockets. I have also found the same result where the part of the joint between end of spigot and socket has not been full but no gaskin used. It is not to be wondered at when the only seal is between the glaze and the cement.

When the cement used has been of the proper quality, I have no hesitation in saying that very many of the "failures" found upon retesting arise from the breaking of the seal or cohesion between this glazed surface and the cement, and this may arise from many causes tending to alter the position of the

pipes after first making the joint, either before the cement is permanently hard or at any future time, or from the contraction of the cement. It is most imperative that no cement be used for drains which show any signs of contraction, and that a little water as possible be used in its manipulation. These facts are proved by careful observation, which shows that the water oozes out between the cement and the pipe.

Some authorities assert that expansion and contraction in the length of drain causes failure, but I have no personal knowledge of such a result and cannot in any way conceive how the temperature in a sewer can so affect stoneware and cement. Perhaps this idea has been conceived along with the invention of elastic joints, such as mastic, but I cannot accept the theory without proof, which at present I cannot find. With a long stretch of imagination, I might figure some would-be sanitarian put expansion joints on a 4-inch cast-iron drain mile long.

To avoid several of these failures many patent joints have been produced, the chief principle in which is having some jointing material of an elastic nature, such as pitch or putty in positions. Some are very satisfactory if used in connection with cement. There is no gainsaying but that they are "avoidances," not "remedies." Cement-jointed drains are not too well established to be altered from general use; it would almost if not absolutely require an Act of Parliament. Grant this hypothesis, we have to try and make them perfect without resort to patent joints or patent pipes. How can this be done?

1. By having a perfectly rigid foundation or bed. The one way to obtain this is by levelling up on rock with suitable cement concrete, or in other soils by a sufficiently thick bed of Portland cement concrete, which should be thoroughly hardened and set before laying the pipes.

2. By carefully testing the cement to find its qualities, and selecting suitable material.

3. By instructing workmen, and employing only those who can be relied upon to properly manipulate the materials, and who thoroughly understand the causes which produce failure, not only at first testing, but at future tests in years to come.

4. By pipe manufacturers sending out pipes whose spigots and sockets are not glazed, the glazing of which can be materially altered by proper stacking in the "salt kiln."

5. By engineers, architects and local authorities clearly specifying, in detail, not only what has to be done, but pointing out what has to be avoided.

HIGHEST AWARDS:
EXHIBITIONS 1891-93-94-95-97.

Twice Awarded the Royal Photographic Society's Medal for
Architectural Photography.

The Architect.

THE WEEK.

THE London School Board originally obtained designs for buildings through competition. Then Mr. E. R. ROBSON was appointed architect. Afterwards he was selected as consulting architect to the Education Office. On Tuesday, in the House of Commons, Mr. LAMBERT, the member for South Molton, asked the Secretary to the Board of Education what length of time Mr. ROBSON had served as consulting architect to the Board of Education; whether he had received notice that his services would be terminated on September 30; was such notice due to his incompetence, or not, what was the reason for it; and whether, in view of appeals permitted by the Education Act to be made by the denominational managers to the Board of Education, he could take steps to secure that the highest expert assistance would continue to be at the service of the Board. Sir W. ROBSON, in reply, said that Mr. ROBSON has been engaged for eighteen and a half years as consulting architect to the Board of Education. His engagement will terminate on September 30. No question of the competency of Mr. ROBSON is involved. The Board of Education are making new arrangements to meet new conditions, and will, of course, take care that they are properly provided with expert assistance in the matters to which the question refers. We may assume that under the new conditions the office of consulting architect will for a time at least be onerous. In great many places the condition of the schools has fallen below the normal level, and the new authorities do not appear to be eager to approve of the expenditure which is necessary.

ALTHOUGH France is carrying out rigorous laws against religious orders, there is no intimation of any danger impending on the ancient cathedrals and churches. The elevation of M. BOESWILLWALD to the rank of officer in the Legion of Honour could be taken as evidence that in the official world enthusiasm for Gothic buildings is regarded as praiseworthy. His name has been long associated with the style, and he is known as the Gothic Pontiff. An architect of distinction, M. BOESWILLWALD is one of the professors of the Ecole des Beaux-Arts. But he holds a more important office, that of Inspector-General of Historic Monuments. As such he is visiting physician for every ancient church. Among his restorations was the great church of Carcassonne, which dates from the beginning of the twelfth century, and exemplifies the improvements which the Crusaders derived from Syria. It stands on the site of a Roman castellum, and among those who were engaged in its construction were SIMON DE MONTFORT and SAINT LOUIS. VIOLLET-LE-DUC wrote a treatise on the buildings, and M. BOESWILLWALD, who is supposed to inherit that artist's mantle, was charged with the restoration, which is recognised as successful.

New rules and regulations will have to be observed by candidates for admission to the schools of the Royal Academy in January. Candidates in the departments of painting, sculpture and architecture must be recommended by some artist, architect, or person of known respectability, and must submit, together with such recommendation, specimens of their work according to a prescribed schedule. These are deemed satisfactory the candidates will be summoned to attend on a fixed day at the Academy, and here have to pass a prolonged examination. Painters (e.g.) have to paint a head from the life in six days of four hours each; to make a drawing 2 feet high in six days of two hours each; and to make a design, from a subject set by the Keeper, in one day of 6½ hours. The tests for sculptors and architects will be equally severe. Candidates will also have to pass an examination in anatomy and perspective, or, if architects, in perspective and the history of architecture. Successful candidates will be admitted as students for three years, to be prolonged to five years on their passing a further examination. Gold and silver scholarships, of 40% each, for one year, will be given to the best candidates in painting and sculpture.

It will be remembered that a bridge at Uckfield collapsed in last May causing much inconvenience to people in the district. There is no doubt a new structure which would be capable of accommodating the increased traffic is desirable. But the cost would be about 25,000%, if not more. To raise so much money is not easy. The County Council, it appears, would be acting legally if they set up a similar bridge to that which fell, the cost being not more than 750%. It is considered that the local authorities should raise at least 5,000% towards a better bridge. The railway company would also gain by the improvement, but for the present they are judiciously silent, as if they considered the work was one which does not concern them. There is consequently an imbroglio which is caused by astute action all round. No more can be done at present than to obtain from the county surveyor, Mr. F. J. WOOD, plans and estimates for a wider Uckfield Bridge, and by the time they are ready there may be some agreement between the different parties interested in the improvement.

ARTISTS are always pleased when they see the labels on their pictures and drawings which are signs of "Sold." It is human to err, and supposing a label was affixed in mistake, can the artist claim compensation? A case of the kind was heard recently for the first time in the Westminster county court. Mr. G. C. HAITÉ claimed fifteen guineas damages from the Continental Gallery, Ltd., under the following circumstances. The London Sketch Club, of which he is a member, held an exhibition in the gallery, and it was arranged that 25 per cent. would be paid as commission to the proprietors. One of plaintiff's pictures was priced at eighteen guineas, but he agreed to accept fifteen guineas, and it was then marked "Sold." Afterwards it was found there was no buyer, the label having been affixed in error. The judge said Mr. HAITÉ was deprived of his chance of disposing of the picture, because it was supposed to be already sold. It was, no doubt, a mistake. But he considered damage was sustained, and judgment was therefore given for six guineas with costs, the property in the picture remaining with the artist.

UP to the time of the French Revolution Strasburg possessed a university, the Academy having been elevated to that rank by the Emperor FERDINAND II. in 1621. When Strasburg once more became part of Germany, after the war of 1870, one of the first acts of the municipal authority was to revive the university. This was a wise stroke in a political sense, and it was carried out in a manner which deserves all praise. A new district was created in which the university buildings are dominant, and from its position and character a stranger might easily suppose that the Emperor's residence was no more than one of them. As an institution the university may be said to be laid out on the most modern lines in order to be adapted to the requirements of our time. Care was taken, however, to provide means by which the university would be made to have those relations with the past which are always a necessity, if the tradition of civilisation is to be preserved. Ancient literature is as well represented in the libraries as in one of the old institutions. In the explorations which Germany has undertaken in various regions the claims of Strasburg have not been forgotten. Among other endowments, it has obtained rolls of papyri. One found at Oxyrhynchus, in Egypt, contains a large part of the "Iliad." This enables a comparison to be made with similar copies of other portions of the same poem. Professor REITZENSTEIN has been able to prepare an edition of the first book, and Professor PLASBERG has produced a version from another papyrus. They show the changes which the Greek language had undergone by the second century of our era. Various explanations are given, and the publications will be found to have great interest for philologists. What, perhaps, is most remarkable is the circumstance that HOMER once more asserts his binding influence between the old world and the new. We see in one of the latest educational institutions representing the close of the nineteenth century the text of the poet scrutinised with more exactitude than was possible with the Italians of the Renaissance, to whom the "Iliad" seemed almost as if it were a Divine revelation.

PAUL CHENAVARD.

ANYONE who is disposed to meditate on the mutability of things cannot find a more fruitful subject than the Panthéon at Paris. The name itself now sounds satirical, for the most ardent revolutionist could hardly consider the heroes of the first republic as gods. All the inscription tells us, it must be allowed, is that they were great men, "Aux grands hommes la patrie reconnaissante." When Louis XV. laid the foundation-stone of one of the piers of the dome, the building was to be a church. SOUFFLOT was the architect, and it may be remarked that jealousy was excited against him because the king condescended to perform the ceremony. In the course of the construction the walls exhibited signs of settlement. It was necessary to make many repairs, but in 1797 there were no less than 367 cracks to be counted. When the republican government resolved that the church was to be called the Panthéon and to serve as a souvenir of illustrious citizens, there was no doubt they were apprehensive of its failure in endurance. Men of science as well as architects were engaged in proposing remedies which would prevent a collapse.

On the restoration of the Monarchy the building was adapted to its original purpose, and an inscription was set up stating that it was dedicated by Louis XV. and restored (in an ecclesiastical sense) by Louis XVIII. The revolution of 1830 brought back not only the name Panthéon, but the intention of the revolutionists. In 1851 it became a church for a second time, and in 1885 it was once more converted into a Panthéon, in order that it might be used to contain the remains of VICTOR HUGO.

The decoration of the building corresponded with its alternate uses. The pediment is filled with sculpture by DAVID D'ANGERS, which has for subject France awarding laurel crowns to her great men. On one side Liberty bestows the wreaths, and on the other History records the names of the recipients. In the interior the dome displays a painting by GROS, *The Apotheosis of Saint Genevieve*. The lower pendentives or spandrels are filled with allegorical figures relating to NAPOLEON by GERARD. All the world is aware that the walls of the building are decorated by paintings, some of which illustrate the history of the saint who is the patroness of the city, while others represent various historical incidents. The pictures of PUVIS DE CHAVANNES, JEAN PAUL LAURENS, HENRI LEVY, LENEVEU, GALLAND, CABANEL, BONNAT and others are among the most remarkable of modern works. But few of the visitors, whether Frenchmen or strangers, who examine them are able to recall that they also exemplify the mutability which is inseparable from the building. For, if one noble scheme of decoration which was approved and adopted had been carried out, none of those modern paintings would have been undertaken. The majority among them are suggestive of ecclesiastical events, but the project which we are about to describe was of a different kind. Instead of the history of France it would have suggested the history of the world, with the First Revolution as the climax. The scheme is now forgotten, but it was undertaken by a great artist, and he had to bear all the consequences of its renunciation.

Our readers will remember that we published lately an engraving of the bronze relief which is in the French Chambre, and has for subject the visit of the Marquis DE DREUX-BRÉZÉ to the Constituent Assembly, when he was rebuked by MIRABEAU. As far back as 1833 the incident was proposed in a national competition for a great picture to be placed in the same hall. PAUL CHENAVARD, a native of Lyons and a member of a family of artists, who was then in his twenty-fifth year, sent in a design which would have gained the prize if the voting of the competitors was accepted. He was not successful, and the picture for the French Parliament House was never executed. Afterwards he exhibited another design which represented the scene in the Convention when the fate of Louis XVI. was decided. LOUIS PHILIPPE was annoyed when he saw it in the Salon, for in the grouping, his father, the treacherous PHILIPPE D'EGALITÉ, appeared between MARAT and SANTERRE, the brewer. The king ordered the removal of the design from the exhibition. CHENAVARD realised there was no likelihood of success for an artist who was loyal to revolutionary principles. But he was confident his hour would come, and he left France in order that he might

equip himself for one colossal work. His dream was to decorate the walls of the Panthéon, which in 1833 was no longer a church, and he was desirous to master the secret of all the great masters in Europe before he attempted to realise it. He spent fifteen years in the study. Then his preparatory toil was interrupted by the breaking out of the French Revolution of 1848 and the flight of the king. The painter joyfully returned to France. He explained his projects to LEDRU-ROLLIN, the Minister of the Interior, and it was resolved that the enterprise should be undertaken. He was promised a sum of 30,000 francs towards the expense of preparing his preliminary studies, but received only 16,000, or little more than half.

What is remarkable is not the extent of the contribution but the novelty of accepting CHENAVARD'S project. It related not to the history of Paris or even of France, but to the whole history of the world. The artist had become acquainted with the unfinished work of HERDER'S called "Ideas about the Philosophy and History of Mankind," which GOETHE considered was the best of the author's numerous works. To obtain his ideas HERDER was compelled to study Eastern as well as European literature. The task was so onerous, it is little wonder he was described as having Indian life-weariness as well as Hellenic youthfulness in his thoughts. He endeavoured to make out national and racial differences as having slight importance, and tried to represent humanity as a whole passing through various stages in order to attain a destiny which had yet to be revealed. With so vast an ambition HERDER could scarcely fail to be hazy. But his ideas are inspiring to some minds, and CHENAVARD'S was one of them. It was his purpose to convey HERDER'S leading ideas to Frenchmen as far as was practicable by means of the pencil.

The French people were then devoid of ambition to grapple with cosmopolite subjects, and least of all under the guise of art. Since 1848 they have obtained colonies and organised international exhibitions, but a universe which the French race did not play a prominent part in was little interest to them. They hold on by Rome, for they claim a relationship with the old masters of the world, at Greece on account of its arts and literature obtains some sympathy from them. But under no circumstances could the history of Greece be allowed to supplant the history of France.

M. CHENAVARD, after receiving the promise of his commission, set to work in developing his designs with enthusiasm that overmastered him. He intended to place on the walls of the Panthéon fifty grand subjects. He prepared eighteen of them, each being 11 feet by 15 feet and each sufficiently indicating the accuracy of detail to be expected from a pupil of INGRES. The titles of the completed compositions were as follows:—*Philosophy, History, Hell, Purgatory, Paradise, the Beginnings of Rome, Junius Brutus, Siege of Carthage, the Rubicon, Death of Cato and Brutus, End of the Roman Republic, Time of Augustus, Birth of Our Saviour, His Teaching, His Passion, the Christians in the Catacombs, Time of Attila, the Crusades, Luther at Wittenberg, Time of Louis XIV.* Although the whole of his scheme was not fully exemplified, it will be perceived that the subjects selected were closely connected with the history of civilization. The cartoons were drawn in black crayon. Some critics considered that the artist's genius was killed by an excess of study. We have said that he travelled to all the chief cities of Europe (including London) in order to examine pictures, and there was not a detail of any of the masterpieces with which he was unacquainted. His pictures by themselves were inadequate, he believed, to enable him to unfold the history of humanity on the walls of the Panthéon. He supplemented that diligence by poring over books on history, philosophy and theology, and he sought intimacy with those of his countrymen who were competent to discuss such subjects with him. As he used to say, "I will remain in my shell until I attain the wings of an eagle."

All his labours were unfortunately fruitless. The Republic had been transformed into an Empire, and LOUIS NAPOLEON was not disposed to insure that a commission given by LEDRU-ROLLIN should be faithfully fulfilled. The Panthéon was again used for religious services, and the *Siege of Carthage, the Rubicon, Luther at Wittenberg*

and the *Siècle Louis XIV.* could hardly be considered to be aids to devotion. His great cartoons became the property of the State, and some of them have found their way to the musée of the artist's native city. They cost France not more than 40¢ apiece. It was the intention of the artist to have his composition surmounted by a great frieze in which would appear the principal personages seen in action in the large paintings. Scenes like *Hell, Purgatory* and *Paradise* were to be circular mosaics. Some of the same form were also to represent abstractions, such as the development of Action and the Idea.

Although he had studied German literature, CHENAVARD did not forget the limits which divide writing from painting. He is said to have often expressed regret that he could not put more of HERDER's conclusions on canvas, but he was never tempted to go outside the province of painting. He is always objective, never subjective. In that way, although inspired by a German, he avoided all imitation of the methods of German painters. The conclusion that he derived from the study of the art of all schools was that the Italian was best adapted to monumental painting, and he worked as if he were to the manner born.

There were other designs on a smaller scale which were to be part of the decoration. Among them may be named the *Deluge*, the *Judging of Egyptian Kings after Death*, the *Death of Zoroaster*, the *Trojan War*, the *Death of Socrates* and the *Decameron*, in which the chief Italian poets are introduced. Probably, if the Emperor had endorsed his commission, PAUL CHENAVARD would have introduced several alterations in the subjects. It is an onerous task to devise a plan for the decoration of an immense building like the Panthéon. The attempts which were made to effect the decoration of the dome of St. Paul's suggest that even a part of a building may present difficulties which are insuperable. When mural decorations for the English Houses of Parliament were proposed, historians, ministers and others were summoned to the aid of the artists, and it cannot be now said that if all that was proposed was carried out, the result would be satisfactory. The connection between the different paintings could not always be manifest. Large allowances must therefore be made for CHENAVARD's scheme, which was produced in two or three years, although it had been the object of meditation for more than twenty.

We suppose the failure to realise it was partly owing to the acknowledgment which CHENAVARD made of his indebtedness to HERDER. If he had announced that his inspiration was derived from BOSSUET's noble discourse on universal history there would have been more likelihood of success. Although at the time there was talk about the brotherhood of nations, it was not probable the French would approve of the decoration of one of the buildings they most prized in such a way as would make them appear indebted to a German. HERDER was intellectually a citizen of the world; for a man who investigated Hebrew poetry and the popular songs of many countries, and was absorbed in the idea of universal man, could hardly be regarded as a Prussian. His thoughts were as much occupied with Eastern subjects as with those of Germany, and he deserves from his unworldliness to be considered as if he belonged to another sphere. But although Frenchmen occasionally, like BÉRANGER, talk about the holy alliance of peoples, their statesmen will never approve of such an extension of fraternity until the millennium arises.

After the failure to obtain authority from the Imperial Government to carry out his designs, CHENAVARD, like any other artist, returned to Rome, which is the recognised and most fitting refuge for men of great ambition who have suffered shipwreck in their schemes. He took up his abode in a humble house in the Transtevere. EDMOND BLAUNT remarked that CHENAVARD's head seemed to be cut out of a block of marble. It was large and powerful, and embodied all the exterior characteristics of genius. The brothers GONCOURT, who visited him in Rome in 1867, said that he had the head of an antique philosopher, on which was imprinted the sadness of old artists whose hopes are vanished. He was a great talker, but his voice, by its softness, suggested his position. They walked out together to see some of the ruins of Rome, and the painter spoke of his past as if the struggle had been victorious. He was not alone, and others agreed with him, that he was destined

to be the renovator of contemporary art, and the impression the conversation made on the visitors was a melancholy blacker than any aroused by the ruins among which they had wandered. A couple of years afterwards CHENAVARD proved he was still alive and able by entering as a competitor for a prize of 4,000¢ offered by the French Government. His design is in the Luxembourg, and it shows that his power was undiminished. But the Empire was then tottering, and art could not prop it.

There was no modern artist who was so sacrificing of himself in order to obtain fame. Unfortunately his genius is only exhibited in cartoons and in drawings. He was not as fortunate as COUTURE, who, although no less neglected, throughout his life, produced the *Decadence of the Romans*, which is in itself enough to prove his right to be considered as one of the potentates of the French school. France is always supposed to encourage her artists, and occasionally pictures are purchased for public galleries for sums far below their value. But the expenditure of 16,000 francs on a genius like CHENAVARD proves that cases can arise when the loftiest aspirations and unquestioned competency are unable to obtain recognition. He wished to become a painter of epic works, and by looking to the Government as his only patron he failed to gain the rewards acquired by far humbler men who simply sought to please the public.

If his designs were executed there would be more unity displayed on the walls of the Panthéon than at present. On the other hand, it was not to be expected that the treatment would be perfect if so large an undertaking had to be carried out by one artist. MASSON's series of paintings at the Invalides are not encouraging to those who wish unity should be supreme. At present the variety of the paintings is in keeping with a building which has no definite purpose, and they are object lessons which suggest what is appropriate and the reverse in the pictorial adornment of buildings.

DIM RELIGIOUS LIGHT.

THE "dim religious light"—a phrase which MILTON made immortal—was supposed by him to be caused by the stained glass with which church windows were richly dight. His experience is believed to have been derived from visits to Old St. Paul's. It would be unfair to the great poet to imagine he was not acquainted with many other Gothic buildings in England. MILTON, and most of his contemporaries, may have found some inconvenience in Mediæval churches when they tried to read their prayer-books. The type employed was not always clear. Indeed, it has been advanced that the increased area of the window openings which characterises the Perpendicular style in England was mainly due to a desire to enable people to make use of printed pages during services. CAXTON did not appear in Westminster until the end of the fifteenth century, and large windows were to be observed in earlier buildings. One of the reasons for the change in size was the increased power of the artists, by which they were enabled to undertake elaborate pictorial subjects. There can also be no doubt there was a tendency to arrangements which allowed the introduction of white glass. But what is remarkable is that it preceded rather than followed the adoption of printed books. At an earlier time prayer-books were not unknown, but very few people in an English parish were able to purchase an illuminated Book of Hours, and there would be little use in lending one to them.

The dim religious light was, however, a very ancient characteristic of temples as well as churches. The old temples were looked on as shrines to be only entered by priests and favoured persons. The few legends which have come down to us about crazy devotees remaining in Greek temples during a night reveal by the circumstances described that the sanctuaries were vacant. Although it was considered a crime to abstract an object from a temple, yet there were too many treasures deposited in them to allow of unrestricted admission. The enclosures were jealously guarded, and the existence in some of an *opisthodomos*, or rear division, proves that precautions were taken for the preservation of valuable offerings. The Greeks or Romans could not possess strong-rooms like

those in a modern bank, because they had not attained the necessary mechanical skill. But as royal treasuries were sometimes lined with metal plates, we may be sure the gifts bestowed on the deities were no less securely protected against thieves. The lighting of Greek temples is a subject on which it would be absurd to be dogmatic, but the general impression which the references to them make on the mind of a modern student is that the interiors excited awe, and that effect was not likely to be produced with a strong light.

The earliest Christian places of worship are usually thought to have been the catacombs. Afterwards it is probable the meetings were held above ground, and it may have been in public gardens. But the tradition of gloom long continued to exert an influence in the church. When basilicas and other large halls were made available for Christian worship the openings for light were perhaps not always obscured. Other means were adopted. There are statements in early writers which are presumed to mean that curtains were drawn at certain parts of the service, and those who officiated were concealed from view. It has even been asserted that the iconostasis in the Greek churches, and the chancel arches and screens in some western churches, are survivals of the old arrangements to express a mystery. Those structures were equivalent to a darkening of the church. The crypts and "confessions" in Gothic and Romanesque churches also point to a period when darkness was held to be an auxiliary to religious emotions, and therefore to devotion. To recall the times of persecution when the faithful celebrated their rites in the catacombs or on the tombs of the martyrs, a cave was excavated under the altar, says DE CAUMONT, in which were deposited the remains of Christians who died in the odour of sanctity. In Gaul, according to the same authority, the early Christian converts worshipped either privately in their own houses or together in crypts and retired places. The only example which has survived is the crypt of St. Gervais at Rouen, which is said to date from the fourth century. In it the body of St. MILON was interred. The churches of the fifth century in France were believed to be not only large, but even magnificent. The windows, however, were small, not more than 3 or 4 feet in height and $1\frac{1}{2}$ foot or 2 feet in width.

In foreign countries, where the light was often oppressive, means were taken to guard against its ingress. The Greek houses were dark. Pompeii, which was a place for repose, does not add much to our knowledge of ancient fenestration. The recognised discomfort of the sun's beams is suggested in all the old Italian churches. Yet we suppose few travellers would hesitate to acknowledge the feeling of relief enjoyed on passing into one of them from the torrid streets. All our modern notions about the efficacy of light as a sanitary agent were unknown in former times. In DANTE we find expressions which suggest a dread even of the light of Paradise, for he admits

Not long could I endure the ardent glow;
Yet long enough to see sparks burst around,
Such as we see from red-hot iron flow.

His combination of light and heat is suggestive of discomfort, and the manner in which the southern people sought to temper the fierce light which prevailed for several months. In all such cases we must not judge by the standard to which we are accustomed. In our dull climate we can bear with an area of glass which would be oppressive to the eyes of an old Italian. Even in western hospitals the admission of light is not feared. But a Greek or an Italian who spent the greater part of the day out of doors considered semi-darkness as reposeful. The dim religious light of churches was grateful to him. There was no need to use a prayer-book. It was an advantage to have the ceremonies veiled, as it were, by cloudiness, and if he could not see the preacher he was at least able to hear him. It was, therefore, easy for the custom to arise by which small windows were more necessary for churches than for ordinary buildings. In course of time by the power of association their use became identified with ecclesiasticism. We should also remember that in all ages men of gloomy dispositions have considered their rightful place was among the clergy. To them churches destitute of ornament, in which light was barely visible, seemed to be

the best adapted to contain sinners who were obliged to listen to discourses in which men were to be moved to terror. According to some inquirers, BRUNELLESCHI was the first of the Italians who dared to abandon the Gothic devices for restricting light by opening windows which were free from obstacles, and which removed the old auxiliaries to mystery. The experiment was made at the beginning of the fifteenth century, and may thus be said to be almost contemporary with similar efforts in the north of Europe to facilitate the admission of light. Only in some of the buildings of Venice was the old Eastern and Gothic tradition preserved.

It is not necessary for us to trace the advancement in Gothic windows. Too often the subject is treated as if it signified only changes in the form of tracery. Narrow windows for several centuries prevailed in England. Light was obscured by means of columns and arches, and, as sometimes happened, the stonework was doubled for the sake of artistic effect, so that the window became a small arcade of one or two bays. It cannot be urged that any inconvenience was suffered by the congregations. The services corresponded with those in Italian and southern churches. People were able to take part in them without opening their eyes, and, indeed, in many representations of saints we see the eyes closed or downcast, as if devotion were best maintained in that way.

The people in general could not have been dissatisfied if there was obscurity in the churches. In their own houses they considered small windows possessed many advantages. In disturbed times they helped to make homes more easily defended. They were opened in the walls as near as possible to the ceilings so that entrance from without might not be facilitated. This is evident from CHAUCER's description, where surprise is expressed that a window was so low as to be at the level of a man's breast. The Miller in his tale says:—

He cometh to the carpenteres hous,
And stil he stante under the shot window,
Unto his brest it raught, it was so low.

In shops or booths which were on the level of the ground the openings could hardly be called windows. During the day there was no frame with glass, and at night a shutter on hinges, which was fastened to the ceiling, was let down for protection.

The desire for light shown by Perpendicular windows in churches, and in such buildings as St. Mary's Hall Coventry, was also exemplified in many of the great mansions. The openings were extended until at length they became almost excessive, for buildings ceased to present the appearance of solidity which at one time was considered necessary. WOTTON must have had the weakness in his mind when he warned his readers against making a house all eyes, like ARGOS. There was no par more expensive or more ruinous, he said, not only from being exposed to the violence of the weather but on account of the "different and unsociable pieces, as wood, iron, lead and glass, and those small and weak." WOTTON seemingly favoured allowing some darkness in churches, for devotion, he said more required collected than diffused spirits. His suggestion was not adopted. English churches for the reformation were slow in coming, but after MILTON's time, when there was a call for them, it was not reckoned necessary that the lighting in order to be religious should be dim. WREN's London churches, by their large windows, enable the citizens to read their prayer-books and hymn-books, as HOGARTH has recorded, the industrious apprentice at his master's daughter were able to read out of one small volume. A new symbol was created and light was revered as the "offspring of Heaven first-born" and the "bright effluence of bright essence increate," which could nowhere be more fittingly introduced than in churches.

A New Roman Catholic Mission has been opened at Benwell, a suburb of Newcastle. A site for a church, school, and presbytery has been secured, and pending their erection Divine service is held in a temporary iron building, which will be opened by the Bishop-coadjutor of Hexham and Newcastle on Saturday next (to-morrow).

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.

THE fifty-fifth annual meeting of the Somersetshire Archæological and Natural History Society was held recently at Taunton. Mr. F. J. Fry, of Cricket St. Thomas, presided.

The annual report stated that since their last report forty-five new names had been added to the list of members. The loss by deaths and resignations had been thirty-three, and the total membership of the Society was 614. The balance of the general account at the end of 1901 was 113*l.* against the Society, and at the close of 1902 the adverse balance was 192*l.* The total cost of vol. xlviii. for 1902 had been 105*l.* The thanks of the Society were due to Colonel Sanford and Dr. Walter for illustrations. Since the last meeting their museum at Taunton Castle had been enriched by a large collection of natural history and other specimens, presented by Mr. C. Dillworth Fox, of Waikari, New Zealand. Consequent on the arrangement of the collections a substantial amount of work had been found to be necessary in the provision of additional cases and repairs. It had been further considered necessary for the preservation of the collections to provide for the warming of the building not included with the great hall in the original scheme. The estimated cost of this added to the adverse balance of last year 238*l.*, and the miscellaneous repairs would probably leave a total balance of some 340*l.* against the Society on the castle restoration account. An appeal for special subscriptions would be made next year. In connection with this year's meeting the Society had, through the kindness of one of its vice-presidents (Viscount Portman), conducted excavations extending over a period of two weeks at Castle Neroche, with a view of ascertaining the date of its construction. The Society's curator (Mr. H. St. George Gray) had been in charge of the work. The number of visitors to the museum during 1902 was 7,444, an increase of 47 per cent. on the previous year, due not only to the many improvements that had taken place, but from the fact of its being Coronation year and owing to the addition of the Walter collection.

The President in the course of his address said:—Our *vigilant opus*, our genial task, which I hope will afford much pleasure and interest, is to explore this neighbourhood. Somerset can boast of no clay tablets or cylinders, no baked bricks, with their imperishable record. We have no portraiture in stone of the old Somerset warriors, no beautiful terra-cotta reliefs such as those found at Susa, representing in blue, brown and yellow, as vivid as if they had come from the very but yesterday, Persian kings, priests and soldiers. But we have to be grateful that many invaluable documents, including the Saxon Chronicle and our Domesday Book, have escaped the ravages of time and the destroying hand of man, so that there are many old manuscripts which have still to be brought to light by antiquaries of the future. Amongst the most interesting historical associations with this part of Somerset are those connected with Charles I. and "King" Monmouth, and with Charles II., some of the villagers on the Somersetshire side of the Axe treasuring the memory of the flight of the king. Charles I. was twice in Chard—on July 24, 1645, when he lodged at the house of Mr. Bancroft, a London merchant, and again on September 23 with 10,000 horse and pieces of artillery. On the 20th of the month the king was at Lord Pawlett's at Hinton St. George. Chard had nothing to rue the day when, in 1685, Monmouth marched through the town, for did not Jefferies hang some twelve or more citizens after the Bloody Assize? In connection with Monmouth I may quote an interesting entry in 1685 in the registers of the church at Membury, on the Devonshire side of the border, which we are intending to visit to-day:—"John and Anne Diskett (?) were married by Vicar Crabb, the 11th June, the very day the traitor Monmouth and his rebels landed at Lyme regis the weddings were then out, and the people would wear no surplice a great irregularity, if not the able signs of a phanaticke, similis (?) simili gaudet." The aim of our Society is to illustrate the history of the past, and also calls our attention to the lessons which nature in various forms of beauty and life so prodigally provides for our enjoyment.

The members afterwards partook of luncheon at the invitation of the Mayor and Corporation of Chard. They then visited the parish church, grammar-school and court-house, and subsequently drove past the Snowdon Hill quarries to Quarry Church and camp.

In the evening a meeting was held for papers and discussion.

Sir Edward Fry (a vice-president) sent an exhaustive paper on "Somerset or Somersetshire?" He said the question of the word "Somersetshire" was a right word to use and depend on the usage of those who spoke and knew how to use the English language. If such persons had been in the habit, of long time, of speaking of "Somersetshire," then it would be dantry to reject it on any antiquarian or etymological ground. If, on the contrary, there had not been such a usage,

but the word had been lately introduced, or had never been habitually used by those whom they regarded as masters of English pure and undefiled, then they were entitled to expel it as a vulgarism or solecism. In a word, usage was the *"jus et norma loquendi,"* and must be decisive in this, and all like cases. Over and above this primary question there might remain another, as to the original propriety of the use of the word, but the two questions must not be confounded together. As to the usage of the word he said, without fear of contradiction, that it had been in use for many hundred years, and that for the greater part of those years its continuous use was apparent, and that throughout the whole of that period its continuous use was probable. Of the contemporary use of the word in question, whether in the popular or the literary language of the county, there could, he supposed, be no doubt. Sir Edward made a number of quotations to establish a long-continued usage of the inculcated word for more than eight centuries. They showed its use by men of the county and men unconnected with the county, by the literate and the illiterate, by antiquaries, historians and geographers. He must be an excessive stickler for antiquity who was scandalised by the novelty of a word used by the Domesday Commissioners of the Conqueror; he must be a purist or a pedant who was offended by a word used by such writers as Clarendon, Coleridge, Macaulay and Froude. At any rate, he (Sir Edward) thought his citations were enough to clear the memories of the founders of their Society from the charge levelled against them of not knowing the name of the county of whose history they were studious. There was strong reason to believe that Somerset was a shire before Oxfordshire or Gloucestershire ever acquired a title to that name, for the shire appeared to be originally a West Saxon institution, and Wessex seemed to have been divided into shires, whilst Mercia was divided into regiones or maegths. The names of the shires into which Wessex was early divided were derived sometimes from the principal towns within them, sometimes from the principal Saxon tribes inhabiting the district, and once at least from a local peculiarity. If the division of Wessex into shires was a single act, then, of course, Somersetshire was contemporary with the others; if it was a process which began with the heart of the kingdom in Hampshire, and spread thence to the remoter parts, it was not likely that Devon would have acquired its title of a shire at an earlier date than the nearer Somerset.

The second day's proceedings were devoted to excursions in the district of Chard.

The first place to be visited was Whitestaunton, where, by the kindness of Commander Elton, R.N., the interesting manor-house and beautiful grounds were inspected. The first object to attract attention was the Roman villa, the remains of which were unearthed in the grounds some few years ago.

The Rev. H. A. Cartwright, rector of the parish, gave a few particulars of the villa, a plan of which was shown by Commander Elton, and the foundations of which now only remain.

A move was afterwards made to Whitestaunton Church, where the rector gave a detailed description of the building, dealing particularly with its early history and its associations with the families of De Staunton and Brett. The present church, of Perpendicular style, and restored in 1878, was built between the years 1478-92, and probably succeeded a Norman building, the Norman font being still in good preservation. Attention was drawn to the beautiful little chapel of the lord of the manor, the rood-loft and staircase, and the remains of the rood-screen.

The Rev. F. W. Weaver, in thanking the rector for his interesting description of the building, said that they were all the more indebted to him as, although not feeling well, he had willingly given his services.

Mr. Buckle gave some supplementary particulars respecting the architecture of the structure, which agreed in the main with those given by the Rev. H. A. Cartwright. Mr. Buckle, however, was of opinion that it was a church which had been altered and rebuilt from time to time, and although now Perpendicular in style it would be rash, he said, to fix any definite date to the building as a whole. The bench ends were very curiously carved, showing great originality, and were apparently local workmanship. The manor-house was afterwards visited, the Rev. H. A. Cartwright explaining that it was built in 1577 by John Brett on the remains of an older building. The rector commented on the enormous quantities of stone which had been quarried from that parish, and a great deal of which was used in the construction of Forde Abbey.

The drive was then continued through the delightful scenery, which is so well known, to the extensive camp at Castle Neroche, situated 900 feet above the sea-level, and commanding a magnificent view of the country for miles around. In anticipation of the visit several excavations had been made on the summit of the camp by permission of the owner, Viscount Portman.

Mr. H. St. George Gray, the curator of the Taunton Museum, gave an interesting account of the result of these

excavations. Although several finds have been made, the spadework had not proved quite so satisfactory as was anticipated. Mr. Gray, who for some years was a pupil of that well-known authority on such matters, the late General Pitt-Rivers, quite upset all preconceived ideas as to the camp at Castle Neroche being of early British date, by declaring that, as the result of the excavations and the fragments discovered, he had come to the conclusion that it was an earthwork of Norman or Mediæval date, probably constructed during the troubled reign of Stephen. There was conclusive evidence, he said, in support of this opinion. He described the camp as a position of extreme strength, and, in conclusion, suggested that a small excavation fund should be opened in connection with the Society, so that excavations might be made each year in various parts of the county of Somerset.

The Rev. F. W. Weaver said that the members were most grateful to Mr. Gray for the trouble he had taken, *con amore*, and for the valuable information he had given on the subject.

The journey was resumed to Ilminster, where the old parish church was visited. Here the vicar, the Rev. J. Street, gave an entertaining and instructive description of the building, with its rich central tower, the choice stone-groined roof open to the interior, and the splendid Wadham Chapel in the north transept. Ilminster Church, which is Perpendicular in style, is considered to be one of the two finest cruciform churches in the county, the other being at Crewkerne. It is well known as containing in the north transept the tombs of the Wadham family, one of whom founded Wadham College, Oxford. As the weather continued showery, some of the party, after the inspection of the church, returned to their destination by train, while the remainder continued the drive to Dowlish Wake Church, and visited the Wake and Speke monuments. This concluded the programme for the day, Chard being reached late in the evening.

On the concluding day, excursions were made to Leigh House, a charming Elizabethan structure, Winsham Church, and afterwards to Cricket St. Thomas, where the president and Mrs. Fry kindly entertained the members to luncheon and were thanked for their hospitality.

The usual votes of thanks having been accorded to all who had assisted in the general arrangements, including the local committee, the proceedings, which despite the somewhat unfavourable weather had proved to be of a successful character, were brought to a close.

FREE LIBRARY, TAUNTON.

EIGHTY-ONE designs for the Carnegie Free Library which is to be erected in Corporation Street, Taunton, at a cost of 5,000*l.*, were sent in. The trustees recently offered prizes of 30*l.*, 20*l.* and 10*l.* for the best designs, and these have been awarded by Mr. J. S. Gibson, F.R.I.B.A., who at the request of the trustees was nominated as assessor by Mr. Aston Webb, R.A., president of the Institute of British Architects. First prize, Mr. A. Colbourne Little, 9 Gray's Inn Square, London, W.C.; second prize, Mr. J. Lindsay Grant, 2 St. Peter's Square, Manchester; third prize, Mr. Henry A. Crouch, A.R.I.B.A., 12 Gray's Inn Square, London, W.C.; fourth in order of merit, Mr. Alfred Gladding, A.R.I.B.A., Beverly, Stoney Lane, Moseley, Birmingham; fifth in order of merit, Mr. H. Dare Bryan, F.R.I.B.A., 38 College Green, Bristol.

Mr. Gibson reported that a bulk of the plans reach a very high order of merit. The trustees do not exactly approve of the front elevation of the premium designs, but Mr. Gibson pointed out that that was the last thing that an architect looked at, and the prizes were awarded for the internal arrangement of the floors, and particularly of the ground floor. The elevation of the first prize design is of Jacobean style, and provision is made for a vestibule leading into a large hall. On the right-hand side is a reference library, and then a lending department, while on the left are a magazine-room and a large news-room, measuring 34 feet by 24 feet. At the far end is a ladies' room, with a librarian's office and a work-room. On the first floor are two living-rooms and on the second floor three bedrooms, these being designed for the resident librarian. The usual sanitary arrangements are also provided for. It is, we are informed, improbable that the front elevation will be adopted, it being thought advisable to have a Tudor front in keeping with that of the municipal buildings on the other side of the street.

The conditions of the competition included the following:—

The free library is proposed to be erected upon a plot of ground with 70 feet frontage to Corporation Street. Prizes of 30*l.* for the design placed first in the competition, 20*l.* for the second and 10*l.* for the third will be awarded on the recommendation of an architect of repute, and a Fellow of the Royal Institute of Architects, who will be engaged by the trustees to act as assessor, and who shall see that the

designs so recommended faithfully comply with all the conditions set forth herein, but the trustees will not hold themselves liable for such prize or for any other remuneration whatever to the competitor whose design may be accepted until they have satisfied themselves by *bonâ-fide* tenders from approved contractors for the several works that the total expenditure in carrying out such design will be within the amount stated in these conditions. The premiated designs are to become the absolute property of the trustees. It is the present intention of the trustees to employ the architect to whom the first prize is awarded to carry out the work provided that the assessor considers the design worthy being executed, and that the author satisfies the Council as to his experience and ability. The trustees do not, however, bind themselves to adopt this course. Should such architect be so employed the prize will merge into the commission which will be at the rate of 5 per cent. on the actual cost of the work. The commission to include the cost of all sketches for approval and full and complete specifications, working and detail drawings, architect's estimates and superintendence and carrying-out the work as architect, and all his travelling expenses and attendance on the trustees. In case, after the detail drawings and specification are prepared, a tender cannot be obtained from a responsible contractor to complete the work according to the design for the proposed amount, the trustees shall be at liberty to discard the design, and the author shall be entitled to no premium or remuneration beyond the amount of half his prize. The elevation of the building must harmonise with the Tudor building used as municipal offices on the opposite side of the street, and the north elevation must be of stone.

THE BOWES MUSEUM, BARNARD CASTLE

IN every distant view of Barnard Castle the great mass of the Bowes Museum towers conspicuously over the rest of the ancient town, and is now one of the chief attractions. A correspondent of the *Yorkshire Herald* gives the following account of its creation:—

The late Mr. John Bowes, and his first wife, Bence Josephine Bowes, the Countess of Montalbo, besides their residence at Streatlam Castle, near the town of Barnard Castle, had a house in Paris, and, in fact, principally resided in France. They were both of them great lovers and patrons of art, and some time previously to the year 1862 had formed the idea of collecting pictures and other objects of art, partly for their own gratification, but also with the intention of founding a public museum. From the time of adopting this view they systematically set themselves to acquire examples which should be adapted for this purpose, in being representative of various classes, styles and periods of art. The question then arose where the museum should be. Their original intention was to locate it in France. The Countess of Montalbo was a French lady, and in the first instance thought of the country of her birth. Their original idea was to build the museum at or near Calais, within the Countess of Montalbo's own country, France, and yet looking towards England, the Bowes's country. They abandoned this idea from a consideration of the permanently unsettled state of politics in France. They thought there was less chance of revolutions occurring in England, in which the works of art might be injured, in England than in France. The result was that they ultimately decided upon Barnard Castle as being a town with which Mr. Bowes's ancestors had been connected for many centuries, and the nearest place of importance to Streatlam Castle. The foundation-stone was laid by the Countess of Montalbo on November 27, 1869, and the museum was formally opened to the public on June 10, 1892, by the late Sir Joseph Whitell Pease, Bart., M.P. The Countess of Montalbo died on February 9, 1874, and Mr. John Bowes on October 9, 1895, during the building of the museum, and both lie buried in the vault underneath the private family chapel at Gibside, near Gateshead. The total cost to the Countess of Montalbo and to Mr. Bowes of purchasing the site of the museum and erecting the museum, was something over 100,000*l.* The cost of the contents is never likely to be known, as imperfect records only exist of the details of the acquirement by the museum of the works of art now in the museum. The contents of the museum are insured for a very large sum—the value is probably three times the amount at the least. Mr. Pease bequeathed to the museum legacies amounting to the principal sum of 135,000*l.*, and a further contingent share of residue.

There has been a long and protracted delay in settling owing to the peculiarity of French laws, and the fact that Mr. Bowes married again; but from a recent public statement it would appear that not only will the legacies be paid but interest thereon. Therefore the total value of this munificent all told, cannot fall far short of half a million sterling.

During the building of the museum a large portion of the pictures which are now on the walls had been in great

First, during the siege of Paris by the Germans in the winter of 1870-71, and subsequently during the possession of Paris by the Commune, March to May, 1871. The pictures had been removed by Mr. and Mrs. Bowes from their residence, 7 Rue de Berlin, in the centre of Paris, to a distant part of Paris for greater safety in case of civil commotion. The house in which they were placed was in Rue Blomet, in the arrondissement of Vaugirard, a south-western suburb of Paris, and was surrounded by small cottages and market-gardens. The house was actually struck during the siege by a Prussian shell, which exploded, fortunately without doing any serious damage. The fragments of the shell may be seen in the picture gallery. The collections were preserved unharmed, but the gentleman who guarded them died afterwards from the effects of the anxiety and want experienced during that terrible period.

The museum is an edifice which, in magnificence of appearance and proportions, has few equals in the provinces. The style of the architecture is essentially French of the Renaissance period, and the building, as a whole, reminds one of the Louvre, in Paris. The façade is copied from the Hôtel de Ville, Havre, and is a fine example of richly-ornamented work, the corbels, cantilevers, capitals, pedimental windows, &c., being elaborately carved. The extreme length of the building is 300 feet. The central dome and turrets are carried to a considerable height above the main building, which has an elevation of about 85 feet. The principal entrance is 24 feet 6 inches high by 12 feet 6 inches wide, the doors being of iron. On the left of the porch are the arms of Mr. Bowes (three bent bows); on the right appears the cognisance of Mrs. Bowes (a white mountain, "Montalbo"); while over the centre, interlaced on a shield, are the letters B and M, the initials of the names "Bowes" and "Montalbo."

The floor of the entrance hall is of Italian mosaicwork, and along one side run two galleries of Craigleith stone, which are reached by a staircase of polished Peterhead granite, galleries and staircase being supported by twelve columns of Peterhead and Aberdeen granite.

Amongst the large collection of pictures are many by the hand of the museum—mostly landscape scenes in Savoy, &c. The collection of porcelain is very extensive—Chinese, Japanese, Dutch, English, French, German, Hungarian, Portuguese, Russian and Swedish; Chinese and French enamels, bronzes, earthenware, Delft, Italian, Della Robbia ware, majolica, sgraffito, &c.; stoneware, including "Bellarmine"; glass crystals, ivories, gold and silversmiths' work, &c.; also some excellent tapestries, all of which could only be done justice in a very lengthy and separate article.

From the windows of the museum a magnificent view is obtained, commencing with Deepdale on the west, embracing Arkendale, Scargill Moors, Barningham, and the "Stang" on the south, and extending on the east beyond Kirby Hill Church.

There are several points of analogy between this right royal seat to the nation and a more recent and also a more valuable one—i.e. the Wallace Collection at Hertford House, London, and the provinces and the latter to the great Metropolis, all of our "Grand Old Country." With respect to the donors, all Englishmen will heartily say "Requiescat in pace."

THE ORDNANCE SURVEY.

THE annual "report of the progress of the Ordnance Survey" to March 31, 1903, has been issued as a Blue Book (C. 1688). For some years past the Ordnance Survey has devoted much labour and attention to its small scale maps, and during 1902-03 marked progress has been made with them. The 1-inch map of the United Kingdom, with hills, has been completed. The amount of labour involved in its preparation is probably not generally realised. It takes about four to six months to make the hill-drawing from the field sketches, and from two years to engrave a sheet of the size of a full English sheet. There are 360 sheets of this map in England, 205 sheets in Ireland of the same size, and 131 sheets in Scotland of the same size. The intention is to have the map of the United Kingdom revised at intervals of fifteen years. At the request of the military authorities maps on a scale of two miles to an inch have been prepared to cover certain areas—notably the country between Salisbury and Portsmouth and the South-west of England. The four-mile map of the United Kingdom has been further advanced, the ten mile revised outline map of the United Kingdom has progressed rapidly, and the ten-mile map of the United Kingdom with hills is being proceeded with as fast as possible. The map on the scale of 1-1,000,000th, the smallest scale map which forms part of the Survey programme, has been begun. A new method of folding in covers has been introduced, which enables a map to be read without necessarily opening it fully. The amount of work, especially printing, done for other departments last year made the work of the Ordnance Survey somewhat less than otherwise could have been. Further efforts have been made to render

the maps of the Ordnance Survey more accessible to the public. Thus, the postal authorities have allowed a stock of folded maps to be kept for sale at certain post offices. It is too early to say how this has answered. As to printing, the use of the Vandyke process has been largely extended at Southampton and has been introduced at Dublin. It has amply proved its value. The report once more complains of an insufficient staff of officers.

THE NATIONAL PHYSICAL LABORATORY.

THE following statement on the work in the Engineering and Physics Departments during the half-year ended June 30, 1903, was prepared by the director and laid before the executive committee at their meeting on July 17, as an interim report on the research work in progress. The committee, believing it would be of interest to a wider circle, ordered it to be printed and circulated.

Engineering Laboratory.—In the wind-pressure research the case of flat surfaces exposed to a perpendicular current of air has been fully worked out, and a general relation established which is now being tested for the case of larger surfaces exposed to the natural wind. The case of parallel plates at varying distances apart has been treated, and experiments are also in progress on the pressure on inclined surfaces. Dr. Stanton hopes to have a paper on the results obtained at present ready for publication very shortly. The testing machine for alternating stresses is nearing completion, and will, it is hoped, be ready for working in the autumn. Drawings have been prepared and some preliminary tests made for the research into the constants of steam.

Thermometry.—Dr. Harker has continued his comparison between the air thermometer, the platinum thermometer and the thermojunctions, and the work is now complete for temperatures between 0 deg. C. and about 1,050 deg. C. The first part of the work for temperatures up to 500 deg. C. was done with M. Chappuis, at Sèvres, and the results have been published. Dr. Harker is now preparing for publication results up to temperatures of 1,050 deg. C. obtained at Bushy. He has also constructed and subjected to stringent tests a set of platinum thermometers for the British Association. A small research on the specific heat of iron at high temperatures—700 deg. C. to 1,000 deg. C.—is nearly complete and promises to be of interest.

Electricity.—Mr. F. E. Smith's research on the resistance of mercury and the construction of a standard mercury resistance is practically complete. Some ten or twelve tubes have been calibrated, and give results which will only differ among themselves by some few parts in 100,000. The value of the specific resistance of mercury will probably prove to be very close to that determined by myself and Mr. Fitzpatrick in 1888. On the assumption that the absolute value of the wire standards in the laboratory is known the length of the column of mercury, 1 sq. mm. in section, having a resistance of 10^9 C. G. S. units is found to be almost exactly 106.29 cm. The difference between Mr. Smith's results and those of the Reichanstalt will not be more than some few parts in 100,000. Mr. Smith has also made good progress with a research into some of the anomalies of the Clark Cell. An investigation of some importance into the changes in insulating strength of various dielectrics used in motors, transformers, &c., due to continued heating, by Mr. A. Campbell and Mr. Rayner, undertaken for the engineering standards committee, promises to lead to results of value.

Metallurgy.—In the metallurgical division preparations have been made for the work on nickel steel in conjunction with Mr. Hadfield; the material is being prepared by him. Meanwhile considerable advance has been made with a series of determinations on some iron carbon alloys. The solidifying points and cooling curves of a series of pure iron carbon alloys have been determined, using platinum platinum-iridium and platinum platinum-radium thermojunctions. The range of carbon is from 0.15 to 3.55 per cent.; the range of temperature from 1,502 deg. C. to 1,111 deg. C. on the thermojunction scale. About fifteen alloys have been made, the weight of each being about 4 lbs. The ingots have been analysed for carbon, sulphur and silicon. The percentages of the two last-named elements do not increase during the time needed for melting. Further, the ingots are satisfactorily homogeneous in composition. The apparatus for taking cooling curves by the differential method is in working order and the above-mentioned alloys will be examined in this way.

The director hopes that a number of important results may be published during the autumn. The equipment of the photometric-room is approaching completion. The main photometer bench which is being standardised at the Reichanstalt has not yet been delivered. On its arrival the director hopes to issue a special circular giving an account of the equipment and a statement as to the conditions of the tests and the fees.

NOTES AND COMMENTS.

PAINTERS have occasionally enriched the public galleries of their countries with presents of their own works. One notable example is the Turner Collection. It is doubtful, however, whether so varied and valuable a gift has ever been made as that which has been given to Holland by M. HENDRIK WILLEM MESDAG. He owes his reputation among his fellow artists in Europe as much to his *bonhomie* as to his talent as a marine painter. He has deservedly been successful, and he has employed a part of his wealth in bringing together a series of pictures of the kind which he personally admired. Every example in it is in some way connected with M. MESDAG, and is evidence of his peculiar taste, which, it is needless to say, was always exacting. His private gallery, with its 300 works, is therefore in many respects the most thoroughly representative of modern art which is to be found in all Europe. Amateurs and public authorities cannot escape from the influence of local obligations, but with M. MESDAG excellence alone dictated his purchases. This invaluable collection, which has been seen by favoured visitors in his beautiful house in the Laan van Meerdevort in The Hague, has been presented to the Netherlands Government on the condition that he is to be allowed to serve as its director until his death. When we say he purchased the paintings, it should be remembered that sometimes the price given for them was not in gold, but in the form of his own delightful works. The French school is well represented, for one of the foremost to encourage him some thirty years ago was J. F. MILLET, the painter of the *Angelus*, whose *Hagar* and *Ishmael* and *Fisher Girl* are among M. MESDAG's pictures.

WATER-SUPPLY is one of the needs of Australia. In New South Wales many of the stock routes are rendered useless through lack of water, and sometimes it is with difficulty the mail conveyances are kept running, for there is nothing which the horses can drink. It is therefore satisfactory to learn that artesian boring is generally successful since the Act was passed by the Sydney Legislature to facilitate operations. Applications under it have been received with such increased frequency that before long it may be found necessary to impose a minimum limit upon the area to be included in any one application, in order to guard against a possible too severe drain on the supply. Steps are being taken to carefully watch and periodically compare the flow from each bore, and to note the effect of new bores on older ones in the vicinity. The importance of observations cannot be overestimated, as although artesian boring is still in its infancy in Australia, the demands for the water will undoubtedly rapidly increase with the population, and it is well to avoid disappointments in the future as to the permanent supply likely to be secured from new bores in the vicinity of old ones. Artesian water will also have to be systematically analysed from time to time, in order that any change in its properties by exposure to aeration may be discovered and its applicability to various soils ascertained. Before capital is expended in reticulation and planting it is desirable that the chemist should be in a position to point out the probable effect of the water on the plants and soil. It is calculated that the cost of the supply has been about 1d. per gallon of the daily supply secured. One bore yields four million gallons per day, another three millions, but in some cases the results were not satisfactory.

THE use of straw in brickmaking is very ancient. A regulation about it was the ostensible cause of the departure of the Israelites from Egypt. PHARAOH's order to his taskmasters was, "Ye shall no more give the people straw to make brick, as heretofore: let them go and gather straw for themselves." . . . "So the people were scattered abroad throughout all the land of Egypt to gather stubble instead of straw." What purpose was served by the straw is uncertain. In some of the Eastern countries it is still employed. In Persia straw cut fine is mixed with earth, and when moulded the bricks are dipped in a vessel containing water and chopped straw. The absence of straw in

modern brickmaking is the best evidence that any advantage arising from its use is considered doubtful. An American inventor proposes to reintroduce straw, not in small pieces but in the form of an extract. He has concluded that what the Egyptians sought in an empirical manner was tannin, and they obtained it by soaking the straw in water. The effect, he ascertained by his own experiments, is to increase the tensile strength of the clay to make it more plastic and to diminish the shrinking. The clay is treated with water in which straw has been boiled. Various proportions have been tried, but the most satisfactory results are said to arise by the use of 2 per cent. tannin during ten days. All that is required is to keep the clay well moistened with water in which tannin is found, and the process can be performed in vats. The inventor it is said, proposes to sell clay combined with tannin Egyptianised clay.

CATHEDRAL SERIES: EXETER.—VIEW FROM SOUTH-EAST.

HIS MAJESTY'S EXCHEQUER AND AUDIT DEPARTMENT, VICTORIA EMBANKMENT.

THIS building, of which we give an illustration, occupies the last of the vacant sites on the Embankment, was erected by Messrs. PERRY & Co., Tredegar Works, Bow, for the occupation of the Exchequer and Audit Department of His Majesty's Government, from the design of Mr. ARTHUR F. BRIGGS, of 9 Queen Victoria Street, E.C., at a cost of about 35,000*l.* The plans, which will appear next week, are of a very simple character, consisting of front and back block of offices connected by a corridor on the east side, on each floor from which the very ample lavatory accommodation is approached. The area dividing the two blocks is of unusually large dimensions, being 60 ft. in length by 45 feet in width, many streets in London being of less width, the light to the offices consequently being quite exceptional. The front block contains the wide and handsome staircase, which is also fitted with a large electric lift. There are two basement floors, the lower one being used as muniment-rooms. The top floor of the back block is fitted up as dining-rooms for the staff, with kitchen accommodation.

RIVERFIELD, NEAR OXFORD.

DENHOLME, WALTON-ON-THAMES.—GARDEN FRONT.

THIS house, which has lately been completed, is situated in Oatlands Chase, and has a nice site of about two acres, with a very fine holly hedge as a boundary to the road, together with some fine trees in the grounds, of which advantage has been taken in laying out the garden. The house is placed at right angles with the road so that the principal garden front may be south-east, and is entered by a carriage court on the north-west, approached by a straight drive from it. The external facings are of purple grey bricks with red pressings, and the roof is tiled and has gables with stone parapets. The walls are purposely left plain, in order to give solidity and to form a good background for creepers.

The accommodation on the ground floor consists of a dining-room, drawing-room, billiard-room, and large alcove with writing alcove and external loggia, while the first and second floors provide thirteen bed and dressing rooms and three bathrooms, &c. The heating was carried out by Mr. EDWARD P. MILNE, of 15 Craven Street, Strand, the domestic hot-water supply and that for the radiator (though separate) being heated by MILNE's patent "Duplex" boiler in the basement. The house has been wired for electric light in anticipation of the current being shortly available. Most of the fireplaces were supplied by Messrs. BRATT, COLBRAN & Co., of 10 Mortimer Street, W., their patent "Heaped" fire having been largely adopted.

Mr. FRANK HAWKEY, of Surbiton, was the builder, Mr. WALTER E. HEWITT, A.R.I.B.A., of 22 Buckingham Street, Strand, W.C., the architect, who also designed and superintended the laying-out of the grounds.

THE BRITISH MUSEUM.

THE last return of the British Museum shows that during the year 1892 the collections were enriched by many valuable acquisitions. Among the rare English books are "An Hospital for the Diseased," published in 1579; "A Booke of curious and strange Inventions called the first part of Needleworkes," 1596. In 1591 a book of "New and singular Patternes and Workes of Linnen" was printed; it was followed by the present book, of which this is the only known copy. The designs are of Venetian origin. One of the foreign books purchased is the "Biblia Istoriat," the Bible translated into Italian by Niccolo Malermi, printed by Gulielmus, called Anima Mia of Piancerreto, at Venice, 1493. An earlier edition of this famous illustrated Bible, printed by L. A. Giunta, at Venice in 1490, was purchased by the Trustees in 1897. The edition now added to the library contains a large number of woodcut illustrations, in themselves of great merit, which differ entirely from those in the Giunta edition. Two other copies only of his edition are known, one in the Cabinet of Engravings of the Berlin Royal Museum, and the other in the library of the Prince d'Essling. Another is Claudio Merulo's "Toccate d'Intavolature," printed by Simone Verovio, Rome, 1598-1604. This is an interesting book both musically and typographically, since Claudio Merulo was one of the first composers who wrote specially for the organ, while Simone Verovio was the inventor of musical engraving. The Trustees have also obtained a Book of Hours, from St. Omer, early fourteenth century, which is a beautifully illuminated little volume, formerly in the library of John Ruskin. Every page has a tastefully-executed border, abounding with charming miniatures and grotesques. From the artistic point of view this is the most important acquisition of the year.

The Trustees have purchased a collection of drawings from Mr. James Reeve. It is distinguished both by choiceness and completeness. Mr. Reeve's connection with Norwich, his personal acquaintance with members of the school, and his intimate knowledge of its history and productions, derived from life-long study, have given him unrivalled authority on the difficult subject of Norwich art, complicated as it is by the existence of very numerous and skilful imitations of the style of the greater men. His collection has long enjoyed recognition as by far the finest of its kind. It includes examples of the work of those able and highly trained amateurs, distinctive of the Norwich School, who caught from its fine tradition unusual breadth of style. The capital feature of the collection is the set of 317 drawings by John Sell Cotman, the pre-eminent master in black-and-white and in water-colours of the whole school. The series includes representative examples of the artist's work in all the many phases through which he passed. Among the thirty water-colours, several of which have been reproduced in *The Architect*, may be signalled "Greta Bridge," perhaps the most famous of all Cotman's drawings, "Duncombe Park," "Mousehold Heath," "Postwick Grove," "Bamborough Castle," and "A Chateau in Normandy." But the artist's range and power are still better shown in the black-and-white compositions and studies, some of the finest of which are comprised in the section of twenty-three drawings in monochrome ash (Indian ink or sepia, with or without chalk or pencil). Among these may be specially mentioned "Breaking the Clod," "Dewy Eve," "A Shadowed Stream," and "Arches in the Cloister of St. George de Bocherville." The pencil and chalk studies and sketches amount to 264, the most notable group being a series in black-and-white chalk on grey paper, made in the last autumn of Cotman's life, during flood-time, as "The Wold Afloat," "Below Langley" and "A Storm of Cromer." Another set consists of small but masterly pencil copies after Turner, chiefly from the "Liber Studiorum." Groups of sketches made on or about Dartmoor, and of shipping on the Medway, may also be mentioned. Of the other members of the Cotman family, Miles Edmund Cotman is represented by six water-colours (three or four being of exquisite quality) and eighteen black-and-white studies; John Joseph Cotman, eight coloured drawings, two of them of large size and three in sepia or pencil; Anne Cotman, by a pencil study. The three water-colours by John Crome, the greatest oil-painter of the school, especially "Woodland Scene, Dunham," and "Waiting for the Ferry," are of particular importance, owing to the great rarity of genuine drawings by his hand. His style is also illustrated by six studies in Indian ink and two pencil sketches.

Two fine water-colours of English scenes and a black chalk study by Edward Thomas Daniell make an interesting addition to the important series, already in the Department, of drawings made in Asia Minor by the same original and able amateur. To other amateurs of great talent, Robert Leman and Thomas Lind, are well represented—the former by fourteen water-colours and two black-and-white drawings, the latter by seven water-colours and four studies in sepia or chalk. Of the better known members of the school, John Thirle contributes to the collection thirteen water-colours and one pencil sketch;

George Vincent, three chalk studies on brown paper (the only authentic drawings by this artist known to Mr. Reeve); and Joseph Stannard ten studies, chiefly of fishermen, in water-colours, six drawings of landscapes and of horses in coloured crayons, and four studies in black chalk or pencil.

The other artists are represented as follows:—John Berney Crome, one water-colour drawing; Robert Dixon, six water-colours and five monochrome or pencil studies; Joseph Geldart, four landscape studies in black-and-white chalks; Ebenezer Gerard, a water-colour portrait; Edmund Girling, two sepia drawings; William Howes Hunt, six studies of Yarmouth and neighbourhood in sepia or Indian ink; William Joy, "Wreck of the Killarney Steamer," in water-colours; Robert Ladbroke, two water-colours; H. B. Love, a water-colour portrait of J. S. Cotman, drawn in 1830; John Middleton, two landscapes in water-colours and one in black chalk; Henry Ninham, five water-colours and one monochrome drawing; James Sillett, three water-colour studies of flowers; James William Walker, six water-colours.

The total number of drawings is 481.

The second main division of the Reeve Collection consists of 702 prints, chiefly original etchings and lithographs. Thirty-six etchings by John Crome, thirteen etchings and four lithographs by John Sell Cotman, have been selected to complete the fine sets already in the Print Room, and make the Museum collection of their work rich in rare impressions and rare states. Other artists are represented as follows:—Robert Blake, thirty-four etchings; J. Brandard, one lithograph; Lucy Brightwell, forty-eight etchings; J. J. Cotman, three etchings and two lithographs; M. E. Cotman, forty-four etchings and twenty-five lithographs; F. J. Crome, eleven etchings; J. B. Crome, three etchings; Robert Dixon, nineteen etchings; Richard Girling, seventy-nine etchings; Edmund Girling, twenty-four etchings; S. V. Hunt, eighteen etchings; W. Howes Hunt, twenty-nine etchings; T. Lound, sixteen etchings; H. Ninham, twenty-one etchings and three lithographs; Alfred Priest, sixty etchings and two lithographs; Alfred Stannard, eight etchings; Joseph Stannard, eleven etchings and one lithograph; Mary Ann Turner, six etchings; Sir W. J. Hooker, fourteen etchings; Lady Palgrave, ten etchings; Lady Hooker, nine etchings; Mrs. Dawson Turner, eleven etchings; Elizabeth M. Palgrave, two etchings; R. H. I. Palgrave, nine etchings; F. T. Palgrave, two etchings; George Vincent, ten etchings and one mezzotint. Besides these there is a supplementary series of seventy etchings by minor artists and amateurs having a local reputation as members of the Norwich and Yarmouth schools, and the collection is completed by a set of twenty-one prints after J. S. and M. E. Cotman.

The Cheylesmore bequest is another invaluable addition. It consists of two separate collections—a collection of 7,675 mezzotint portraits, and a collection of 2,674 portraits of royal personages, principally of Queen Victoria and her family. The collection of mezzotint portraits was formed with the primary purpose of illustrating English history as completely as possible. To this desire was gradually added on the part of the collector an interest in the art of mezzotint for its own sake, leading him to enrich his cabinet with a good proportion of the finest and rarest examples in early or proof states and in the best preservation. Speaking generally, the fine examples are in the proportion of about one to every six or seven of those which are of interest simply as portraits. Taken together with the fine and extensive, though imperfect collection already in the Department, these picked specimens will form a series not to be rivalled elsewhere. The residue, though including a large number of indifferent impressions, is rich in rare portraits, and from that point of view forms a most valuable addition to the departmental collection. Two hundred and eighty-four English and seventy foreign engravers are represented.

The collection of Assyrian contract tablets has been increased by a collection of over 1,000. One circular memorial tablet of clay is inscribed with the name and titles of Gudea, the "patesi," or governor, of the city of Lagash (Shirpurla), in Southern Babylonia, about B.C. 2500. The text contains a dedication to Ningirsu, the city god of Lagash. This tablet was built into a pier in one of the buildings erected by Gudea at Lagash, and set in bricks of a peculiar shape which were made to fit round it. Another tablet is inscribed with a text recording the building of a house in the city of Ashur by Marduk-nadin-akhi, the chief scribe of Ashur-uballit, King of Assyria, about B.C. 1400. The text states that the house was built under the shadow of the temple of Marduk, and was provided with a well of fresh water and with numerous cellars and storehouses. The reverse of the tablet is inscribed with a prayer to the god Marduk, beseeching him to grant that the house may be the resting-place of Marduk-nadin-akhi, and that he may establish it fast for his sons and for his sons' sons, and for his seed and for the seed of his seed for ever. The tablet ends with a prayer that long life and prosperity may be showered upon Ashur-uballit, the king.

In the Department of Mediæval Antiquities the additions comprise a costly and interesting gold reliquary with covers formed of large amethysts, enclosing scenes from the Passion in translucent enamel, and a Holy Thorn said to have been given to a king of Aragon by St. Louis, who bought the Crown of Thorns from the Venetians, but the style is somewhat later than the date of his death: French work, about 1310; given by Mr. Geo. Salting, F.S.A. Another work is a remarkable portable altar, Rhenish work of the thirteenth century, hitherto in many well-known collections; the copper-gilt border of the front engraved with figures of saints, and set with ivory carvings of the Crucifixion and the Virgin and Child, while the back is filled with an inscription enumerating the saints and martyrs in whose honour the altar was dedicated. It was purchased at the sale of Sir T. Gibson Carmichael's collection.

Among the additions to the coins are thirty-eight bronze coins of the age of the Antonines, when Athens was no longer authorised by Rome to strike silver money. The special interest of the Athenian coins of this period lies in the fact that the subjects represented upon them are, for the most part, copies of statues mentioned by Pausanias and others as famous works of art at Athens in their own time. The coins are contemporary with Pausanias's travels, and are in many cases the only evidence we possess of the general scheme of several masterpieces of Greek sculpture mentioned by him.

An examination has been made of the large hoard of silver coins discovered at Colchester in July 1902, and sent for inspection as treasure trove by H.M. Treasury. The coins, which number 10,926 specimens, consist mainly of "short-cross" pennies of Henry II., Richard I., John and Henry III., together with Scottish coins of William the Lion, Irish coins of John, and a few foreign deniers. A tabular statement as to the hoard has been drawn up, and selections for the British Museum and other public institutions have been made. A small hoard of coins of King Alfred found at Stamford has also been examined as treasure trove.

It is pointed out in the report that the Egyptian galleries of sculptures on the ground floor have been repainted and re-decorated, principally on the lines of the well-executed decoration originally applied to the walls and ceilings when the galleries were built, but modified by the introduction of white in the wall-spaces flanking the windows, in order to secure better lighting for the exhibits.

ARBITRATION CASE.

AN arbitration inquiry began at Westminster on Saturday before Sir Benjamin Baker, sole arbitrator, to decide the amount payable by the Great Western Railway Company to their contractors, Messrs. S. Pearson & Son, Ltd., of Victoria Street, Westminster, for works in connection with the construction of the South Wales and Bristol direct railway from Wootton Bassett to Patchway, Severn Tunnel. The total amount of the claim is approximately 1,600,000*l.*, but the amount in dispute was about 500,000*l.* Before proceeding to an arbitration the claimants formally offered to accept, in order to arrive at an amicable settlement, the sum of 312,165*l.* less a cash rebate of 100,000*l.*, or 212,165*l.* net, it being understood that that payment was to be in final settlement of all claims by either party under the contract, whether for construction, maintenance or otherwise. The company's contention, broadly, was that the contract was one for the execution of specified works for a lump sum, and though there might be certain extras for contingent works executed during the progress of the contract to be added, yet substantially the amount to which the claimants were entitled under the contract had already been paid to them. The hearing was mainly occupied with a discussion as to the best way of presenting the accounts. No arguments involving questions of principle were entered upon, and after agreement that the accounts in the form settled upon should be investigated on both sides during the vacation, so as to crystallise the substance of the claim, the arbitration was adjourned.

AYR COUNTY BUILDINGS.

THE following letter has been addressed to the Ayr county clerk from the Scottish Office, dated July 29, 1903:—

Sir,—I am directed by the Secretary for Scotland to refer to your letter of the 9th instant and previous correspondence on the subject of the Ayr county buildings, and to inform you that after communication with the sheriff, and after a conference with the four members of Parliament representing Ayrshire constituencies, which was summoned at the instance of Mr. Orr-Ewing, M.P., and at which I also attended, Lord Balfour of Burleigh is in a position finally to determine what portion of the county buildings shall be appropriated as a court-house, in terms of clause 4 of the order scheduled to the Confirmation

Act of 1901. His Lordship has considered the representation made at this meeting, and again referred to all previous communications from the several parties interested in this matter. His attention has been particularly directed to the terms of the draft order as originally lodged, which ran as follows:—

4. "The County Council shall appropriate to the use of the Courts of Justiciary and of the sheriff, sheriff-substitute, sheriff-clerk, and commissary clerk, and sheriff's procurator-fiscal, the whole of the south half of the said County Buildings, including what are now known as the court-room, the jurors' room, witness-rooms, procurator's rooms, library, procurator-fiscal offices and sheriff clerk's offices, and shall further provide suitable accommodation for the sheriff of the county and his officials, which portion of the buildings shall hereafter be managed and maintained in accordance with the provisions of the Sheriff Court Houses Act, 1860, 23 and 24 Vict. chap. 79, and the Acts amending the same, viz.:—(The Acts 29 and 30 Vict. chap. 53, and 47 and 48 Vict. chap. 42.) The whole remainder of the said buildings shall be assigned to the use of the County Council for themselves, the Justices of the Peace of the said county and their respective officials."

This must be contrasted with the clause as finally adjusted in the statute, which is in the following terms:—

4. "The County Council shall appropriate as a court-house such portion of the County Buildings as shall be approved by the Secretary for Scotland in manner provided by the Sheriff Court-houses (Scotland) Acts 1860 to 1884, and such portion shall thereafter be a court-house within the meaning of the said Acts, to the same effect as if the said portion of the County Buildings had been a court-house erected or improved under the provisions of the said Acts, and shall be managed and maintained in accordance with the provisions of the said Acts, and the County Council may levy and impose the county house assessments accordingly."

The meaning of the clause as drafted and inserted originally in the provisional order is far from clear. It is obvious that the building cannot be fairly described as divisible into northern half and a southern half. Such a line of division would cut across both the room behind the central lobby on the ground floor and across the room above it. The list of accommodation to be appropriated to the court-house side contained in the clause is not exhaustive and cannot really have been supposed by anyone to be exhaustive, for the following words appear later in the clause—"and shall further provide suitable accommodation for the sheriff of the county and his officials."

It is now said on behalf of the County Council or their committee that the "main object" of the order was to secure possession of the three rooms acquired from the town of Ayr for the use of the county. Lord Balfour cannot doubt from the way this is put forward that it states what was in the mind of the promoters of this provisional order, but it does not alter the fact that that intention was not disclosed in text of the order as deposited.

The original clause having been struck out, and the new clause already quoted inserted in its place, argument upon the words contained in the original clause is futile so far as any practical purpose is concerned, and Lord Balfour has made this reference to the clause as drafted because its ambiguity raises no doubt in his mind that Sheriff Brand and as well as the county clerk and the other parties interested in the question have acted in good faith throughout.

The words employed lent themselves to a variety of construction, and different interpretations were, he believes, placed upon them by different persons.

I am now to revert to my letter addressed to you on the 9th ultimo, in which Lord Balfour intimated that, subject to any observations you might wish to make, it was his intention to lay the proposals as detailed in the letter from this office, dated December 9, 1902, before the Lord Commissioners of His Majesty's Treasury.

It is obvious that the scheme for adding to the accommodation available in the existing building by means of a new storey to which he inclined, has not found favour with those mainly concerned, and having regard to the views of the Office of Works in regard to it, Lord Balfour will not further recommend recourse to that expedient. It remains therefore for him to deal with the apportionment of the existing accommodation under the powers vested in the Secretary for Scotland under section 4 of this order as it became law.

After considering your observations as representing the County Council and the various representations already referred to, Lord Balfour adheres to his decision as to the use of the robing-room as follows:—

1. "That the County Council should have the first call on it for the stated days on which the district committee meets, and (2) that after that the sheriff should have the right to it for the hearing of appeals, and (3) that on dates not appropriated for the sittings of the district committee or for the hearing of appeals the use of it for county or court-house purposes should be decided by priority of application."

For the rest he awards the room at the back of the central

staircase on the ground floor to the court-house, leaving the two smaller rooms to the north of it to the county. This will secure for the court-house the whole of the accommodation to the south of the wall bounding the vestibule on the north—except the joint right to the robing-room to be exercised by the county. The Secretary for Scotland is satisfied that by this decision he is exercising the authority conferred upon him by clause 4 of the Confirmation Act in such a way as to provide sufficient accommodation for the necessities of the court-house as they now exist without unnecessarily limiting the space left at the disposal of the County Council.

He cannot but think that if the County Council utilise to its utmost capacity the accommodation left to them by this decision they will find there is ample scope for them to provide separate rooms for any number of committees of their body that are likely to meet at any one time, and so obviate the difficulties in regard to these matters, which have been most prominently brought before him.—I am, &c.,

(Signed) REGINALD MACLEOD.

The County Clerk, Ayr.

ELECTRIC WIRING AND FIRE RISKS.*

AS this paper is presented at a congress whose avowed object is to draw the attention of the public at large to the wholesome truths contained in the old proverb, "Prevention is better than cure," I think a few words upon the importance of sound work in the wiring of buildings for electric light and power will not be out of place.

Experience has shown that a building lighted by electricity enjoys complete immunity from risk of fire, provided always that the erection of the wires and fittings has been carried out in a sound, workmanlike manner, but that the keen competition amongst electric wiring firms, owing to the short-sighted policy of the owners of buildings who are apt to think more of first cost than of possible subsequent outlays, has acted as a powerful stimulant to "jerry" wiring.

It was foreseen at an early date in the history of electric lighting that one of the chief obstacles in the way of the popularisation of the electric light would be the cost of installation of the necessary wires and fittings. A reduction in the outlay for wiring a building for the electric light was quite as necessary a factor as the reduction in the price charged to the consumer for electrical energy, and as soon as the immense superiority of electric light over gas as an illuminant had become recognised by the public, the question of facilitating its introduction became a commercially important one, and the electric supply companies were obliged to do everything in their power to help forward the new industry, and therefore did not go out of their way to establish a high (and therefore expensive) standard of wiring.

It may possibly suggest itself to my readers that the existence of the many sets of rules compiled by the Institution of Electrical Engineers and other authorities render such a paper as this unnecessary; or, *per contra*, that my bringing before them a paper dealing with this subject is a tacit implication that such rules are incomplete, or inadequate, or capable of improvement.

I think, however, that, without falling into either of these alternatives, I may justify my paper on the following grounds:—

(1) Owing to their highly technical character the rules in question, widely known though they be, do not appeal to the very large class of users of electricity, so that the valuable principles involved and the practical lessons to be learnt from them are not sufficiently appreciated, and

(2) Owing to the important commercial principle alluded to before—namely, the necessity of stipulating the least extensive methods consistent with what appears adequate protection to the fire insurance company under ordinary circumstances—insurance companies and others have contented themselves with a standard which, though high and satisfactory as the event has shown—is still, I venture to think, below that which they would like to see adopted were they to have a hand in the design and equipment of an electric-light installation.

My experience for some fifteen years past has lain to a great extent in electrical matters, and I have made a study of the subject of electric wiring systems, and from the point of view of fire prevention I plead for even a higher standard than that which would satisfy the fire-insurance companies' surveyors.

I will now briefly deal with the more important features, in my opinion, are involved in an ideal wiring installation, having regard to the fact that my audience consists for the most part, presumably, of consumers of electricity rather than electric engineers, I will endeavour, as far as possible, to avoid what would sound to them technical jargon.

A paper prepared for the International Fire Prevention Congress C. de Segundo, A.M.Inst.C.E.

Close attention is required to the following points, and skilled supervision is essential in carrying them into effect:—

(1) The means adopted for insulating the wires.

(2) The means adopted to prevent mechanical injury to the insulation of the wires.

(3) The subdivision of the main circuit and the proportionment of the size of the conductor to the work it has to do.

(4) The means adopted to guard against accidental overloading of the conductor.

(5) The nature of the joints made in the conductors; if possible, no joint should be permitted between the terminals of the various pieces of apparatus involved.

(6) The design of the fittings with special reference to ease in wiring without injury to the conductor.

(7) The method of manufacture and erection of fittings and accessory apparatus (switches, fuses, &c.).

(8) The general scheme of wiring and method of fixing in place wires, casing or tubing, &c., and main and accessory fittings so as to avoid the danger arising from proximity to gas and water-pipes and ironwork of all kinds.

The above may be included in the statement that the essential condition of a properly-erected wiring installation consists in providing that the electric current be kept within its prescribed bounds, and that if, by any unforeseen contingency, a way should be opened for the current to travel in any unauthorised direction, the supply should be cut off automatically and instantly. No absolutely reliable means have as yet been devised whereby possible trouble due to electricity "out of bounds" can be guarded against, and the efforts of those who are working in the cause of fire prevention should be directed towards bringing about the adoption of the best kind of insulation and the most suitable kind of mechanical protection for the wires, supplemented by skilled labour and supervision by a competent man during the placing up of the installation; in other words, to teach consumers to trust to preventive measures rather than to so-called automatic "cures."

Rules are excellent in their way, but unmixed with brains in their application they are of comparatively little use, as circumstances frequently arise which call for modification of some one rule without departing from fundamental principles.

Conducting Wires.

The conducting wires should in all cases be copper having not less than the standard conductivity of 98 per cent. of chemically pure copper, and the size of the mains, sub-mains and distributing branch circuit should be calculated to carry the maximum current under normal conditions without any perceptible increase in temperature. With reference to the determination of the allowable rise in temperature of a conductor, I think the following definition is a practical one:—"By safety is meant that there shall be no perceptible heating of the conductors to the touch."

The standard of 1,000 units of current per square inch of sectional area of copper has been adopted as a safe one, provided the maximum current does not exceed 100 amperes; but to secure efficiency as well as safety it is necessary that this factor be controlled by a further provision that in no case is the drop in pressure from the root of any circuit to the extreme end thereof to exceed 2 per cent. of the pressure at the root. So far we provide against overheating of the conductor and against inefficient incandescence of the lamp, or unsatisfactory working of arc lamp or motor fed by any of the circuits as long as the current does not exceed that corresponding to full normal load. It is absolutely essential, however, to provide for such unforeseen contingencies as contact between wires of opposite polarity, or against a flow of current largely exceeding the normal from whatever cause this might arise. To effect this means are adopted analogous to the fusible plug which one has heard of in connection with steam boilers, and wherever a change of section of the conductor takes place a piece of specially made fusible wire should be introduced between the main conductors and the corresponding branch wires, this fusible wire being of such a size that it will melt and thus automatically cut off the current supply before the latter becomes large enough in amount to seriously raise the temperature of the conducting wires in the branch circuit or otherwise to set up a risk of fire.

This principle should be adhered to most strictly, and constitutes, if properly applied, a not inefficient safeguard against fire due to over-heating of conductors. Too much reliance, however, must not be placed upon fuses or cut-outs, for the following reasons. It is impossible to define the volume of current which does, or does not, constitute a risk of fire. In some cases a considerable current may leak across from one wire to the other, or away to earth, without causing any serious heating effect, whereas in other cases a leakage of current of an inappreciable amount has caused a fire. It depends entirely upon circumstances, upon the nature of the path by which the current passes, or, in some instances, one of which I am about to quote, upon circumstances which are entirely obscure. For instance, I have seen a lamp-holder (which held

a 16 candle-power lamp) with the cylindrical portion burnt right through and the contact plungers fused to the sides of the holder, but the 5 ampere fuse which protected this lamp circuit did not blow. What is even more extraordinary is that the heating was quite local. The flexible wires were not injured nor was the lacquer on the screwed cap of the holder affected.

The protection afforded by fuses therefore is at the best of a relative character. A concrete example may perhaps make this more plain. Imagine a circuit entering a building from the company's supply main and conveying current to a large chandelier which would require say 20 amperes. The fuse on this circuit would be designed to melt when the volume of current reached say 30 amperes. It is therefore clear that should any accidental partial contact between these mains take place, 20 amperes could pass from one to the other and constitute a very grave fire risk without affecting the fuse, because a fuse cannot act intelligently and differentiate between 20 amperes going where it ought not to go and 20 amperes performing the legitimate work of supplying the chandelier. If on the other hand this amount of electrical energy had been distributed over a number of lamps on different circuits, it is quite clear that by judicious subdivision of the circuits feeding these lamps the size of the fuses could at a very early period of the subdivision be reduced to such dimensions that the irresponsible action of say 3 to 4 amperes in any circuit would be sufficient to blow the fuse.

For safety against risk of fire one must depend entirely upon the means adopted for keeping the electric current within its designed sphere of action, namely, the character of the insulation of the wires or of the means adopted to prevent contact between wires of opposite polarity. This includes:—

- (1) The insulation on the wire.
- (2) The means adopted to guard against mechanical injury and damp.

For such wires as we are dealing with the material hitherto used as insulation has been mostly rubber, but to those having any knowledge of the rubber trade, the expression "rubber insulation" covers a very wide field indeed. Some so-called rubber insulation taken from electric cables has been found to contain less than 20 per cent. of rubber, the remainder being adulterants and pigments of all sorts and kinds, but which in a number of instances are found to exert a deleterious influence upon the character of the rubber mixture as an electric insulator. Up to the present nothing has been found to touch best quality rubber specially prepared to resist the oxidising action of the atmosphere, and the deleterious influence of any rise in temperature of the conductor.

Damp.

Damp is most insidious in its action, and every effort should be exerted and every means adopted to safeguard the installation from its evil effects.

Damp may arise from a variety of causes. In the case of a new building the moisture is often of an acid nature which, even when present to so small an extent as to be inappreciable by those living in the house, may entirely undermine the wiring installation in six months. I have in my mind a case where the wiring was carried out by a thoroughly responsible firm of contractors for a customer who did not stint them as to price. Inside of six months the insulation test showed a remarkable degree of deterioration, and an examination revealed the fact that the insulation on the wires had become quite rotten, and that in several places electrolytic action had so seriously diminished the sectional area of the conductor as to render the fuses absolutely useless as a means of protection from overheating of the conductors. To show how apparently slight was the extent of the damp, I may mention that in one room which was papered with a paper of a delicate pink hue no sign whatever of damp was noticeable, and the tenants of the house had never felt or discovered any evidence of damp, yet in this room a switch was absolutely corroded up, and copper carbonate had come through the holes in the base from the conducting wires and collected in considerable quantity on the bottom of the base.

This is an interesting but by no means isolated instance, and tends to show that rules alone are not sufficient, and that competent and intelligent supervision of the work is indispensable.

Were it possible I should like to see every wire in a house treated as if it were a submarine cable. Unfortunately, however, gutta-percha (though the insulator par excellence of a cable which is to be immersed in water and protected from the action of light and air) is useless for the wiring of houses: firstly, on account of its extreme sensitiveness to the oxidising action of the atmosphere and to the action of moisture and light; and secondly, because its softness and plasticity at a temperature only slightly elevated above normal renders it unsuitable mechanically. It is possible, however, that before long a new form of insulator may be introduced upon the English market, which, while possessing all the useful properties of gutta-percha, is practically indifferent to the action

of light and air, and is very much harder than gutta-percha. Large quantities of wires insulated with this material have already been used on the Continent with excellent results.

Mechanical Protection.

For mechanical protection various materials are superimposed on to the rubber covering according to the exigencies of the case. For the electric lighting of buildings, however, it has been found more convenient to use the wires containing comparatively slight mechanical protection and to run them through tubes, or in the familiar wooden casing, whereby the risk of accidental injury is reduced to a minimum if properly carried out. The ideal method of wiring a building, to my mind, is to use nothing but the highest class vulcanised or other suitable rubber insulation, with some suitable form of mechanical protection in the way of braiding merely to protect the wire from injury during its passage from the factory to the place at which it is to be erected, and to enclose the wires in a continuous system of cold-drawn steel tubes specially selected for smoothness of bore, with joint boxes inserted at all points necessary to enable the drawing-in of the wires to be carried out without injury to their protective covering and to facilitate inspection, withdrawal of any wires for the purpose, if need be, of increasing their size, &c., the whole system of steel tube and joint boxes being connected to earth. Such systems have been worked out in almost perfect detail by many firms making a specialty of this class of work, and when properly installed by competent workmen under skilled supervision, such an installation constitutes the best means, within my knowledge and experience, of securing immunity from fire due to electrical causes. Unfortunately, however, these systems have the disadvantage of being somewhat expensive as compared with the familiar system of distribution by insulated wires in American whitewood casing. But while there are millions of lights successfully and efficiently fed by wires protected by wood casing, and while I have instances in my mind of such installations, when properly carried out, being as good to-day as they were twelve years ago, still, when dealing with this matter from the point of view of fire protection, there is no sort of doubt in my mind that the system I have described above is the best and safest; and, indeed, the difference in cost is not so serious a matter as appears at first sight. In fact, in the case of a large building for the wiring of which I recently had to draw up a specification, I went into the question of alternative schemes of wood casing and steel tubing, wires of similar insulation resistance being used. The cost on the tube system was certainly not more than 25 per cent. greater. As this is a point of great importance, I have refrained from giving a schedule of prices, or of going into details of cost, but I hope that we may elicit some apposite remarks from those qualified to speak on this point, namely, the wiring contractors, who are, I think, pretty well represented here to-day.

BRITISH MUSEUM EXTENSION.

PLANS for a new wing of the British Museum have been on view in the tea-room at the House of Commons. They were shown in connection with the grant which Parliament is making for the extension. The cost will be about 200,000*l.*, and of this sum 50,000*l.* will be provided from funds bequeathed to the Museum trustees.

The present addition, says the *Daily Chronicle*, is part of a general scheme which will ultimately see the British Museum covering the whole area bounded by Great Russell Street, Montague Street, Montague Place and Bedford Square. The ground forming this block and not already occupied by the Museum buildings was acquired some time ago from the Duke of Bedford. An important step in its utilisation is represented by the plans which Mr. Henry Tanner, the architect of the Office of Works, has just completed. They concern the frontage towards Montague Place, or the northern side of the Museum. Here a fine block 380 feet long will be erected. This length does not cover the whole frontage towards Montague Place. Corner wings, as they may be called, like the white wing which was built twenty years ago to the south-east of the main building, will some day be added. The design of the new block is in harmony with the general scheme of the Museum which is Grecian. In the middle there will be a portico having Ionic columns, suggesting those at the front of the Museum.

The new building, when it has been erected, will be utilised in connection with the Museum library and exhibition galleries. It is to be of five storeys. There will be a basement devoted to storage, and then a sub-ground floor, which will be utilised for storage and also as receiving and packing-rooms. Next will come a ground floor of spacious galleries, and over it a mezzanine floor with a variety of rooms for general purposes and the use of students. Lastly, there will be an upper floor which will consist of galleries and further working space for students. Altogether the new northern block will be an

largement which is much needed at the Museum. A building has just been begun at Hendon for the housing of some of the accumulated newspaper files. As the treasures of the Museum increase, and the demands upon it by students grow, the cry, however, is always for more room. Naturally it will take a considerable time before the new block is ready, though the intention is that it shall be proceeded with expeditiously. Travelling-houses stand upon the site, and their occupants will have to find other homes as the ground is required.

The expansion alike of the Museum as a national collection and of the buildings in which it is housed has been gradual, if remarkable. It originated in 1753 with the purchase of the library and bric-à-brac of Sir Hans Busk, the Chelsea physician and antiquary. His dying direction was that his treasures should be offered to the nation for 20,000*l.*, two-fifths of what they had cost him. Montague House was acquired for their reception, together with the Harleian, Cottonian and other manuscripts. In 1759 Montague House was opened to the public. Between the years 1823 and 1852 it slowly disappeared before the existing structure, which was recently called for by the size to which the national collection had grown. No part of the British Museum is better known than the reading-room, with its lofty dome and endless shelves of books. It was built in 1837, and the new wing will indubitably be brought to the assistance of its many readers.

THE ECCLESIASTICAL COMMISSIONERS AND WESTMINSTER CLEARANCES.

THE subjoined statement appears this week in the *Guardian*:—"We have reason to believe that the following is a correct statement of the facts relating to the decision of the Ecclesiastical Commissioners—upon which many criticisms have been published during the past week—to reconstruct a portion of their properties in the immediate neighbourhood of Westminster Abbey:—Properties in Westminster held upon beneficial leases granted by the Ecclesiastical Commissioners' predecessors in title at small reserved rents have recently been, or will shortly fall, into the possession of the Commissioners. Among such properties were those comprising a block bounded on the east by Millbank, on the north by Great College Street, on the west by Little College Street, on the south by Wood Street. The leasehold interests in these, of which the leases had only short terms to run, were acquired by the London County Council in connection with the Westminster improvements scheme, and so much of the block was not actually wanted for the widening of streets was transferred to the Commissioners, to whom the freehold already belonged. The lease under which the Commissioners and their present offices has too short a term remaining to justify them in making the expenditure necessary to provide additional accommodation required, and the Commissioners have determined to use the block at Millbank for the purpose of rehousing themselves upon their own freehold. The whole of the site will not be wanted for the Commissioners' own offices. It is their intention to erect thereon a group of buildings consisting of offices for themselves and their agents and of other offices and chambers for letting. The buildings have been designed by the Commissioners' architect, Mr. D. Caröe, F.S.A., in the Renaissance style, and will not be unworthy of, or unsuited to, their situation in relation to the neighbouring public buildings. In addition to this block there are other properties in Great College Street, Wood Street, and the neighbourhood which have fallen into the possession of the Commissioners by the lapse of leases, and these are being relet upon long leases for building purposes. The old houses formerly standing on these sites were for the most part practically worn out by some length of time—while the sites upon which they stood have become increasingly valuable by reason of a demand for sites in this neighbourhood, especially for professional men attracted by the extension of Government offices in Parliament Street, Great George Street and other places. By letting the sites for building purposes the Commissioners, who are bound to the interests of the trust committed to them to develop the properties to the best reasonable advantage, have secured long terms rents certainly more than twice as large as the old houses to remain as long as they were capable of being relet. Of the houses that have been or are about to be demolished, none could fairly be said to have such historical interest as would make it reasonable in the circumstances for the Commissioners to maintain it, while many were decidedly out of both in appearance and in the uses to which they were put. The clearances have resulted in the suppression by the Commissioners of three fully licensed public-houses."

GLASGOW UNIVERSITY NEW BUILDINGS.

TENDERS have been accepted for the erection of the proposed extensions of the Glasgow University buildings, and the work is to be proceeded with at once. We are indebted to the *Glasgow Herald* for the following description of these important buildings, in which provision will be made for the departments of physiology, materia medica and forensic medicine and public health in one building, while another will be devoted to the department of natural philosophy. The entire cost, including equipments and fittings, will be between 90,000*l.* and 100,000*l.* For designs for both buildings a limited competition took place, and the plans submitted by Mr. James Miller, F.R.I.B.A., Blythswood Square, Glasgow, were selected.

The site for the medical building is on the south side of the main road, which extends from the front of the university buildings to the Western Infirmary. By reason of the varied levels of the site it has been possible to arrange the plan so that the second floor plan, the highest in the building, is in reality but one storey above the point from which it is entered. The plan is arranged with its main axis running east and west, and the disposition of the various wings or blocks has been so arranged that there is no overshadowing of the laboratories or classrooms. The physiology department occupies the lower ground floor and part of the upper ground floor plans in the west half of the building, while the other two departments are located in the east and south blocks. The lecture theatre for the physiological department is at the extreme west end of the building, while the theatres of the other two departments are at the extreme east end. Female cloak-rooms, with lavatory accommodation, are provided in every department. Each of the three departments contained in this building has its own independent entrance, and is absolutely self-contained, having no communication whatever with either of the other departments. In all cases the windows are made to run to the ceiling line, and throughout the building the stone butts between the windows have been kept as small as possible, in order to obtain the maximum of light and to obviate cross shadows.

The style of architecture adopted is a phase of modern Renaissance, selected chiefly for its ready adaptability to the requirements of the buildings, its directness and simplicity, and consequent economy in design. In no case has any portion of the plans been sacrificed in order to gain architectural effect, the elevation in every case being a direct outcome of the matured plan. Approaching the building by the roadway from the south-west, as the ground ascends the buildings rise in successive masses in sympathy with it, culminating in the dominant gable at the extreme east end. The rounded lines of the physiology theatre contrast with the straighter features of the main blocks, forming with these a picturesque and pleasant bit of grouping. The stone for the exterior will be white or grey rock, in keeping with the present university buildings. The roofs will be slated with undersized Elterwater or Buttermere green slates, the flat roofs being finished with concrete covered with asphalt. The floors of corridors and halls will be laid with terrazzo, forming a smooth, even surface, without joints of any kind. All stairs will be of stone. The walls of the physiological chemistry-room, as also of the chemical laboratories in the materia medica and forensic medicine and public health departments, will be tiled with white glazed tiles their full height. The walls of other laboratories and rooms will have tiled or enamelled brick dados 5 feet high, above which they will be covered with adamant or Robinson's cement, and these and the ceilings will be painted with "Ripolin," an enamel paint having a very hard and glossy surface which can be readily washed down. The lecture theatre and museum and cloak-room will have wood dados with adamant plaster above, as also the professor's private room, assistant's room, corridors, &c. All finishings throughout the building will be of the best quality of yellow and pitch pine, stained and varnished.

The lecture theatre of the physiological department is horse-shoe shaped, 48 feet wide by 45 feet deep, and capable of seating 200 students in loose order, or a working capacity of 250. The seating is formed with steep staging, the students ascending the back by a special stair and descending to their seats. The students' entrance to the building is at the back of the lecture theatre, and is approached from the road by a short pathway. Immediately on entering is a large students' cloak-room, with a large lavatory entering off same, both being placed under the rise of the seating in lecture theatre. The cloak-room would be fitted up with lockers and numbered pegs, accommodating 200 students. Adjoining the door to the cloak-room is the entrance to a circular stair 4 feet 9 inches wide leading up to the back of theatre seats. By this arrangement students can enter the building by their special entrance, pass into the cloak-room, and from thence by the circular stair to their seats in the lecture theatre, and pass out again without requiring to enter any other part of the building. Special study has been

given to the lighting of the lecture theatre. It is lighted from both sides, having two very large windows on each side. Additional light is also obtained from a large cupola in the roof, which, together with the windows, will make a brilliantly-lighted room, and in such a way that the light will not be glaring to the eyes of either the professor or students. The windows will be fitted with light-tight blinds running in special grooves, while the cupola will be darkened at ceiling level by means of a thick dark blind mounted on a roller and running on guides, and easily and quickly manipulated from the floor of the theatre. The whole when closed will render the theatre perfectly dark. Immediately adjoining the theatre on the north side is the professor's room, 18 feet by 15 feet. It is convenient to the main entrance-hall, and the professor can pass into the theatre from his room without requiring to pass through any public part of the building. The museum is 37 feet 6 inches by 35 feet, lighted on its longest side by three large double-light windows, and enters direct from the entrance-hall. Beyond the museum is the psychology department, consisting of a laboratory, 36 feet by 34 feet, and a lecturer's room, 27 feet by 14 feet, communicating. The position of these rooms is close to the museum and large classroom. An animal-room is placed in the area, and is entirely isolated from the main building, its door opening direct into the area, and one requires to pass out of the main building and into the area before it can be entered, thus preventing all smell from getting into the building. It is a well-lighted room, and, besides having a number of windows looking into the area, it has a very large roof-light, having louvred ventilators at the sides all round, affording perfect light and ventilation.

On the south side of the building is placed the physiological chemistry-room, 77 feet by 35 feet, lighted with large double windows in the front wall, with narrow stone piers. In addition to these, it has two large double windows in its north wall. It is provided with two large fume chambers, one at either end, each having a flue starting with a bell-shaped opening to carry off noxious gases.

The experimental-room, 76 feet by 35 feet, is placed with its long side facing north (this room requiring a more steady and equal light than the chemistry-room has been placed on the north side).

The histology-room is 100 feet by 42 feet, is lighted from the north side, and also from the roof. Special care has been given to the manner of lighting this room. The windows are large, and are divided by very narrow stone mullions, while the stone piers are reduced to the minimum width. The roof is formed after the type of the weaving shed roof, having the glass on the north side only, and at such an angle as will prevent the direct rays of the sun from entering the building (excepting, of course, in the early part of the day).

Throughout the whole of this department the greatest care has been bestowed on the lighting, not only of all rooms and laboratories, but also of all corridor passages and staircases.

The department of materia medica and therapeutics is entered by a porch and vestibule at the east end of the building. The students are provided with an entirely separate entrance when they enter the building and pass into the cloak-room and lavatory, and from thence up a special stair to the seating of theatre. A fume chamber is provided in the theatre with flue for carrying off the fumes. In front of the diagram screen a series of electric lights would be suspended on a horizontal rod, capable of being raised or lowered to any degree required. The lamps would be shaded from the eyes of the students by reflectors, which would throw the light direct on to the screen. Descending a few steps from the entrance hall is placed the pharmacy laboratory, 50 feet by 30 feet, lighted throughout its entire length and end and partly on the west side. Communicating with it is the preparation-room, 14 feet by 13 feet, and a large store, 21 feet by 13 feet, communicating with the preparation-room. The museum for students is placed at the end of the corridor; it is 27 feet by 23 feet, with large windows in the front wall, and having one in side wall. Between the museum and the store is placed a room for the preparation of specimens for the museum, 22 feet by 14 feet. Off the top landing of the stair are the experimental laboratory, chemical laboratory, with the balance-room placed between, all facing the east. The experimental laboratory is 30 feet by 25 feet, and has been placed at the corner so as to receive the greatest amount of light, being lighted on three sides (this laboratory has altogether 68 feet of continuous wall lighting). The chemical laboratory is 30 feet by 20 feet, with its longest side lighted throughout its entire length. A large store is provided near the chemical laboratory, with a service-room adjoining communicating with that laboratory. Communicating with the experimental laboratory is a large store or service-room. Next this is placed the assistants' room, being centrally situated to all the laboratories. Westwards is placed the pharmacy B.Sc. Laboratory, 50 feet by 27 feet; its position here is more retired, and greater quietness insured for the more advanced students. In addition to being lighted on its longest side, it has also a large double

window in the east wall. A small service-room or store is provided in connection with this laboratory, and having a door communicating.

The departmental museum and library is a large and beautifully lighted apartment, being surrounded with large double windows. It is L-shaped on plan, and contains 2,150 superficial feet of floor area. Its position is convenient, yet retired, giving that quietness which the purposes of the room demand. The narrow butts between the windows are just sufficient width to allow the ends of the cases to stand against them, the windows occupying the full width between. In the room, and in the four laboratories, the arrangement of plan adopted permits of a very large proportion of lighted wall surface; the windows being large, evenly and regularly spaced, give a uniformly diffused light to all these apartments. All rooms and laboratories have direct communication with the corridors, and in no case has one room been made the passage way to another.

The whole of the accommodation of the department of forensic medicine and public health (with the exception of the departmental museum and library) is provided on one floor viz. the second or top floor. This department, like the other is absolutely self contained. The plan is L-shaped, having all the rooms and laboratories arranged entering off a continuous corridor well lighted throughout its length—a form of plan which admirably lends itself to obtaining good light and access to every part. On the left of the landing is the professor's private room. The preparation and diagram-room and store immediately adjoin the lecture theatre. The entrance to the students' cloak-room is immediately at the top of the stair. Beyond this is the toxicological laboratory, 52 feet by 25 feet, lighted with its long side facing east, but also having windows on the south and west end, the total length of continuous wall lighting in this laboratory being 90 feet. A store-room is provided communicating with this laboratory.

The balance-room, assistants' room and service-room are placed on the south side of the corridor. The balance-room for convenience adjoins the chemical laboratory, and the assistants' room is central and convenient to all the laboratories. The balance-room will have stone shelves built in the wall in addition to being corbelled, and will be entirely insulated from all steel or iron construction. Beyond these is the laboratory for chemical, chemico-physical and meteorological work, 51 feet by 27 feet, and having a large double window in the end in addition to the front windows. The laboratory has also a north light in the roof throughout its entire length. A fume-chamber is provided in this laboratory. The laboratory for bacteriological, pathological and microscopic work is placed at the end of corridor. Its longest side faces north, and is lighted by four large double windows, while a very large window is placed in the end gable, which extends well up into the lofty open ceiling of the laboratory. In addition to the windows in the walls this laboratory is lighted from the roof on the north side throughout its entire length. In the laboratory is provided an enclosed incubation-chamber entered from the main room by means of an intermediate lobby, so that the door between laboratory and lobby would be closed before opening the door into the incubating-chamber, thereby preserving an equable temperature in the chamber. Next the incubating-chamber is placed a well-lighted store specimen-room. A fume-chamber is also provided in the laboratory, and also a space containing hot air and steam sterilising apparatus. The private research laboratory, 22 feet square, is placed in a projecting wing on the north side of the corridor, and has a north light. Its position is very central, and is convenient to the bacteriological laboratory. All gas in the fume-chamber will be controlled from outside the chamber, and a small electric fan will be fitted to the extraction flue, also controlled from a switch placed outside the chamber. The theatre, 36 feet by 34 feet, and is seated for 150 students. It is lighted by two large windows on the east wall, the windows extending the whole width of theatre. In addition to the windows on the east wall a large cupola is also provided in the roof, so that the theatre will be brilliantly lighted in every part. In no case are windows introduced in the walls immediately facing the professor or the students. On the top floor is also placed the departmental museum and library. In this position it obtains better side lighting, as it cannot be overshadowed by any part of the building, and it has also the advantage of roof lighting. It is situated immediately over the toxicological laboratory, cloak-room, &c., and is a fine apartment, 85 feet long by 25 feet wide, lighted all round by large double windows. The roof of this apartment is formed of steel and semicircular in shape. On the east slope of the roof roof lights are provided, the rays of light from the roof lights being more vertical than those from side windows, specimens in cases are seen to better advantage by their introduction. The lift at the staircase has been continued up to this floor to facilitate the transit of specimens, &c., to or from the museum.

The natural philosophy building has been designed to occupy a site on the north side of the road leading from the

front of the university buildings to the Western Infirmary. The building is three storeys in height. The lower storey or basement plan has its windows entirely above ground line, giving thereby light and ventilation equal to any of the upper floors, only a portion of the storey being sunk below ground line. The principal floor plan is approached by a handsome flight of steps in the centre of the main or south front, which leads into a commodious vestibule, separated from the main hall by a glazed screen with large double swing doors. Immediately on entering the vestibule is a small office or room for a hall porter, having a glazed front with inquiry window. Adjoining is a small waiting-room. On entering the hall, the corridor, 7 feet wide, runs east and west, having a leg at each end of about equal length running north and south, the legs terminating at the general laboratory on the one side and at the large lecture theatre at the other. Right and left of the main staircase two areas have been formed for the purpose of giving ample light and air to the corridors and staircase. The laboratories and other rooms are ranged along the corridors, every apartment communicating direct with the corridor. In the front wing right and left are the electric laboratory and chemical physics laboratory, both of which are 45 feet by 17 feet and lighted on two sides by large double windows. In the wing to the left or west side are ranged a large diagram-room, assistants' room, the latter being placed close to the general laboratory, the balance-room being placed between. The assistants' room communicates with the diagram-room, and both are amply lighted with windows the same as the laboratories, and both rooms are provided with open fires. The general laboratory, 60 by 40, is situated at the extreme north end of this wing, and is lighted from three sides with large four-light windows, and also from the roof by means of the weaving shed roof, where the glazed slope of the roof is placed facing north. The walls of this laboratory and also those of the theatre will be sufficiently strong to carry another storey if required. The side lights of this laboratory are sufficient of themselves to amply light the room in the event of an upper storey being built and the extension carried out at north end. Where roof lights have been adopted in the laboratories, lecture theatre, apparatus-room, &c., a 1½-inch hot-water pipe will be run round the roof lights at ceiling level to prevent condensation and also to obviate down-draughts. At the end of the corridor, just opposite the balance-room and projecting into the courtyard, is placed a secondary staircase connecting with every floor. The apparatus-room is placed at right angles to and running between the two side corridors, having double swing doors at both ends communicating with the corridors. The apparatus-room has a ceiling 15 feet high, with an average height of 18 feet at the cupola, and will be brilliantly lighted. This room is placed in a most convenient position with regard to the general laboratory and lecture theatre, the doors at either end giving easy service to these rooms.

On the right or east corridor are placed the professor's private room and private laboratory, the latter communicating with the preparation-room. Each of these apartments are lighted by two large double windows, the light being on the west side of the rooms, and both are provided with open fires. The preparation-room is well lighted on two sides, and, in addition, has a large roof light. It has a door communicating direct with the lecture theatre, and has also a large opening formed in the wall separating it from the theatre, directly in the centre behind the lecture-table, and having a sliding glass screen on both sides, thus forming an experiment chamber. By this arrangement certain experiments can be prepared for the lecture directly from the preparation-room, without requiring to go into the theatre. The floors and walls of the balance-rooms will be constructed in a strong and solid manner, and these rooms will have Caithness stone shelving supported on strong stone corbelling carried out from the solid wall, in addition to being built into the wall. This room will be insulated from all steel and iron construction.

The lecture theatre is seated in the most approved manner, the seats being arranged in circular fashion, thereby enabling the students to face more directly the lecturer or diagram screen. The staging for the seating is formed with graduated steps, so as to give every student a full view of the lecture-table. It is a brilliantly lighted room, having three large windows on either side (one of these on either side extends 13 feet above the floor to the ceiling line). In addition to the side lights, it has also a roof light. A service gallery has been provided, 34 feet long by 5 feet wide, for suspending apparatus, &c. This gallery communicates with a good-sized service-room on the upper floor, the service-room in turn communicating with the preparation-room below by means of a staircase and service stair; it also communicates with the grating spectrometer-room, thereby giving access to the other parts of the upper floor. The service stair in the preparation-room, together with the stair next general laboratory and the main staircase, give access to the upper floor at three distinct sections or points on the plan, thereby greatly facilitating communication between different parts of the building.

The students' cloak-room is a large and well-lighted apartment, fitted up with numbered pegs and lockers, and having hot-water rails for drying coats, &c. Keeping in view the probability of future extension, this building has been so planned that this could be readily and conveniently carried out with the minimum of alteration on the original structures. A large electrically-driven hoist is placed in the well of the staircase, and is arranged to serve all the floors.

The upper-floor plan is arranged precisely on the same lines as the principal floor. The front block contains the magnetic-room and small lecture-room for seventy students. The magnetic-room in its construction will be entirely insulated from all steel or ironwork. Communicating directly with the lecture-room is the diagram and preparation-room, adjoining which is the museum for historic apparatus. The private electric laboratory is placed at the south-east corner, and is lighted on two sides with large double windows. The west block is entirely occupied by the four special research laboratories, all provided with open fires. These laboratories have easy access to the back stair leading down to the general laboratory. Some of these research laboratories will be fitted with light-tight shutters, so that they can be darkened when required. On the opposite side of the corridor are the rooms for spectroscopy, photography, and dark-room. The photographic-room has a north light, with roof-light in addition. The east block contains the room for grating spectrometer. It is entered from the corridor by a small intermediate lobby for use when the room is darkened, and the windows would be all fitted with light-tight shutters, so that the light could be regulated as required. Beyond this room is the service-room for apparatus already described in connection with the gallery in the lecture theatre.

The arrangement of the basement plan is laid out on similar lines to those above, having corridors running completely round the building and communicating at the north end with the students' entrance and stair. By this arrangement the students obtain access to any floor of the building without requiring to make use of the main staircase or front corridors, and without requiring to pass through any of the laboratories or rooms. The corridors and stairs on this floor are as amply lighted as those on the upper floors, the arrangement adopted lending itself to the perfect lighting of every part. The west block is occupied by research laboratories, while under the chemical physics-room is a room for liquid air. A large room for electric work is placed below the electrical laboratory, and it has a large store communicating with it. The dynamo and battery-room is placed in the east block, being near the electrical laboratory. A large and well-lighted workshop is provided. It has a door leading immediately to the back stair up to general laboratory, and another door has been placed giving access to the front corridor, which would give convenient access to the dynamo-room. The remainder of the space on this floor has been given to research laboratories, of which there are ten in all. At the north-east corner is placed the boiler-house, as also the heating and ventilating apparatus.

TESSERÆ.

Concentric Circles in Decoration.

IN Egyptian ornament the use of concentric circles is comparatively rare. In border patterns they sometimes appear as the discs of the Khoker ornament, and seem to be a simplification of the rosette motive. On ivory and wooden objects, combs, &c., they form a more characteristic decoration, and the examples are fairly numerous. But, as a form of ornament, concentric circles are neither prominent in nor characteristic of Egyptian decoration. In Ægean and archaic Greek ornament, and generally the prehistoric ornament of Europe, concentric circles form a most marked and widespread feature. The fact that concentric circles are relatively rare in Egypt, that they do not appear to have ever been recognised as a decorative motive, argues that this ornament in Europe is not a loan as such from Egypt. This statement is confirmed and explained by the local tendencies in Europe to degrade spirals to concentric circles. The latter are, in fact, degenerate spirals. In Egypt artistic skill and decorative training rejected the lower and sustained the use of the higher form of ornament; in Europe a less developed stage of decoration and technical skill did not restrain the tendency to simplification, and the more complex form of the spiral was widely conventionalised to concentric circles. To illustrate the tendency of spirals to degrade to concentric circles examples may be cited even from Egypt. In addition to certain ivory and wooden objects on which true concentric circles are found, they appear occasionally on the scarabs as a substitute for spirals. Mr. Goodyear has published a series in which this transformation is seen. In the first instance, running spirals are simplified to concentric circles joined by tangents; then the tangents are

broken and the concentric circles set loose, portions of the tangents still adhering to them; finally the tangents drop off, and the ornament is reduced to concentric circles.

Sardinian Nuraggis.

The cyclopean structures called nuraggis, both by ancients and moderns, are very numerous in Sardinia, more than 1,200 of them having been found and recorded in the island. They are in height about 50 feet, and in diameter at the base about 90 feet. They are strong buildings in the form of a truncated cone, composed of masses of stone from 2 to 5 or 6 feet square, arranged in layers without cement. The materials are lava, freestone, porphyry, or such other substances as the respective sites afford; and they generally crown the summits of hills commanding plains, where they are seen in every state, some being nearly complete and others a mere heap of rubbish. On entering these edifices, which is effected by a low door, the structure is found to extend below the surface of the surrounding earth. The interior space is almost invariably divided into two floors, each consisting of a vaulted room, to which access is gained from a ramp between two concentric walls, and leading to the summit, where a flight of steps completes the ascent. The nuraggis are of two distinct kinds. Those which are the most common have no marks of the chisel, and are constructed of massive blocks with irregular faces, and smaller stones in the interstices; the materials of the others exhibit exteriors formed by tools, though the stones are not exactly square, but are placed with a stricter regard to keeping the horizontal layers, and gradually diminish in size towards the summit. There have been various conjectures respecting the probable object of these buildings. The darkness of their interior and the fragments of terra-cotta found in them would indicate their having been monuments for the dead—a belief so general that they have obtained in their neighbourhood the name of Domu de Orcu, or the house of death; but the pottery being evidently Roman, and in some instances accompanied by coins of the Lower Empire, indicates only that such was the use made of them at a late period. Captain Smyth, who examined these ancient monuments, says:—"From their laborious construction, their number and their general situation on curcreddus, or eminences, more or less distant from each other, I cannot but suppose they were designed to answer the double purpose of mausolea for the eminent dead and as asylas for the living, especially as many of them are flanked with smaller nuraggis having a subterraneous communication. But the mystery in which they are involved will probably remain impenetrable, since none of them exhibit the least trace of either literal or symbolical characters."

The Architectural Museum.

SIR,—The Architectural Association has now acquired possession of the Royal Architectural Museum in Tufton Street, Westminster, and has obtained from the Ecclesiastical Commissioners a new lease for 999 years, on most advantageous terms.

A contract with Messrs. Holloway Brothers for the necessary reconstruction to suit our requirements has been entered into, the amount of which is 8,440*l*. This expenditure is a considerable one, but the committee has felt that it is bound to make adequate provision for future requirements.

Donations and promises have been received amounting to about 4,500*l*, leaving a balance of 5,000*l*. still required to meet the building contract, furnishing and equipment.

In view of the importance of the work of the Architectural Association to the profession generally, I venture to appeal through your columns for further donations to assist us in meeting our liabilities. It is earnestly hoped that we may be able to enter our new premises free from debt.—Yours faithfully,

HENRY T. HARE, President.

August 10, 1903.

GENERAL.

The King has graciously accepted from the daughters of the painter the picture by the late Mr. H. T. Wells, R.A., entitled "Kensington Palace, Early Morning on June 20, 1837," which was exhibited in the Royal Academy in 1887, and is now on loan at the Cork International Exhibition.

The International Society of Sculptors, Painters and Gravers have been invited to arrange the British fine art section of the Düsseldorf International Exhibition to be held in that city next year. The Council has accepted the invita-

tion, and Mr. A. Neveu du Mont has been appointed delegate by the Düsseldorf Exhibition directors, and also representative of the International Society.

Sir Thomas Hanbury has purchased for presentation to the Royal Horticultural Society the estate and garden of the late Mr. G. F. Wilson, F.R.S., at Wisley, near Woking, which was much admired by all amateurs. The total area of the estate is 60 acres, part of which is used for agricultural purposes. There is a small residence, farmhouse and other suitable buildings on it. The garden has the variety of soil and aspect and the unfailing water-supply which are essential for the purposes of the Royal Horticultural Society, which will have but little to do but provide the necessary plant-houses.

The Earl of Rosebery has again been elected president of the Bucks Architectural and Archaeological Society, which celebrates the jubilee of its existence next year.

The Sketch Plans for the extension of the British Museum by the erection of a new block in Montague Place have been prepared by Mr. Tanner, principal architect of the Office of Works. They correspond in style with the architecture of the existing building.

Mr. Robert S. Peabody, of Boston, has been offered the position of advisory architect of the House of the Representatives office building in Washington.

The Home Secretary has stated that liability for compensation for accidents to workmen employed on buildings less than 30 feet in height is receiving attention in connection with the amendment of the Act now under the consideration of the Government.

M. Robert Mols, a Belgian painter of considerable reputation, died at Antwerp at the age of fifty-five last week. M. Mols is best known in England by his picture of the "Review at Spithead before the Crimean War," which was acquired by the Trustees of the National Gallery for 40,000 francs.

The Parliamentary Committee appointed to inquire into the barrack work of the Royal Engineers have presented the report, which will not, however, be published.

Mr. James Henry Cook, architect, of Liverpool, has passed from this life in his forty-second year. He had only recently returned from abroad, where he went in the hope to recover his health. His ability was shown not only in designing, but in literary composition.

An Obelisk of dark red granite, erected by Mr. Alfred Mosely, C.M.G., to the memory of Prince Christian Victor of the men of Devon, Gloucester and Somerset who fell in the South African war, was unveiled by Lady Audrey Buller of Plymouth Hoe on Saturday. It has been erected from the design of Mr. Fred W. Marks, architect, of London. The base is ornamented with four bronze panels. That dedicated to Prince Christian Victor is the work of Mr. Emil Fuchs, and the others are by Mr. Onslow Whiting. Two of the panels represent soldiers in action, while the third bears an inscription.

The Water-supply for the projected King's sanatorium at Midhurst has been completed. Sir John Aird & Co. have constructed two reservoirs with a total capacity of 220,000 gallons. The engineers are Messrs. John Taylor, Sons, Santo Crimp. Nothing definite is known as to when the erection of the sanatorium itself is likely to begin, but there is every reason to believe a start will soon be made. The preparatory clearing of the actual site has not yet been done, the work is put in hand shortly and the weather proves favorable, the foundations may possibly be completed by the spring.

The Total Sums voted in the estimates 1902-03 for the museums and galleries situated in London have been as follows:—Victoria and Albert Museum and Bethnal Green Museum, 66,994*l*.; Geological Museum, 3,558*l*.; British Museum, 128,729*l*.; Natural History Museum, 49,051*l*.; National Gallery, 18,600*l*.; National Portrait Gallery, 5,541*l*.; Wallace Collection, 9,066*l*.

The Nottingham Castle Museum committee contemplate the expenditure of 10,000*l*. on restoration and other works at the castle. The chief requirements are the restoration of the castle lodge (which has been in a dangerous dilapidated state for several years), the repair of the boundary walls, the building of an estate office for the Duke of Newcastle's agent, and the laying-out of the gardens to the southeast of the castle. The Corporation of Nottingham is obliged to carry out this work by the terms of the lease under which they hold the castle and grounds from the Duke of Newcastle.

The London County Council have informed the Board of Trade that, in connection with the reconstruction for electrical traction of their tramways, about 5,000 tons of rails of British manufacture and 10,720 tons of rails of foreign manufacture have been purchased by the Council. Previously to the transfer the company used about 1,000 tons per annum of foreign rails and none of British manufacture.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Aug. 31.—Competitive drawings are invited for new offices to be erected at the corner of Sefton Street and Dixon Street, Blackpool. The architect whose design is selected will be appointed to carry out the work. The competition is limited to architects having offices and practising within the water area of the Fylde Water Board. Mr. C. Arthur, 34 Victoria Street, Blackpool.

HEYWOOD.—Sept. 14.—Competitive designs are invited for library building to be erected in Church Street at a cost of £500. Premiums of 30%, 20% and 10% will be awarded for designs adjudged of sufficient merit and placed first, second and third in order respectively. Mr. J. Ainsworth Settle, Municipal Buildings, Heywood, Lancs.

HOWDEN.—Sept. 12.—Plans and estimates are invited for improving and extending the sewerage of the contributory area of Howden. The successful competitor will be awarded a sum of 15% and the usual commission for superintending the execution of the works. Mr. Henry Green, clerk.

IRELAND.—Sept. 30.—The Great Southern and Western Railway Company offer a prize of 20% for the best design and specification of workmen's cottages, built either semi-detached or in terraces. Mr. Francis Bl Ormsby, secretary, Knightsbridge Terminus, Dublin.

LEYLAND.—Sept. 26.—Plans are invited for the laying-out and development for municipal and other purposes of about 11,902 square yards of land in Church Road and Sandy Lane, Leyland, Lancs. A premium of 15% 15s. is offered to the author of the plan considered to be the best design. Mr. M. H. Wilkinson, surveyor, 21 Towngate, Leyland.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75% for design placed first, and one of 25% for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100%, 50% and 30% respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

SCOTLAND.—Sept. 22.—Competitive plans are invited for the erection of a hospital and offices. Conditions of the competition and full particulars may be obtained from Mr. J. E. Shaw, clerk to the Lunacy Board, County Buildings, Ayr.

SCOTLAND.—Plans are invited for a new higher-grade school to be erected at Fraserburgh for the accommodation of 650 pupils. Mr. Alex. Henderson, clerk to the School Board, Fraserburgh.

CONTRACTS OPEN.

ACTON.—Aug. 18.—For the erection of isolation hospital buildings at The Friars, East Acton. Mr. D. J. Ebbetts, surveyor, 242 High Street, Acton, W.

BARNSELY.—Aug. 19.—For the erection of latrines and outbuildings at the Park Road schools. Mr. Ernest W. Dyson, architect, 14 Market Hill, Barnsley.

BARROW-IN-FURNESS.—Aug. 22.—For alterations to the old municipal buildings. Particulars obtained at the office of the Borough Engineer.

BATLEY.—Sept. 4.—For additions to the town hall Messrs. Walter Hanstock & Son, architects, Branch Road, Batley.

GARRATT & CO

Leipsic Road, Camberwell, S.E.

WARRINGTON.—Aug. 17.—For rebuilding the church, Newchurch. Messrs. Travers & Ramsden, architects, 44 Church Street, Leigh, Lancs.

WARRINGTON.—Aug. 20.—For the erection of a glass roof behind the Crossfield conservatory, Bank Park. Mr. Thos. Longdin, borough surveyor, Town Hall.

WEM.—Sept. 14.—For the erection of a market house, assembly-hall, &c., at Wem, Salop. Mr. James Brown, architect, 12 Castle Street, Shrewsbury.

WIMBLEDON.—For the erection of two blocks of flats in connection with the Soldiers and Sailors' Families Association, Queen Alexandra's Home, Wimbledon. Mr. C. E. Lancaster Parkinson, architect, 44 Bedford Row, W.C.

WOOLMER FOREST.—Aug. 19.—For the erection of a terrace of ten six-roomed dwelling-houses at Whitehall, Woolmer Forest, Hants. Messrs. Rake & Cogswell, architects, Prudential Buildings, Portsmouth.

WOMBWELL.—Aug. 20.—For the erection of six houses, Hough Lane, Wombwell, Yorks. Mr. A. B. Linford, architect, Carlton Villa, Wombwell.

THE foundation-stone was laid recently of the new workhouse which the Hammersmith Guardians are building at Wormwood Scrubbs, in which ample accommodation is to be made not only for the able-bodied "wastrel," but for those whom disease has driven out of the ranks of labour. This is the first institution of their own which the Hammersmith Board have possessed, for hitherto their poor have found a home in the Fulham Workhouse. The new building, which stands on a site of 15 acres almost adjoining Wormwood Scrubbs prison, will comprise an infirmary with wards for 350 patients, capable of extension to accommodate 600, and a workhouse for 400 inmates, also admitting of enlargement for 800. It is being constructed by Mr. Thomas Rowbotham, of Coventry Road, Birmingham, from designs and under the supervision of Messrs. Giles, Gough & Trollope, of Craven Street, W.C., in accordance with the latest scientific ideas and with regard to the last recommendations of the Local Government Board. A notable feature in the preliminary work was the construction of a railway from the Great Western main line to the site about one and a half mile away. The amount of the contract is a little under 200,000l.

TENDERS.

BOURNEMOUTH.

For street works. Mr. F. W. LACEY, borough surveyor.

CONTRACT OPEN.

CAIRO.—Feb. 1, 1904.—For the construction of three bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

"FIGHTING THE FLAMES," the great sensational episode represented on the immense stage of the Empress Theatre at Earl's Court, has by dint of repeated performances reached to a degree of realism of which the show on the opening day, capital as that was, gave little promise. It now goes with admirable "snap" and sparkle, and shows off the dexterity of the men and the training of the horses to the greatest advantage. The history of fire-combating appliances as illustrated in the preliminary procession continues to stimulate the interest of the spectators, and the whole entertainment is evidently very much to the taste of the large audiences which assemble twice daily. In the grounds the interesting "side shows" attract numerous visitors, while among the beautifully-arranged *parterres* of flowers the music of the Grenadier Guards and the Hon. Artillery Company delights the many visitors.

NEW CATALOGUE.

THE St. Pancras Iron Work Company, Ltd., have just prepared a new edition of their catalogue of fire-escape staircases and general ironwork. A feature of these staircases is the new patent non-slipping tread, which consists of a slab $1\frac{1}{2}$ inch thick made of steel embedded in a peculiar manner in a special kind of concrete, on the wearing surface of which a series of lead rings is inserted. These slabs are made 10 inches from back to front and 12 inches wide, and half-slabs 6 inches wide. They drop into a rebate at the top and bottom of the adjoining risers, and the front edge is protected by an iron nosing. The illustrations in the catalogue show a number of staircases which have been supplied and fixed by the St. Pancras Company.

ELECTRIC NOTES.

THE Myrtle Street Baptist church, Liverpool, is closed during this month for improvements, including the installation of the electric light.

At a meeting of the Wednesbury Town Council, the town clerk announced that the Local Government Board had sanctioned a loan of £11,000 for electric-lighting purposes.

At the Bootle town hall, Mr. W. O. E. Meade King, M.Inst.C.E., Local Government Board inspector, held an inquiry with regard to the application of the Council for sanction to borrow £40,000 for purposes of electric lighting. The borough engineer explained that the sum of £40,000 was required for the purchase of additional plant to be installed at the electric-lighting station in Pine Grove. It was stated that this was necessary in consequence of the increase in the number of consumers, and to the fact that the output at the present time was very near the capacity of the plant. The amount mentioned would be expended upon machinery, buildings, mains, feeders and service-lines, and also on enlargement of the office and stores. Details of the works were furnished by the electrical engineer, and the inspector was informed of the success of the undertaking up to the present. The Council considered this as a sufficient justification for the further expenditure they now proposed to make. There was no opposition.

TRADE NOTES.

A CONTRACT for four electric lifts and two hydraulic lifts at the extensive new premises of Messrs. Robinson & Cleland, Ltd., Regent Street, W., has been awarded to Wm. Gibson, Ltd., 28 Fleet Street, E.C.

ST. PATRICK'S National Cathedral, Dublin, has been warmed satisfactorily by Maguire & Gatchell, Ltd., Dublin, with their improved hot-water apparatus. The triforium is specially warmed to prevent down-draughts of cold air.

MESSRS. HARTLEY & SUGDEN, LTD., Atlas Works, Halifax, inform us that they have now come to a satisfactory arrangement with their welders, who have now resumed work so that all orders can be promptly executed.

MESSRS. WM. POTTS & SONS, clock manufacturers, Guildford Street, Leeds, have received instructions to alter and fix a new illuminated hour striking clock and bell at Lord Grimthorpe's designs and plans at the Yorkshire Inebriates Homes, Cattal, near York. The work is now well in hand.

VARIETIES.

A NEW school, erected at the head of the village of a head, N.B., by the Crichton School Board, has been formally opened.

THE new Catholic day schools in connection with Oswald's Church, Old Swan, Liverpool, were opened by the Bishop of Liverpool (Dr. Whiteside).

THE new parish church at Shettleston, Glasgow, has been opened for public worship. From plans prepared by William F. McGibbon, architect, the church is of the thirteenth century French Gothic style of architecture, and is seated for 1,050 persons. An organ has been provided by the congregation.

A USEFUL little illustrated booklet for tourists is issued by the Brighton Railway Company, entitled "Holidays on the South Coast and the Isle of Wight." The utility of this little volume is vastly extended by their being printed in three languages—English, French and German—which appear column side by side.

DURING the excavations at a new building in Market Place, Stirling; the workmen came upon the remains of

lis at right angles to each other. They had been most substantially built, the walls being about 4 feet thick, and it is posed they formed part of the buildings in connection with Blackfriars Monastery, which extended to the north of site.

THE new church of St. Patrick's, Donabate, was dedicated Sunday by the Most Rev. Dr. Walsh, archbishop of Dublin. The building is in the Gothic style. It is cruciform in plan, a large nave, north and south transepts, semi-octagonal side chapels, sacristies and organ gallery. The tower, which stands beside the principal entrance, contains the belfry and is surmounted by a belfry. The building has been erected in accordance with the designs of Mr. George Connor, C.E., Dublin, by the firm of Messrs. Conolly & Son.

THE monthly report of the Association of Engineers shows the number of members is now 94,847, compared with 93,099 last month. Of these 3,078 are on donation, 2,053 on and 4,413 on superannuation funds, the corresponding numbers last month being 3,041, 1,940 and 4,376 respectively. Barnes, the secretary, intimates that, according to the rules of the Manchester rules, the representative meeting will take place at Newcastle-on-Tyne next Easter Monday, one representative being sent from each district containing 6,000 members. Manchester branches are included in three different divisions.

THE new technical schools erected by the Sisters of Mercy, common, were formally opened last week. The new schools have taken almost four years to erect. There are five storeys, in each of which there is a large schoolroom and classrooms, in which it is intended to carry on various branches of technical instruction. The building is rectangular in shape, and a raised tablet over the front of the third floor bears the name in Gaelic letters, "Technical Schools, Convent of Mercy, Roscommon. A.D. 1902."

THE new water supply at Margate, which has been carried out at a cost of over 120,000l., was formally inaugurated on the 6th inst. It comes from a spot near the village of Wingham, about sixteen miles from Margate, and the water is said to be of great purity. The engines and pumps provided are able to deliver 5,000,000 gallons per hour, whereas the maximum supply required for Margate during the height of the season is 1,250,000 gallons. Although the Corporation have powers to drive adits for three miles, an abundance of water has been found after going

1,200 yards that there is ample to provide 3,000,000 gallons daily, and further adit driving has been stopped.

BUILDING AND BUILDERS.

THE laying of foundation-stones of a new Congregational schoolroom took place on the 5th inst. at Farnworth.

AT a meeting of the Rugby Board of Guardians it was decided to proceed with the erection of a new Board-room and offices, at a cost of 2,136l.

IT is estimated that the new sewerage scheme of the Featherstone District Council, which comprises sewage works and a refuse destructor, will cost 12,622l.

THE Roman Catholic bishop of Liverpool laid on Sunday the foundation-stone of new schools in that city, which are to cost 8,000l.

A NEW Roman Catholic church now in course of erection at Tooting is to be dedicated as a memorial to the late Pope Leo XIII. Together with the adjoining schools it will cost over 5,000l. It will be opened during the autumn.

THE foundation-stone of a new Congregational church which is being provided by the churches at Lytham and St. Annes, in association with the Lancashire Union, was laid on Saturday.

DR. WALSH, archbishop of Dublin, has recently laid the foundation-stone of the new Catholic church of St. Columba at Drumcondra. The church is intended to be the parish church of the newly-formed parish of Drumcondra and Glasnevin, and it will occupy a position at the top of St. Alphonsus Road.

THE Manchester city architect has submitted to the housing committee of the Corporation designs for a large block of workmen's dwellings to face Sudell Street and Rochdale Road, abutting on an open space. The estimated cost of the building is 11,500l.

WITH Masonic ceremony, the memorial-stone of the new permanent premises for the Nottingham Gordon Memorial Home for Destitute Boys was laid on the 5th inst. The premises have been designed to accommodate seventy-two boys, compared with forty in the existing building in Peel Street, and the cost is estimated at 7,000l.

THE foundation-stone laying ceremony in connection with the building of the new corn market, to be erected by the Corporation at the Cattle Market, Southampton, took place on

NEW CATALOGUE FREE ON APPLICATION.

the 6th inst. The building, which will be 52 feet long by 32 feet wide, is being erected by Mr. W. Ward, contractor, 113 Avenue Road, to the plans of Mr. Crowther, borough engineer. It will be a one-storey building of red and white brick, with carved keystones, and with carvings of shepherds' crooks and sheaves of corn.

IN their plans for the extension of the Central station at Glasgow, the Caledonian Railway Company propose to erect a roof above the bridge across Argyle Street. The Corporation, by resolution arrived at nearly three years ago, restricted the height of the roof to 18 feet above the station platform, but the company desire the consent of the Council to heighten the roof to 54 feet, and at present negotiations are proceeding between the two bodies.

AT Ince on the 5th inst. the foundation-stone was laid of the new Urban District Council offices and public hall. The ground floor of the new building contains the following accommodation for the officials:—Clerk's office, assistant clerk's, overseer and assistant overseer, accountant, collector, medical officer, school attendance officer, nuisance inspector, pay office, &c., and behind a large public room 68 feet long and 35 feet wide, with retiring-rooms attached. The first floor contains:—Council chamber, committee-room, chairman's parlour, surveyor's offices and spare rooms, also waiting-room. In the basement are the living rooms for the caretaker. The general design for the exterior is in the Queen Anne style of architecture, with Ruabon pressed brick front and red terracotta dressings.

To meet the exigencies of the rapidly growing postal business of Oundle, Northants, a new and commodious post-office has been erected, and is now in occupation in New Street, to which it has a frontage of 25 feet in Weldon stone, with fluted columns and caps and mullion windows fitted with plate-glass lights. The back way for mails, &c., is in West Street. Though no pretence has been made to any particular style of architecture, the whole façade corresponds well with adjoining properties and the buildings of the town, the interior has been well fitted up, and everywhere the most has been made of the available space. Messrs. Siddons & Freeman are both the designers and builders.

AT an adjourned meeting of the Aberdeen Town Council the question of building a city hall was discussed on a motion by Mr. William Cooper, who wished a remit to the finance and improvements committee to consider and report as to the

advisability of utilising Exchequer Row area for the erection of a public hall suitable for accommodating large gatherings of the citizens for public meetings and other purposes. The principle of a city hall appeared to meet with general approval, but objection was taken to limiting the site to Exchequer Row—the area in the east end that was cleared under a provision made in 1861, and order several years ago. Mr. Taylor, who moved the proposition, objected to a policy that would coddle the people and destroy private enterprise. On a division the motion was carried by fourteen to eleven for the previous question. At the close of the meeting Bailie Esslemont gave notice of a meeting of a motion widening the remit, and not limit the committee to the consideration of this particular site.

LIVERPOOL BUILDERS AND THE TRADES COMMISSION.

THE following correspondence has taken place:—
9 Liston Street, Walton, Liverpool.
July 13, 1903.

To the Right Hon. A. J. Balfour.

Dear Sir,—I am directed by the committee of the Liverpool and Vicinity Building Trades' Federation to forward to you the following resolution passed at their last meeting:—"That we protest against the appointment of the Trades Commission, being calculated to hinder the early settlement of the objection, and in addition to this fundamental objection we are against the composition of the Commission, which includes a majority of members already publicly committed to a course of action in relation to the subject they have to examine and report upon, while it also contains a representative of organised employers, but no representative of the ordinary workers, and is therefore neither impartial nor judicial."
I remain, yours truly,

J. CONNOR, Secretary.

[Reply.]

10 Downing Street, Whitehall.

July 15, 1903.

Dear Sir,—Mr. Balfour desires me to acknowledge the receipt of the resolution which you forwarded to him, and in reference to the composition of the Trades Disputes Commission, and in reply to call your attention to the answer given upon the subject in the House of Commons on Thursday, July 2. A copy of that answer is enclosed herewith.—I am, yours faithfully,

WILFRED M. SPENCER.

"1. I am aware that various opinions have been expressed in connection with the appointment of this Commission. I have more than once explained the nature of the choice open to the Government in determining whether the Commission should be large and representative, or small and specially qualified, and the advantages which appear to attach to the latter alternative. Although I should have no objection to a temporary Commission's vote being discussed if time allowed, I am afraid that in the present condition of supply I cannot give no pledge on the subject.

"2. The hon. member cannot, I think, be aware that the Royal Commission has been formally appointed. It is not possible now to reconstruct the Commission, and by a large majority to its members, whether of trades unionists or employers of labour, to change the whole basis of its constitution.

It was resolved by the committee that this reply be put on the table in the waste-paper basket.

WOLVERHAMPTON'S NEW WORKHOUSE.

A new workhouse at New Cross, Wednesfield, about two miles from Wolverhampton, which has been in course of construction for the past three years for the Wolverhampton Union, is rapidly nearing completion, and is expected to be occupied next month. The old workhouse was erected about seventy years ago, and although additions have been made to the buildings and other premises rented for the use of the poor, people who had to seek the assistance of the poor-law authorities, the Local Government Board for years advised the Guardians to erect a new building. A plot of land containing 12 acres at New Cross was purchased for £11,128, and Mr. Arthur Marshall, of Nottingham, was engaged to prepare plans for what the Guardians now style "the new homes for the poor." The contract for their erection was entrusted to Messrs. Fish & Son, of Nottingham, the tender amounting to £8,791. This sum only relates to the buildings, and when the cost of the furniture, road-making and other items have been added, it will be found that the cost of the new homes will reach at least £200,000, a far greater sum than the Guardians originally proposed to expend. Of the 50½ acres, 12 acres have been covered with buildings, which have been designed on the block principle, and will provide accommodation for 1,246 inmates, twenty nurses and sixty other officers.

But although the buildings have not yet been opened, it has been stated that, owing to the increase in the number of paupers, additional accommodation will have to be provided at no remote period. The total number of buildings is thirty-one, of which the chief are the administrative section, comprising eight blocks which are connected on the ground floor by enclosed corridors, the roofs providing means of communication between the upper wards. In the centre of this collection of buildings is the residence for the master and matron, the assistant master, clerks, chaplain and other members of the staff. There is a dining-hall capable of seating 800 people; adjoining are the kitchens, sculleries and stores, while abutting upon the central block are three-storey buildings for each sex, a nursery and quarters for sixteen married couples. At the rear of this block is the infirmary, with space reserved for extensions, and there are provided quarters for the medical officer and nurses. Three blocks will be utilised for males and the same number for females, and contiguous are the dispensary, operating and consulting-rooms and a lying-in ward. Still further to the rear is another block designed for the use of the imbeciles, separate quarters being provided for the epileptic patients. Two hospitals for special diseases and an isolation hospital are placed still further to the rear of the main buildings. A nurses' home has been erected to accommodate forty. These are fitted in the most up-to-date fashion. A laundry, workshops for blacksmiths, tailors, tanners, carpenters, mat-makers and wood-choppers, with the labour master's house near by, have been provided. The whole of the buildings will be lighted by electricity, which will be supplied from a power-station situated near the centre of the grounds. Two entrances have been made from the Wednesfield Road. Near the main entrance are the porter's lodge and the board-room and offices, and, adjoining the other entrance, is the casual ward. As a large area of the ground will be cultivated by the paupers there has been in connection with this section of the work a farm building erected, together with piggeries, stables and other outbuildings. Conduits for carrying the gas and water-pipes and the electric-lighting mains have been placed around all the buildings, and by means of these convenient tunnels any defect below the ground level will be remedied without disturbing the fabric or the floors. In the infirmary pavilions the floors are fireproof, being composed of concrete and steel joists supported on steel girders, and as a further precaution against an outbreak of fire there are, in addition to the usual staircases, means of exit provided by outside emergency staircases of iron in all the

buildings where the inmates will be housed. At present there is one important and necessary element absent from the "new homes." For some time boring operations have been in progress to secure a supply of water, but without success, and it is expected that a connection will have to be made with the Wolverhampton Corporation mains.

PUBLIC CONTRACTS IN CANADA.

AN Act is now in operation in the State of New York, having reference to government and municipal contracts. It has been revised for Canadian use, and was presented to the Government for adoption. The following is the text:—

The people of the Dominion of Canada represented, do enact as follows:—

Section 1.—All specifications or contracts hereafter made or awarded by the Dominion or by any public department or official thereof, for the erection and construction of buildings, shall be understood to embrace stone and masonry work, carpenterwork, painting and decorating work, plumbing, heating, electrical work, structural ironwork and roofing.

Section 2.—The officer, board or commission charged with the duty of drawing specifications and contracts for the erection and construction of buildings for the Dominion, or any political or other subdivision of the Dominion, must draw separate specifications and contracts to cover the separate kinds of work referred to in Section 1 of this Act, and they must be so drawn as to permit of unfettered bidding for and upon the separate branches of work to be performed.

Section 3.—All contracts hereafter made or awarded by the Dominion, or public department or official thereof, for the erection and construction of buildings, are to be awarded separately upon the separate branches of work, as referred to in Section 1 of this Act, to responsible and reliable individuals, firms and corporations engaged in the business of the kind to which the work to be performed belongs.

Section 4.—No bid shall be received or accepted by the Dominion or any public department or official thereof, unless the party making the bid shows by affidavit that he is a citizen of the Dominion of Canada, and as a test of his fitness to properly perform the work bid for, that he has served an apprenticeship of at least three years at the line of work specified in his bid, or that he is a contractor in the particular line, and has had at least five years' practical experience.

Section 5.—If any person, firm or corporation, to whom a contract is hereafter let, granted or awarded by the Dominion or by any public department or official thereof shall, without the previous written consent specified in section 5 of this Act, assign, transfer, sublet or otherwise dispose of the same, or any right, title or interest therein, to any other person, firm or corporation, the Dominion, public department or official thereof, as the case may be, shall be relieved and discharged from any and all liability and obligations growing out of the contract, and to the persons, firm or corporation to whom the contract is so assigned, transferred or sublet, or otherwise disposed of, right, title or interest in the same, and said contractor, assignee, transferee or sub-lessee shall forfeit and lose all moneys theretofore earned under said contract, except so much as may be required to pay his employés, provided that nothing herein contained shall be construed to hinder, prevent or obstruct an assignment by such contractor for the benefit of his creditors made pursuant to the statutes of the Dominion.

Section 6.—All Acts and parts of Acts inconsistent with this Act are hereby repealed.

Section 7.—This Act shall take effect immediately.

AMERICAN TRADE "GRAFTING."

AN article on "Graft in the Labour Unions" appears in the *New York Daily Tribune* of July 25. The writer says: "The building trades of this city have long been in a demoralised condition. It would be by no means an exaggeration to say that the organised labour in general to judge it by the doings of the 'adventurers' and 'grafters' who have found through their control of the masons, carpenters and smiths here a ready instrument for the practice of systematic extortion or blackmail. We may well believe that the situation revealed in the trial of Lawrence Murphy is exceptional. Nevertheless it shows such possibilities of perverting labour organisation into machines for systematic and wholesale blackmailing that it ought to put all honest workmen on their guard. He was charged with embezzling 12,000 dols. of the funds of the Journeymen Stonecutters' Union. His defence is that the money was obtained by extortion; and therefore that he could not be held for embezzling money from those to whom it did not rightly belong. We are not concerned with the moral sufficiency of this defence. If accepted, it merely shows that two sets of thieves have fallen out. The trial, however, a little doubt that the contractors have for a long while

submitting to robbery. Perhaps they are not entitled to sympathy; the man who is so cowardly as to let himself be blackmailed generally deserves it. They are to blame as much as anybody for the expensive troubles in the building trades. Instead of resisting extortion at the first and putting down, they have paid for peace, and each year found the demands made upon them more extravagant. Finally they have lost vast sums of money in a strike which was precipitated when they could get no further in concessions. The accounts given by Mr. Andrew D. Baird of a 10,000 dols. payment to a union when his men joined it, as a penalty for having carried on business before without making them join, could doubtless be paralleled by many other contractors whose own timidity laid them open to extortion. Nevertheless, labour unionists cannot afford to ignore the criminal activities of those whom they put in power. Submitting themselves to the dictation of walking delegates, as they have, they have created an engine apt for extortion. They have made it difficult for the contractor, especially the small contractor with little capital, to resist extortion. He learned from experience that they would generally stand by the walking delegate, no matter how unreasonable his demands. The contractor could not go to the workers and reason with them, and show that the union demands were being made by leaders, not to benefit the employes, but to fill the pockets of their dishonest leaders. They would not believe it. The strike would go on, and the contractor might be ruined. The labour unionists, by blind partisanship and clannishness, have made robbery in their name easy, and if they do not want themselves and their organisations to be utterly discredited they must take a more vigilant attitude toward their leaders, and put a stop to blackmailing in their behalf. Respectable labour unionists must show that they have no sympathy with such methods, and all aid no allied unionists who let themselves be made instruments of extortion.

OILING EXPERIMENTS IN BOMBAY.

At a recent meeting of the Bombay municipality a report was presented by the executive engineer upon the results of oiling the roads of the city with petroleum—an experiment which has been tried in this country but has not fulfilled expectations. The Bombay engineer says:—

"The surface was experimentally treated of a portion of

the Esplanade Road from the National Bank to Messrs. Treacher & Co.'s premises (except the tramway track) with crude petroleum as a means of preventing the dust nuisance caused by the heavy vehicular traffic on that road. The public were at first much prejudiced against the experiment. But as time went on the work was much appreciated. From the time the first dressing was put down until now no complaint as regards dust nuisance has been received except from one of the firms occupying the ground floor of a building abutting on the road, but this was more owing to the dust from the undressed portions on either side of the oiled portion. Three dressings have been given—the first on November 26 last, when about 5½ tons, or 1,298 gallons of the oil, was sprinkled; the second on December 21 last, when about 3½ tons, or 737 gallons, was used; and the third on February 22 last, when 1½ ton, or 413 gallons, was used. It will be seen from this that the quantity of oil was diminished at each subsequent dressing.

"The oil was laid by means of the ordinary watering carts and cans, and then equally spread over the road surface by means of brooms and brushes. On the first application the oil soaked quickly into the road surface, rendering it smooth and firm, but it was slightly slippery where, owing to unevenness of the surface, there was a stagnation of oil in the hollows. It also gave off a strong smell for a day or two in the beginning, but it gradually disappeared. The experiment has so far proved a success. The sprinkling of the oil keeps down the dust, and makes the surface smooth and pleasant to drive on. The questions now to be considered are what effect the monsoon will have on the oiled surface, and what the cost would be compared with that of watering and scavenging. As the dressing has not yet been subjected to the action of the monsoon, I have some hesitation in pronouncing the oiling to be a success, though the chances are likely to be in its favour.

"The cost of the three coatings of oil has been 408 rs., against 179 rs., which would have been the cost if the same area had been watered and scavenged as usual. If the third coating of oil lasts till the setting in of the rains, which I hope it will do, then the excess expenditure incurred by treating the road surface with oil, measuring about 5,800 square yards, would be about 229 rs. over the cost of watering and scavenging. This last sum includes the cost of scraping, sand-stoning and general patching the road surface, and the value of the water at 3 annas per 1,000 gallons; also the cost of repairs to the hydrants, &c.

"It appears to me that the application of oil to the road

surface not only lays down the dust and renders the surface smooth, but prevents the road from being cut up. It cannot be stated at this stage what the saving would be in repairs to the road, but I believe it will not form an insignificant item. Taking everything into consideration, I am of opinion that after the ensuing monsoon is over the whole of the road extending from the Apollo Bunder to the Municipal Offices should be treated with oil."

THE PROPOSED AUSTRALIAN CAPITAL.

A CORRESPONDENT of the *Standard* supplies the following description of Tumut:—The town is a picturesque little "one-horse" place. It lies spread over a hillside, its long main street falling along the slope from the "bush"-covered hill-top to the winding river below. The majority of the houses are one-storeyed weather-board cottages, with narrow verandahs along their street frontage. The better-class buildings are of brick, of the ordinary bungalow type, with deep verandahs on every side. Only in the central part of the town do we find two-storeyed houses; the banks, four in number, the hotels, ten in all, and the stores are the only buildings that soar higher than the ordinary single-storey level.

The Post Office and the School of Arts are the centres of civic life. They are, as is usual in colonial towns, the most important buildings. The Post Office is the general rendezvous at that movable feast, the arrival of the mail coach. Then only can the thrill of being in touch with outer things be experienced by the citizens. As the four-horse coach approaches the Post Office, with a mighty cracking of whip by the coach-driver, the whole town is diverted from the contemplation of local concerns to the affairs of the great world. In the evening the School of Arts becomes the centre of interest. The reading-room and the public library are there. Meetings are held within it and lectures are delivered beneath its roof. Not far off the favourite hotel bars are handy for the thirsty man, and the term includes a very large number of the population on this heated continent. In nothing more than his adherence to the type of hotel familiar to him in the old country does John Bull show his conservatism, for in this huge continent, with a climate ideally fitted for the outdoor café, there is scarcely a single example of the continental open-air resort. The closed-in, cramped-up bar, whose atmo-

sphere alone should produce faintness, flourishes as if Australia were in the frigid zone. In the town are two large schools, the standing of an English higher-grade school, and the control of the Minister of Public Instruction, the only convent school. The four churches—Presbyterian, English, Roman Catholic and Wesleyan—occupy the four points of a compass at the extremities of a cross. The colonist is an ardent church-builder, but he is not always so enthusiastic a church-goer.

Such is the quiet and secluded spot in which the Federal authorities propose to raise a new city, to accommodate the machinery of central government in Australia. If it is chosen from the grosser interests of mere commerce being the ideal, Tumut is the ideal, and in its excellent climatic conditions a legislator will be provided with the best atmosphere for stimulating mental activity, and at the same time insuring a healthy mind in a healthy body. The isolation is, of course, irremovable. A short line of some twenty miles—a distance now served by coach—would connect the town with Gungahlin, the nearest railway terminus. The latter town is not on the main railroad from Sydney to Melbourne, but is the terminus of a branch, thirty miles in length, that joins the main line at Cootamundra. From the latter junction the Federal legislature can go north-west to Queensland, or south to Victoria and to South Australia. West Australia, still unconnected by rail, and the island State of Tasmania, are out of touch with the main arteries of railroad communication.

It is curious to note how this little, unknown town has won a commanding position with regard to the four great capitals of the East. It is equidistant from Sydney, Melbourne, and from Adelaide and Brisbane, which are, however, about 400 miles further off than the two first mentioned. Then, situated as it is on a tributary of the one great Australian artery—the Murray river—Tumut, as it were, overlooks the highest spot the whole Murray basin, a district which comprises much more than half the area of the continent. The Site Commissioners have to be congratulated on the result of their labours, for their task of decision must have been difficult. Bathurst and Bombala, Eden and Armidale, and the other rivals, have probably much more political influence without the natural advantages that Tumut so undoubtedly possesses. The recommendation of Tumut is therefore creditable in that it steers clear of the baser motives which are not always wanting from the actions of even the most interested of political parties.

ARMOURED FIRE DOORS

Telephone,
No. 143 Westminster.

Telegrams,
"Sprinkler, London."

Officially Endorsed by the
Fire Offices Committee.

Lighter and Cheaper than
Iron Doors.

Can be made to Close
Automatically in Case
of Fire.

Will NOT Buckle or Twist
out of Shape.

ALSO MAKERS OF THE ARMOURED
URALITE DOORS.

And at Glasgow, Leeds, Birmingham, &c.

The Architect.

THE WEEK.

THE late RICHARD M. UPJOHN, who died in March, was for so long a time prominent among American architects, it was generally believed he was a native of the States. But according to the *Quarterly Bulletin* of the American Institute Mr. UPJOHN was born in Shaftesbury, Dorsetshire, in 1828, and was taken to America when he was 20 years old. When he was eighteen years old he entered the office of his father, who was one of the charter members of the Institute, and began to study architecture. He afterwards became his father's partner, and finally succeeded him. He was a Fellow of the American Institute of Architects from its foundation in 1857 to the time of his death, and was President of the New York Chapter for two years. He was also a member of the Metropolitan Museum of Art. His office was the schoolroom from which many architects graduated into a professional life to which they gave, in several cases, given more than usual evidence of their early training in securing, through their works, exceptional honour; among these being Mr. CLINTON, of CLINTON & RUSSELL, Mr. CYRUS L. W. EIDLITZ, of New York, and Mr. SOLON S. BEMAN, of Chicago.

WHEN OCTAVIUS accepted the title of Imperator from the Roman Senate, which was soon followed by that of Augustus, he was able to persuade the Romans of the restoration of peace which was supposed to be universal. The Temple of Janus was closed, and according to custom, an altar was erected. The Ara Pacis Augustæ was, like other memorials, believed to have been demolished, and its site was disputed. About twenty-five years ago some marble blocks with figures and ornaments were assumed by German archaeologists to have been part of the altar. A volume on the discovery was published in Vienna. After times remains in a similar style were found, and were thought to belong to it. They were traced to the grounds of the Palazzo Fiano, adjoining the Corso. That building now belongs to Signor ALMAGIA, an engineer and contractor. He has given permission for explorations in the court and grounds, as well as in the cellars of the building. One of the first objects discovered was a fragment of a frieze which corresponds with the parts above mentioned. It could be well if the work could be continued in the neighbouring streets, but the authorities will not allow them to be opened. The operations in the lower part of the Palazzo were carried out with great difficulty, for water has entered, and is only by unceasing pumping the place is kept from inundation. It is now believed that the history of the house of CÆSAR was represented and shown to be identical with that of Rome.

THE Place Malesherbes, near the Parc Monceau, in the north-west of Paris, is adorned by a memorial of ALEXANDRE DUMAS, which is the work of GUSTAVE DORÉ; it is suggestive of the great creator of romances, for on one side of the pedestal we see the figure of D'ARTAGNAN, and on the other a workman reading one of the marvellous books to a young woman. Everybody was satisfied to have a public recognition of a writer who afforded immense enjoyment not only to Frenchmen, but to readers in all countries, yet is never able to attain admission into the Academy. One of the proofs of the gratification of Parisians was given in the proposal that memorials should also be erected in the Place to General DUMAS, who was one of the revolutionary warriors, and of ALEXANDRE DUMAS fils, who was also a writer and the foremost dramatist of his time. The latter work of M. SAINT MARCEAUX, and may now be said to be completed. The idea inspiring the work has given hope for an admirable combination of figure sculpture, around the pedestal will be represented the principal figures created by the author, from "Margaret Gauthier," a "Dame aux Camélias," the first of the creations, to "Denise," who may be considered the last. General DUMAS is shown as he appeared in his attack on the bridge of Arcole. The name of the Place will no doubt be soon changed, for it is popularly known as La Place des Trois mas.

THERE is one peculiarity of the English language which makes it suitable for universal application, especially for inscriptions—that is, the absence of accents. An inscription in English capitals consists of two parallel lines which are unbroken, and range with the architectural lines. One in French has the upper line disturbed by accents, and sometimes the lower one by the cedilla. The Germans are not partial to accents, but the diæresis is no less disturbing of continuity. One notable case which has been made the subject of much comment is the inscription on the façade of the Grand Palais in Paris. If set up in type it would be as follows:—"Ce monument a été consacré par la République à la gloire de l'art français." But the stonemason, who no doubt recognised the importance of the lapidary style, was indifferent to the "accents aigus" or the "cedilla." The appearance of the line of letters, in a decorative sense, is improved, but teachers of grammar, writers, and above all M. SARDOU, the dramatist, who was consulted by the architect, are horrified. Accents no doubt help in phonography, but who would care to have a page of English set up in the manner of a pronouncing dictionary? An inscription on a building should be considered as sculpture and allowed some of the privileges of that art.

WE have lately referred to the manner of instruction in the Technical High School of Berlin. There is also an Agricultural High School, of which one section, that of geodetics, may have interest for our readers. The course in geodetics lasts from four to five terms (two to two and a half years) and commences after Easter; students of this latter course must produce leaving certificates of a nine-class higher preparatory school (classical or "real" gymnasium, upper "real" school) and proof of at least one year's practical work. The number and nature of subjects considered necessary seem somewhat extensive for land surveyors, and beyond their usual sphere, but at present in Germany most students of geodetics devote themselves in the course of their further studies to the agricultural engineering branch of their profession. This is probably the result of the fact that most land surveying operations are now undertaken with a view to drainage and irrigation work later. The subjects comprise mathematics and physics, tracing of roads, drawing, practical surveying work, agricultural civil engineering, designing of drainage and irrigation works, agricultural civil engineering, earthworks, building materials and building construction, road and bridge building, hydraulic engineering, projecting of roadways, bridges and hydraulic works. There are also classes for land and moor reclamation, national economy, law, &c. The instruction given in the lectures is supplemented and assisted by practical work and scientific research work in the laboratories, collections and various institutes, and by demonstrations and excursions. The professorial staff of the Agricultural High School consists of no less than sixty-five members, including qualified professors, lecturers and assistants. Similar schools have been set up in other parts of Germany.

FEW of those who can only make a short visit to Paris are acquainted with the river known as the Bièvre. Its course is not always marked on a map of Paris, but one prominent point where it is seen is near the Gobelins Factory, and it enters the Seine near the Pont d'Austerlitz. It has its rise not far from Versailles. It is as dirty as any river in an English manufacturing town. It does a great deal of work, and in return is fouled. But here and there along its sides many tumble-down houses are visible, which are rather picturesque, especially in contrast with the regular architecture of the streets. The law of change weighs heavily in Paris, and the river Bièvre will soon be covered over, for it is doomed to conversion into a sewer, a purpose which it serves already to a great extent. On that account it was condemned, for it is as unpleasant to the sense of smell as to the sight. It had some fascination for one class of residents. It ran through a district which even the Quartier Latin disowned, but in which some of the poorest students were compelled to live. That it should retain motion in spite of all its burdens suggested to many unfortunates that life could be sustained amidst miseries. It will now have to do its work in secret.

GREEK ELASTICITY.

GREEK architecture is so prized in modern times, we find a difficulty in understanding the seeming indifference of ancient writers towards it. Modern buildings, especially in this country, are, it is true, rarely noticed in books, and we explain the neglect by supposing that authors do not possess the knowledge which is requisite to express praise or blame. It is not to be imagined that the men who are to us as classics were handicapped by ignorance, and their general silence is therefore inexplicable. When any allusion to building is made by one of them, it becomes a gem which merits preservation. The simple remark by ARISTOTLE, when in his "Ethics" he was endeavouring to explain the difference between law and equity, thus acquires an importance which would have amazed the philosopher and his disciples. In Lesbos he said the rule employed in measuring buildings was not made of wood or iron, as in other places; there it was formed of lead, in order that it might more easily be adjusted to the variations of surface of the stones. The words were characteristic, for they suggested the philosopher's desire to make truths visible, as it were, to the sight, while his master believed there was more affinity in the human mind towards abstractions. Probably the Lesbian surveyors had not sufficiently classified moulded or curved work to be capable of calculating the cost of extra labour by the foot run or to make an average allowance for each manner of dressing stone. But the words are a revelation of practice, which is the more interesting from the general absence of descriptions of the processes employed by the Greeks in construction. BLACKSTONE, it may be mentioned, demonstrated the dissimilarity in another way. Courts of equity, according to him, were established because the law from its universality was sometimes unable to deal with particular instances. The Greek and the Englishman alike considered that rhadamanthine inflexibility was ill-adapted for a country where freedom prevailed, and where compromise was a necessity.

We have no intention of discussing either Greek law or Greek surveying. Both were based on theories which were held to be unalterable. Measurement was governed by geometry, which is the least elastic of all forms of truth or science. But in Lesbos it had to succumb to common sense. The geometers could have calculated the relations between convex or concave surfaces and planes, but was the result worth the trouble? The lead rule was simpler.

May we not therefore suppose that those who listened to the Peripatetician or who studied his scrolls were in a condition to realise that, as in geometry, it was sometimes necessary to admit that a line had breadth as well as length, so in a great many other affairs there was no avoiding a compromise with primal or theoretical truth? It was, however, very difficult at one time to appreciate that fact. In England, and within the last century, for instance, it was a conviction that there was a series of dimensions which expressed perfect Greek architecture, and to depart from them was to be guilty of the greatest of crimes against antiquity, good taste and beauty. Men went on year after year building chapels and cottages and public buildings in which the parts were so rigidly consistent to rule they might have been worked out by a mechanical designer, and they took pride in themselves because they were assured they were following the Greek principle.

If the truth were known it would be found that the Greeks were about the last people on the earth's surface who could sustain monotony in any shape or form. The honest citizen who voted for the banishment or death of ARISTIDES because he was wearied of hearing him called "the Just," was a representative man of Athens. We have still higher authority for their preference for novelties in the revered words:—"For all the Athenians and strangers which were there [*i.e.* in Athens] spent their time in nothing else but either to tell or to hear some new thing." Can we suppose that a people with an instinctive love of what was strange could approve of an environment which was without variation? Much as they esteemed Doric temples it could not be said there was evolved a normal settled proportion for one of the columns. Every designer, we imagine, was permitted to introduce variations which pleased him so long as the recognised character of the

style was perceptible. As we now see the ruins there is some warrant for the supposition that when you have seen one Greek temple you have seen all Greek temples. But we possess little more than the skeletons of the buildings. Days when they were in use there were likely to be variations in colour, ornaments, drapery by which no two were considered as identical. There may have been also changes in decorative elements such as drapery or garlands from time to time, and there was no need to test the strength of a Greek's aversion to monotony. Among the survivors remains there is enough evidence to prove that within the limits which were inseparable from the nature of the temple there existed a remarkable variety of detail.

As exceedingly few references to architecture are to be met with, it is necessary to seek in some other art for testimonies indicating the Greek spirit. Let us take sculpture. We possess, unfortunately, no treatise by a Greek on that art. If we were obliged to draw our inferences from the examples which have come down to us, it would be concluded that there were almost as many ideals as artists. But the allusions to statues by Greek writers and the traditions which PLINY recorded must be taken into account. The statement, for instance, that POLYCLETUS produced the *Doryphorus*, or Lance-bearer, which was known as the Canon, has helped to create the belief that in sculpture, as in architecture, there was an established set of proportions to which artists were pressed to conform. However, no other statue confirms that theory. A few figures are found which may be more or less accurate copies or adaptations of the work of POLYCLETUS, and they are expressive of a figure that was well suited to throwing a lance from a fixed position. But figures of other different and more agile kind were adopted for other varieties of warriors as well as for athletes. What is true in that case is true in others. There is no slavish copying of examples. Another case may be mentioned. In FLAXMAN'S day the *Apollo Belvedere* was considered to be adapted for a standard. But FLAXMAN believed it was not likely to be as much appreciated by the ancients as it was by the moderns, because there was a very similar statue, but more in motion, by PHIDIAS, and the stronger expression of the latter, of which only a few traces exist, was sure to prevail. There is no doubt that limitations were accepted by Greek sculptors. Realising that marble and bronze were yielding materials, they never went so far as CANON, and some modern French sculptors in suggesting the softness and pulpiness of flesh. The influence of material is always to be recognised in Greek work. It is only necessary to examine the head of SELENÉ'S horse from the Parthenon, which is now in the British Museum, in order to perceive the effect that was exercised on the artist by the marble. The sculptors were also restricted by tradition. The invention which is allowed to a modern sculptor was not exercised by them, probably because it would not be approved by judges. In days before evolution became a system it was manifested in the sculpture of the Greeks. Although the ancient figures were considered to be rude and uncomely, yet as they were believed to be divinely inspired they were treated with as much reverence as if they expressed sublime ideas in the language of childhood. While the sculptor admitted indebtedness to antiquity he was able to demonstrate that he could not easily although encumbered with fetters. As long as it was required to manifest respect for tradition it was hardly possible for any later sculptor to allow his works to be displayed as paragons of perfection. Like the athletes, particular sculptors may have had their special admirers, but there was too much independence to admit that any one had attained the *beau idéal* which could never be surpassed.

The most striking proof of indifference to any canon is a table with the measurements of the details of Greek statues. The task has been accomplished by several French savants. The measurements prove that the proportions were most variable. It does not matter whether the head or the foot is taken as a unit, there is no uniformity. That fact was plain to every eye accustomed to observe the niceties of form; but for sceptical people feet and inches alone are convincing. WINCKELMANN, at one time supposed a canon of proportion was accepted, but at last realised how insecure was the evidence on which

rested. He found that what VITRUVIUS said about the correspondence between Doric columns and the human form was absurd, and could only have been derived from some peculiar example which may have existed in his neighbourhood. WINCKELMANN was also of opinion that the observance of a canon was of no great importance. He found that some artists were skilled in proportion, but were incompetent to produce beauty, and he concluded that the ancient artists subordinated proportion to beauty in a degree which was justifiable.

But, in spite of all that has been written and the results of most accurate measurements, it cannot be said that the conviction about the existence of sets of rules among the Greeks has been overcome. The scientific mind believes that when perfection is attained the elements constituting it can be analysed and established for adoption in other cases. The most beautiful building and the finest statue are thought to be alike capable of enclosure within certain triangles or parts of circles, and the mathematician consequently can become a law-giver to the artist. According to one authority, the human countenance itself is made up of "arched or curved brows, circular and globular eyes, angular and pyramidal nose, and linear mouth;" while another investigator says the head and countenance consist of seven angles. It is not realised that a line which to a geometrician may appear as a single curve is made up of several, and of so little importance are right lines, although they may enclose angles, in producing beauty, the Greeks often substituted curved lines, which were long described as being rigid right lines. In other words, the flexible leaden ruler seems to have been utilised in many other ways besides measuring stonework.

THE CANAL PROBLEM.

IN the second half of the eighteenth century it appeared as if a great part of England was to be intersected by canals. The saying attributed to BRINDLEY, that rivers were created to feed navigable canals, was expressive of a general belief. Owing to the success of the Duke of BRIDGEWATER'S undertaking, no less than 165 Acts authorising the execution of similar works were applied for in Parliament. A financial crisis, partly caused by fear of a war with France, checked the advance of canals. The introduction of railways superseded conveyance by means of water, but before STEPHENSON'S revolution the cutting of canals was not considered to be a profitable speculation. They were unable to compete with railways in expedition, and the directors of the new iron roads took care to keep canals in a backward condition by purchasing them wherever possible, or in other ways preventing improvements. There are, it is reckoned, nearly 4,000 miles of canals and canalised rivers in this country, and it has been found that railway companies own more than 1,100 miles of them, and can exert influence over at least an equal length.

When it was found that foreign countries were constructing canals of a kind which were unknown to BRINDLEY, it began to be realised that those means of communication were not entirely obsolete. ROBERT STEPHENSON, as became the leading representative of railway construction, was an opponent of DE LESSEPS'S scheme for the making of the Suez Canal. Elsewhere its advantages were recognised. The work was carried out without the aid of English capital, and was so successful, in a few years it became necessary to widen and deepen the course. In Greece, Russia, Germany, Belgium, America, important works were undertaken, and each of them was a commentary on the wasteful policy which was allowed to be followed in England by the railway companies without any interference on the part of the Government. The construction of the Manchester Ship Canal was evidence of reconversion to a belief in old-fashioned ideas.

Prejudice in England takes a long time to be dispelled. great many people are not convinced that water traffic is adapted to modern needs, and in consequence numerous canals are neglected or are worked under conditions which are of little advantage either to the owners or to the commerce and manufactures of the country. It must be

admitted that the problem of canal utilisation is not easily solved. When most of the waterways were commenced the only means of traction was the canal barge drawn by horses. It was therefore unnecessary, as there would be no disturbance of the water, to make any more provision for the security of the bottom and sides than would be needed in a river with a gentle current. Many canals were ill-adapted for boats propelled by steam. In parts where the sides were lined with stone pitching or concrete there was of course no difficulty. Horse haulage is inadequate if expedition is sought, and on many canals it would be required to expend money liberally if steam or electric barges were introduced.

We have of late years taken foreign practice as a guide, and an application was recently made to the Government on behalf of various Chambers of Commerce in order to obtain reports from France, Holland, Belgium, Germany and Austria about the navigable waterways of those countries. The information sought related principally to the character and cost of improvements, tolls, and the results as regards railways, seaports, and the trade and commerce of each country. The reports having been received have been printed, and are certainly remarkable, especially if we consider what would be the character of similar statements by foreigners on the waterways of Great Britain.

In Austria-Hungary, as with us, river traffic lost the importance it once possessed, and in some rivers there was a complete standstill. Although the Government exercised control over railways, it was found impracticable to convey bulky merchandise of low value at cheap rates. In order to supplement the railways, in 1901 the large sum of 10,000,000/ sterling was voted for waterways. Three millions were assigned for river regulation and seven millions towards the construction of a network of navigable canals. Considering the financial state of the country that is a heavy outlay. It is not possible to measure the results at present. The traffic seems to respond to the efforts made by the State. Of the 3,000 miles of waterway about 1,200 are adapted only for rafts. Most of the river traffic finds its way to the Danube, which owing to recent improvements is open throughout to steamships. Some of the tributaries also can be used by large vessels. In Hungary there has been an increase of nearly 50 per cent. in river traffic. But as cheap rates are charged on the railways much of the traffic which would be expected to go by water is now carried on land. The Danube is free, but to defray the cost of the conservancy works at the Iron Gates a toll has to be levied. It should be mentioned that an exceptional reduction is made in favour of quarried stone, gravel, cement, lime, bricks and wood.

In a quarter of a century between 1875 and 1900 the Belgian Government have expended 16,000,000/ sterling on the improvement and upkeep of navigable waterways, harbours and coasts. There are 1,372 miles of internal waterways in the country, and the State administers the greater part, or about 1,118 miles of them. Tidal rivers are generally exempt from tolls. The State does not derive any interest from the capital expended on the improvement of the waterways, inasmuch as the working and use of this means of transport are left to private initiative. At the most the tolls levied on navigation may be said only partly to reimburse the State for the expenses incurred in keeping the system of navigable waterways in working order. In the course of the twenty years between 1880 and 1900 the extension of Belgian trade has been enormous. The traffic on the navigable waterways has grown from 225,000,000 tons per mile in 1880 to 560,000,000 tons per mile in 1900, being an increase of 150 per cent. Over the State railways, the tonnage of freight transported has increased from 14,000,000 to 40,000,000 tons, *i.e.* has almost trebled. Between 1875 and 1900 the general commerce of the country has grown from 180,000,000/ to 280,000,000/. How much of the increase is to be attributed to the water traffic cannot be determined, but it is claimed that in providing the country with a system of navigable waterways and cheap transport, in multiplying the points of contact between road, rail and water transport, and thus facilitating transshipments, in rendering the seaports easier of access and in stimulating the erection of numerous commercial

and manufacturing establishments, this work of improvement has been one of the principal factors of the commercial prosperity of the country.

There is less certainty in the case of France. During the seven years following the Franco-German war the country expended 9,640,000*l.* on the improvement of waterways and ports. The amount shows the importance attached by statesmen to the works as means to enable France to recover prosperity. Then between 1879 and 1900 the large sum of 18,000,000*l.* was laid out. In consequence, the length of first-class waterways was increased from 906 miles to 2,930 miles, including 401 miles of newly-constructed canals. The Rhône, Saône, Marne and Seine were radically transformed. At the present time the total length of French waterways classed as navigable extends to 7,330 miles of river and 3,045 miles of canal. Other extensions are now in progress. The money was found almost wholly by the State, but in some cases local bodies contributed. One result of the improvements is a reduction of from 20 to 25 per cent. in the cost of transport. There has been an increase in water traffic from 20,000,000 tons in 1878 to 32,000,000 tons in 1898, the river Seine especially having gained.

This would appear satisfactory to all. But M. COLSON, who was formerly a director of the railway department of the French Ministry of Public Works, looks on so much success as illusory. In the first place, he says the net cost of transport is higher by water than by rail. Thus if carrying a ton for a kilometre, or 1,094 English yards, on a waterway costs 1 centime, on a railway it would be six-tenths to eight-tenths of a centime. A railway company could therefore reduce its charges so low as to ruin a waterway. That occurred in the course of the contest between the Midi Railway Company and the Canal du Midi. The latter had to succumb and was leased to its rival. Where the canals are owned by the State the railway is at a disadvantage in the competition. Not only is the canal upheld in spite of its losses, but the railway rates being controlled by Government they cannot be brought below a certain amount. The conclusion drawn by the English official, Mr. O'BEIRNE, is that "on the whole the returns seem to show that the competition of the canals has been injurious to the French railways most affected by it. But it must be borne in mind that this is the result, not of free competition between the two routes, but of Government control exercised in favour of the waterways."

That statement is sure to be taken by the supporters of the railway system as conclusive. But statistics we know are pliable, if not vacillating, and the opposition between the authorities of canals and railways is more intense in France than in England. If there was co-operation between the two, probably there would be less waste on both sides. According to Mr. O'BEIRNE, if the money expended by the Government on the improvement of canals and other waterways had been expended on the enlargement of railways, there would be much saving of public money. The French trader, however, gains, for his merchandise is carried more cheaply than formerly, but whether other people have to suffer by paying increased imposts is a question which is not to be answered by a brief report. The British consuls at seaports are in favour of the canals, although they point out the waste of money and the delay which arise from the general absence of direct communication between the railways and docks.

It is difficult to believe that the efforts which are made in Germany are solely inspired by a desire for the improvement of trade. But there is no doubt commerce and industry are gainers by the attention to canalisation. In the year 1900 there were 8,798 miles of waterways, including rivers, canalised rivers and canals, within the German Empire. The statistics also show there has been a vast increase in the number of steamers and other vessels and a proportionate increase of tonnage. Prussia gives the example of raising and expending money liberally for the improvements. We are told that the Prussian Government have always been of the opinion that an extensive and growing canal system is not opposed to the interests of the State railway system, but that, on the contrary, the two complete one another and should work well together in the interests of the public. The Prussian Minister of Public Works has publicly declared that the assistance of the

waterways was necessary to the railways, in order to be able to deal with the rapidly increasing traffic. That seems to express the common-sense view of the matter. Where there is divided authority, as in France, the endeavour for one system to overcome the other. The competition between French railways and canals resembles that between the railway companies in Ireland, where the interests of passengers and of traders are sacrificed to the enmity between boards of directors. In Prussia it is not possible for public interests to suffer for the satisfaction of individuals. Railways and canals must work together to attain a common end, and that is all that can be desired in England.

Waterways are no modern invention for the Dutch. At the present day it is considered preferable by passengers to use them, like their forefathers, for travelling whenever time admits. For many years there existed a prejudice against the railway throughout Holland. But even the time is sometimes money, and, in spite of opposition, the Government were at last compelled to construct a system of railways. As they were not intended to bring in a large revenue—for the State is satisfied with 1 per cent. on the original outlay—the charges on the lines for the conveyance of goods are lower than would be possible if the proper belonged to ordinary shareholders. It was not until 1878-79 that attention was given to goods traffic on railways. Most of the transport still continues to be borne on the waterways, and it is expected that with the introduction of small and cheap petroleum motors the railways must further suffer. At present a ton of goods can be carried 156 miles on some waterways for 1*s.* 3*d.*, whilst the railway freight for 126 miles is from 4*s.* 7*d.* to 5*s.* per ton. Waterways in Holland must therefore be considered as being worked under conditions which can never prevail in England. In London the railway companies constantly complain of the unfair opposition of the omnibus companies, who can make use of roads which they did not construct. The canals in Holland are like London streets, and it is impossible to invent any ways which can compete with them.

The reports on the whole are unquestionably in favour of giving increased attention to English canals. Something has been done already. The success of the Aire and Calder Navigation, the River Weaver Navigation and the Severn Navigation are sufficient to demonstrate how much benefit can arise at a comparatively small cost. But to insure success by making canals more serviceable than the railways it will be necessary to have some abatement of the jealousy which railway companies display towards the other means of communication. The improvements in hydraulic machinery can remove some of the difficulties which attended the use of locks, and less time will be lost than formerly. In expedition railways are likely to be the more advantageous, although complaints are constantly being suggested that many companies occasionally fail to realise the importance of time. Motor traffic on public roads might be assumed to be a cheap substitute for canals, but the conditions under which the traffic would have to be conducted impose such limitations as to make the advantages of such a system doubtful. Whether the Chamber of Commerce are likely to be of any use in promoting the utility of canals remains to be seen. They have not done much for railways, and their views in general are extremely limited. It would be far more desirable if the railway companies who own canals would imitate the practice of the German Government and employ both classes of property for the benefit of the public, which would eventually result to the profit of the shareholders.

Mr. James White, of Sydney, whose designs for the Queen Victoria Memorial statue to be erected in Melbourne gained the first place in the recent competition, has been commissioned to execute the work, and a premium of 50*l.* has been awarded to Mr. C. W. Jewett, of Brecknock studios, London, N.W.

The Lectures of the Sanitary Institute will commence September 14. In October three lectures will be delivered by Professor Elsey Smith on "Building Materials," "Sanitary Building Construction and Planning; Soil and Local Physical Conditions," "Ventilation, Warming and Lighting."

THOMAS BEWICK.

IN 1753 Thomas Bewick, to whom is owing the revival of wood-engraving in England, was born at Cherryburn, near Newcastle-on-Tyne. His centenary should have been celebrated in 1853, but at that time such commemorations were only admitted for a few men. The Pen and Palette Club of Newcastle-on-Tyne resolved to recognise the 150th anniversary of Bewick's birth by a pilgrimage to Ovingham, where he was buried, and to Cherryburn. Bewick was apprenticed in 1767 to Ralph Beilby, of Newcastle, a general engraver, who undertook anything, from book-plates to clock faces. Bewick's first efforts in wood were diagrams for Hutton's "Treatise on Mensuration;" but though it is known that he endeavoured to improve himself in this line it was in private, for his master had little or no employment of the kind for him. After his apprenticeship he devoted himself however to the art, and in 1775 he received a premium from the Society of Arts for the cut of the "Huntsman and the Old Hound," which appeared subsequently in an edition of Gay's "Fables" published in 1779. After a short visit to London, he entered into partnership with his old master in 1777, his brother John becoming their apprentice. He continued the practice of his art, furnishing the cuts to the edition of Gay's "Fables" and to an edition of "Select Fables" in 1784. In 1785 he commenced the cuts for his "General History of Quadrupeds," for which the descriptions were written by Beilby, and which was published in 1790. The excellence of the work insured its success, and editions rapidly succeeded each other. The merit of the work, however, did not consist merely in the execution of the cuts. Bewick drew all the designs himself; the drawing was in general remarkably correct, and the backgrounds and little vignettes full of the most natural expression, simplicity, feeling and beauty. The success of the "History of Quadrupeds" led immediately to the commencement of a "History of British Birds," of which the first volume appeared in 1797 and the second in 1804. Bewick had now taken pupils, and in this work was materially assisted by them.

At Bewick's grave an address was delivered by Mr. D. Proal Thomson. In the course of it he said that the celebration of the anniversary of either the birth or the death of the notables of a locality was less usual amongst the British people than amongst other nationalities. When the youth of to-day, who had wit enough to appreciate the advantages of living at the beginning of the twentieth century, realised clearly the probable success which followed perseverance in pursuit of an object, and acquired patience in waiting for the always apparently delayed result, and combined with this an ability to profit by the experience of those who had gone before, he was also justified in feeling fairly certain of ultimate success, and that he too would reap a rich reward as a result of his industrious labour. For this reason he had welcomed the opportunity given by that meeting to draw the attention of the youth of Bewick's neighbourhood to the position reached by his most famous of local artists; one who, beginning from the smallest things, nourished and cultivated the gift God had bestowed upon him, and spared no pains until he accomplished his end, with the result that his name was now honoured all over the world. Thomas Bewick was the restorer of wood-engraving to a place in the arts—the artist who was imbued by nature with the power to give artistic expression in works of art, small in size, but perfect in quality; the artist whose knowledge of the beauty of British birds had never been surpassed, and the moralist whose designs drove home a pictorial satire in the only way acceptable at the time. Thomas Bewick was, in fact, one of the premier heralds of the romantic movement which in painting reached its apogee at the close of the eighteenth century. He was one of the first to sound precisely the depths of nature in certain aspects, to reveal the glowing warmth of summer and the bitter cold of winter as shown in his famous tail-pieces, the feathery downiness of a bird's breast, the lithesome beauty of a ferocious animal. Thomas Bewick was a man, above all things, continually searching for and frequently finding the extreme beauty and everlasting charm of nature in a method no one previously had been led to pursue. His artistic achievements, if simple, were the direct results of nature's teaching, and this, with the vital spark of genius he had, had rendered him a personality whose distinction was as great now as it was a hundred years ago. How many men, who are now called Thomas Bewick was when young, had remained in the country where people seemed naturally gifted there were probably many; but none the less did it become them to seek the man who recognised his own talent, and who had cultivated his own corner of the artistic garden in such a way as to reach a perfection not yet surpassed. When Thomas Bewick was born, 150 years ago, and even for 50 years later, the art of nature, as we understand it, scarcely existed. Landscape painting, the last of the varieties of artistic expression that we understood and really admired for its own sake, was known only to the English through Ruysdael and Hobbema, for Claude of Lorraine did not so much paint Nature as he saw her, but rather founded

certain conventionalities—admirable, but still conventional—on his observations. English art knew nothing of transcripts from nature except in Richard Wilson, and Gainsborough painting his glorious landscapes a little later was content to let them be hidden and neglected while his portraits rivalled Sir Joshua Reynolds's, who only once or twice painted a landscape except as a background. The Norwich artists also were just beginning to think about the possibilities of their richly coloured country. Nevertheless, the love of nature was soon to become the most remarkable artistic development of the times; but up to 1785, when Thomas Bewick began to engrave the first block of the "Quadrupeds," there was little movement towards natural expression. Turner was only ten years old, Sir Walter Scott fourteen, and Constable was only nine, and these were to be the most famous exponents of the love of nature in the early part of the approaching nineteenth century. A dozen years after beginning the "Quadrupeds," that was in 1797, when Bewick published the first volume of the "British Birds" (the land birds), some progress had been made, and in 1805, when the second volume (the water birds) was issued, there was a general activity in the appreciation of nature; but a comparison of the history of the time showed that Thomas Bewick's most famous work was already accomplished, when others were only at the beginning of things. Bewick's birds showed a love of natural beauty absolutely unique at the time, and for this reason in itself he was worthy of all honour. He gave the world an epitome of winter in his tail-piece of the snow-clad cottage in the first volume of "British Birds" a dozen years before Turner painted his "Frosty Morning," and fifty years before Theodore Rousseau carried out "Le Givre," both of which were the finest pictorial expositions of cold that had been created. Bewick was drawing and engraving pictures of the banks of the Tyne long before Constable devoted himself to Willie Lot's mill and the locks on the Stowe. And the most beautiful tail-piece of the "Angler" (in the second volume of the birds) was published in the same year as Scott's "Lay of the Last Minstrel," and before his "Lady of the Lake," which has never ceased to make his readers realise the charms of the Trossachs. It would be perhaps too far-fetched to say he anticipated Mr. Whistler in his lithograph of the "Cadger's Trot," drawn in 1823. Yet there was a movement in the horse and a general suggestiveness in the rapidly executed sketch that would have pleased the later-day master who made so magical a lithograph in "The Babies of the Luxembourg." But that Bewick was a competent forerunner of the English pre-Raphaelites, no one with any knowledge of the Tyne-side studies from nature in its minutest parts would dare gainsay. Enough, however, had been said to make good the claim of Thomas Bewick to have been an originator in the first degree. His works were limited, as all beginnings must be, yet it remained true that he was the first to lead artists to nature, and, like the source of a mighty river, to give the premier contribution to what has since attained so large dimensions. "Bewick's Birds" and "Bewick's Quadrupeds" were the three volumes on which the artist's fame most firmly depended. Every Bewick admirer understood and appreciated the merits of these books, as well as of the many other Bewick engravings to be found in various publications, and much time had been spent in cataloguing and describing them. The birds and quadrupeds, what sweet memories they called forth. The cock titmouse perched on the branch, the willow wren about to fly from its luxuriant bank, the tame duck in feathery tones and half-tones, and stately turkey cock, which seemed to move as one looked at it. Then the partridge, the snipe, the geese, the swans, the sandpipers, and, perhaps, most beautiful of all, so at least was the artist's own opinion, the yellow bunting. The quadrupeds were naturally more prosaic in form as well as in realisation—the splendid series of foxes, the dogs, especially the Spanish pointer, the white rabbit, and of the wild animals, the tiger, were the best; and many renewed delights could be found and experienced in looking them over. Yet all these paled in actual interest before the wonderful series of tail-pieces (first begun in the 1784 "Fables"), successfully continued in the "Quadrupeds" of 1790, and culminating in the two volumes of birds of the succeeding years. It was certainly the tail-pieces which most readily appealed to Bewick's admirers. Their quality of humour was more easily understood than the artistic expression of tone in the birds and animals. Their stories were clear to the bucolic intellect, and while most of them had points no ordinary peasant would readily grasp, yet the tail-pieces were undoubtedly less subtle than the other illustrations. Each Bewick admirer present had, doubtless, his own favourites, and no one would grudge any single design a word of commendation. His own favourites were the snow pieces, the little cottage in winter, with the barn and the lean-to shed, the tall tree with the nearly exhausted hayrick beyond, from the birds; the supremely hungry ewe lamb, the starving mother nibbling at an old garden broom, while her little one vainly sought its natural nourishment, from the quadrupeds; and the poachers, also from the birds, following the easily

visible footprints in the snow-clad landscape. Much had been written on these marvellous little pictures, and yet one could come to them with new interest every time they were examined. Their humour might first attract, but it was their resolute truth to nature which retained the interest and power to bring one to look at them again and again. It was to be remarked that the world came very quickly to appreciate the talent of Bewick at its proper worth; of the quadrupeds alone there were 12,250 copies sold in the artist's own lifetime, and the sale of the birds was far larger. Success was properly appreciated by Bewick, and it was pleasant to remember that throughout all his later years he was held in high honour by his neighbours. Many another point of merit and interest connected with Bewick might be discussed, but it was not necessary to do so further. Enough had been said to justify their eulogy on the artist they had met to honour. That day they had, with their own eyes, noted the fidelity of Thomas Bewick to the aspects of nature with which he was surrounded, and with this profoundly impressed on their minds they bowed with humble love and respect to the man and artist who had rendered them so much artistic and intellectual pleasure.

At Cherryburn the visitors saw, still standing behind the house occupied by the artist's descendants, the modest thatched cottage in which Bewick was born. It is now used as a cow-byre, but the brass plate over the doorway indicates that the house is very carefully preserved. People who have seen the artist's engravings of the modest dwelling can recognise it.

ARCHÆOLOGY IN THE ISLE OF WIGHT.

THE members of the Hampshire Field Club held a meeting in the Isle of Wight last week, which is described in the *Hampshire Advertiser*. The director of the excursion was Mr. G. W. Colenutt, F.G.S., local honorary secretary, and St. Catherine's Down was visited. The ancient lighthouse on the summit dates from the fourteenth century. The Rev. Father Davis then read the following paper on "The Hermitage of St. Catherine." Standing on what is known as St. Catherine's Down, we are, according to the latest map published by the Ordnance Survey, at an elevation of 781 feet above the sea-level, the highest and most conspicuous elevation in the island. There is reason to think that in the past ages it did not bear the name of St. Catherine's Down. In a deed of the time of Henry VII, and dated 1535, there is recorded the value of the living of Chale, and immediately following it there is an entry in Latin which it will be perhaps most convenient for me to give in English:—"The Chapel of Halydon. Roger Hall, lately chaplain, receives from the farm called glebe land and from tenths 4*l*." Halydon is good Anglo-Saxon for Holydown, and this, I think, must have been the name of the hill. In the Winchester registers there is a deed of Bishop Woodlock, dated October 1, 1312. In this deed the Bishop states that he admits Walter de Langebereeve to the hermitage upon the hill of Chale, in the Isle of Wight, which is to be built and repaired in honour of St. Catherine, and, continues the deed, "We give him faculties to celebrate the Divine sacrifice in the chapel which is to be constructed." This I think indicates that the chapel was dedicated to St. Catherine, and that it was built on the hill of Chale known as Halydon. According to the register already quoted, Walter de Longberew was admitted to the hermitage on the hill of Chale in the Isle of Wight on October 5, A.D. 1312. A few years later, in 1323, a chapel was erected on this spot by Walter de Godyton, and an endowment was given to it for one priest, who had to say mass for the repose of the soul of Walter de Godyton and of his ancestors. A light was also to be provided at night to warn off ships from approaching too near this dangerous coast. In the inquisition on the endowment of the chapel of St. Catherine on Chale Down Bishop Stratford states that Walter de Godyton also gave an endowment in order that the brightness of a nocturnal light might shine for those who were navigating at night in those dangerous parts of the sea where many dangers often arise for those navigating in darkness. We thus have, if not the history of the commencement of the lighthouse on St. Catherine's Down, the account of its permanent establishment and endowment. Here there shone for over two centuries the light whose warning must have been blessed by many an anxious mariner. Then there came the time of Henry VIII, and the hermitage and the priest and the warning light disappeared, as also did the endowment. The little tower alone has survived. In 1757 the foundations of the hermitage and chapel were excavated by Sir Richard Worsley. The lighthouse is a stone structure of four distinct storeys in height. Externally it is octagonal, but square within. Of the building erected by Walter de Godyton the only remains are the foundations. St. Catherine's Down offers on a fine day a most splendid prospect. The view is of marvellous extent, reaching over the greater part of the island, extending over the New Forest and the hills of Hampshire and the south coast as far as Beachy Head. It is stated

that on a clear day the high lands about Cherbourg are sometimes visible. The distance would be something more than fifty miles. As we look down on the seashore, though at the present time so beautiful and calm, we can easily imagine that it must be a most dangerous coast in stormy weather. Many and many indeed have been the shipwrecks that have taken place in Chale Bay. In the Patent Rolls, under date of 1311, is an account of a ship of Bayonne, freighted with white wine, of the Duchy of Aquitaine, which was sailing to Flanders, and which was wrecked here. A dispute arose about the ownership of the wines and of the ship. A plot was made at Newport by which certain parties conspired to say that the wines were not owned by the claimant. They caused him to be imprisoned at Winchester until, according to law, he was acquitted. A commission, dated from Newcastle, May 1314, was issued by the king to inquire into these proceedings. There was also an inquiry in the King's Court, as appears by the Abbreviation of Pleas, Hilary Term, 1315, as to the treatment of the cargo of the wrecked vessel by some of the landowners and inhabitants of the neighbourhood. Amongst them is mentioned the name of Walter de Godyton, who, if we may judge by his name, was in 1328 the founder of the lighthouse. The name of Goditon has not disappeared from the island. Under its modern form Gotten, it is the name of a farm at a short distance to the north-east of Chale Down. Of another wreck Worsley speaks in his history of the island. Referring to Chale Bay, he says that some years ago it was discovered that the sand under the cliffs was mixed with gold dust; this fact while engaged the country people to wash it in bowls and pans, as is practised in Africa and South America; but from a number of dollars occasionally found there it appears likely that both were the contents of some Spanish ship wrecked in this dangerous bay. The details of another wreck are of special local interest. On August 27, 1836, the West Indian *Clarendon*, 345 tons burden, sailed from Basseterre Road, St. Kitts, for England. She was commanded by Capt. Samuel Walker, had a crew of sixteen officers and men and ten passengers. She arrived off the coast of the Isle of Wight on October 10. During the night a fearful storm arose, and early on the morning of the 11th the *Clarendon* was cast ashore. With the exception of the second mate and two sailors, the crew and all the passengers were drowned. Capt. Walker and some of the passengers and the crew were buried in Chale churchyard. Lieut. Shore, of the 14th Foot, his wife and two daughters were buried at Newport. Amongst the passengers was a Miss Gourlay, the daughter of Capt. Gourlay, RN. Her body is stated to have been washed away and eventually cast ashore at Southsea, opposite her father's residence.

The Rev. G. W. Minns said he had been asked why the hill was named after St. Catherine. Catherine was a name of Greek origin, signifying pure. The saint lived at Alexandria, where with other Christians she was persecuted by the Emperor Masentius, who sent philosophers to argue with her, but she was able to confound them. After that the emperor, full of admiration for her beauty, made advances to her, which she resented, and finally he put her to death by the torture of the wheel, and her body is said to have been translated to angels to Mount Sinai. There were other hills named after Catherine in this county—one at Winchester and another at Christchurch.

Father Davis said that many hills were dedicated to St. Catherine, but there was no historical authority for the tradition just related.

In proposing a vote of thanks to Father Davis for his paper, Mr. Dale said he had disposed of the Papal document which had found its way into Mr. Percy Stone's hands on the Isle of Wight. A survey of 1566 showed a chapel on the hill, and a heap of fagots near, which might afford some evidence as to the method of illuminating the lighthouse. The move was then for Chale Church. At Chale a paper was read by Father Davis as follows:—"The Cartulary of Carisbrooke Priory states that Hugh de Gernon founded a church at Chale which was consecrated on December 1, 1114, by Walter Giffard, then Bishop of Winchester. Up to that time the church would appear not to have definitely belonged to any particular parish. It was claimed by Alwetus, the then priest of Carisbrooke, part of the parish of the church of St. Mary, Carisbrooke, in consequence an agreement was drawn up and signed on the day of the consecration, and in the presence of the bishop, the virtue of which Chale became a distinct parish. Hugh de Gernon endowed the church of Chale, and as a consequence the deed continues, "and the priest of Chale shall do the whole service of the church, both for the living and for the dead in bookes and vestments in defence and repairing, though it should fall to the ground." The question then once presents itself to our minds is what portion of the original church is to be found in the present building? I think, the case so far as one can ascertain, that no portion of the original church has survived, and would seem probable that in the thirteenth century

the first church was replaced by another, of which the pillars in the south aisle are the largest remaining portion. Later on in the next century considerable changes must again have been made. In the north porch there is a holy-water stoup, and in the chancel a piscina, which are apparently fourteenth-century work. The piscina was only put into its present position about thirty years ago. There is also in the south aisle the remains of an entry to a rood-loft, and beside a window in the north wall the remains of a niche. These I think belong to the Decorated period. In the fifteenth century very considerable alterations must have been made. The very fine tower, which is perhaps the most pleasing feature of the church, was then erected, either by the same architect, or after the model of the tower of Carisbrooke Church. The chancel arch and the windows both at the end of the chancel and at the end of the south aisle are modern insertions. The old windows of the church give the south aisle an east window or three lights, but without any tracery, and give to the chancel a square-headed window, also of three lights. In the belfry is a well supposed to belong to the fourteenth century, and on it the inscription "Sancta Margareta," with an "R" below it.

In the Papal registers there are three entries referring to the church of Chale, which our organising secretary, Mr. Shore, has been so good as to send to me. The first is as follows:—"Mandate to the Prior of St. Nicholas Exeter of Petition of John de Andevera, rector of Chale, to receive his resignation of Woggewell, which he presumed to hold after he got Chale, impose on him a salutary penance, and then induct and defend him in possession of the said church of Woggewelle. Dated Id. June Viterbo, 1258." John de Andevera had, and most probably innocently, broken the law which forbids a priest without a Papal dispensation to hold two livings. Woggewelle, take it, is the place now known as Ogwell in the county of Devon, about three miles from Newton Abbot. The church here is very ancient. The Pope also sent to John de Andevera the two following dispensations:—"Dispensation to John de Andevera, rector of Chale, to hold, after first resigning it, the church of Woggewelle, and an additional benefice with cure of souls. Dated Id. of June Viterbo, 1258." The third indult is as follows:—"Indult to John de Andevera, rector of Woggewelle and Chale, in the dioceses of Exeter and Winchester, to hold an additional benefice with cure of souls, and resigning one of them to accept another. Dated Non June om Viterbo A.D. 1258." We have no clue to the reasons why these permissions were given to John de Andevera. They were granted by Pope Alexander IV. According to the taxation of Pope Nicholas in 1291 the church of Chale is worth 20*l.* against the wall of the south aisle is a marble monument erected in 1704 by William Legg, rector of Greatham, near Petersfield, to the memory of his father and mother. Under the west window of the south aisle is a stone inscription stating that John Hieron, now spelt Hearn, was buried May 15, 1648. As you will see going round the church, descendants of his now living in America have in late years been very large benefactors to the church. In the same aisle is the handsome monument to Major-General Sir Henry Worsley. In walking over the churchyard you will notice several small tombstones ornamented with a very curious pattern. In the churchyard you will see the tombstones over the graves of the persons drowned in the wreck of the *Clarendon*.

The visitors then inspected the church, the pseudo-Latin inscription on a tablet under the east window of the south aisle being pronounced by the Rev. G. W. Minns to be a riddle. The brass tablet close to it records that Mr. George Hearn gave to the church in 1898 five windows and two bells, "and who being a native of the United States of America desired thus to commemorate two former rectors of this church, his ancestors, to show his pious reverence for the same and the unity of spirit existing in the Church at home and abroad." The party then proceeded to Chale House, one of the interesting ancient manorial residences which abound in the island. In the Mediaeval barn there Father Davis read the following paper on the Manor of Chale:—

We have at various times visited several of the manors in the Isle of Wight, built mostly in the reign of James I. or at the end of the reign of Elizabeth. But here at Chale we have a manor a portion at least of which dates back to the fourteenth century and to the reign of Edward III. In Domesday Book the name of Chale is given as *Cela*, and this is supposed to be derived from the Danish word "*schiele*," meaning the hollow bowl, a reference either to the shape of the bay or to the bow of the Chinese. The Manor is stated to be in the possession of William, the son of Stur. His daughter and heiress married Hugh Gurnon, into whose hands the Manor passed in the twelfth century. Probably by another marriage it subsequently passed into the possession of Richard de Longford. This was in the reign of Henry II. The Manor was then passed to his son Roger de Longford, who died in the third year of Edward III., 1330, and then passed to his son, John de Longford. This John was made Captain of the Island in the ninth year of Edward III., 1336. The Charter Rolls show

a grant of free warren at Chale to John de Longford in the seventh of Edward (1333). Inside the present house is a large hall now divided into rooms, but which was probably built by John de Longford. The hall was at the north end lighted by a transom window, which still remains. Under the hall was an undercroft which is now also divided into rooms. In 1509 Sir John de Langford, who then represented the family, died. His daughter Anne, his sole heiress, married Thomas Pound, of Southwick, Hants, and sold Chale Manor House to Sir Richard Worsley, the Captain of the Island in the reigns of Henry VIII. and of Elizabeth. Doubtless, before his time many alterations had been made, but of those he is supposed to have made there is one that is very conspicuous. He is supposed to have adapted the undercroft to the purposes of a kitchen, and to have added the immense fireplace which still remains. There have been many subsequent alterations, and in 1845 the old fourteenth-century roof was removed. We shall see in the present house some remarkably thick walls, but of their origin we know nothing. Shortly after John de Longford became possessed of the Manor in the year 1330, there occurred at Chale a most peculiar disturbance. Of the cause of it nothing is known. That it was of a most serious character the following extract from the Patent Rolls, as sent to me by our organising secretary, Mr. Shore, whose absence is much to be regretted, will show:—"Commission of Oyer and Terminer to John de Sponore, John Inge, John de Hampton and Master John de Hildeslee on complaint of John de Langford that Theobald Russell, John de Kyngeston, of the Isle of Wight, John son of John de Glamorgan, Robert Urry, Gilbert de Esteneye, William son of William de Borehunt of Portsmouth, and others broke doors and windows of his Manor of Chale, in the Isle of Wight, carried away his goods and assaulted his servants" (Patent Rolls 7. Edward III. June 30, 1333, dated at York). As it was in the year 1333 that Edward granted the free warren to John de Longford, it is possible that this disturbance had its origin in jealousy on the part of Theobald Russell of Knighton, John of Kingston and Robert Urry. As John de Longford was three years after made Captain of the Island, he was evidently in good favour with the king. On the west side of the house there stands a most beautiful specimen of a Mediaeval barn. The building is supposed to date from between the fifteenth and sixteenth centuries. It is 100 feet in length and 30 feet in width. The walls would appear, except in some minute degree, to be quite unaltered. The timbers of the roof have been replaced, one only of the original principals remaining. It may be on account of this barn that some persons have spoken of this house as the "Abbey House." Chale Manor never was an abbey, and, as far as its history is known, never belonged to any abbey.

The party then, by permission of Mrs Harvey, wife of the occupier, inspected the house, the large Tudor fireplaces and the transom window particularly interesting the antiquarians.

Before separating the Rev. G. W. Minns proposed a vote of thanks to Mr. Colenutt and the Rev. Father Davis for the interest they had given to the excursion.

This was accorded by acclamation.

ANCIENT STATUARY IN CHINA.

UNDER date "Hsiao-chang *via* Te Chou, Tientsin, North China, April 27, 1903," Dr. Sewell S. McFarlane sends the following communication to the Royal Geographical Society:—"In February, during one of my journeys in the south-west province of Chili, North China, I came across a number of stone horses, sheep, lions, &c., some in a fair state of preservation. They were in two parallel rows, and beside them were several 'petrified' Buddhist priests, supposed to be on guard. The people seemed to know nothing about them, and cared less. Upon inquiry among the gentry of the adjoining village, one old gentleman informed me that it was the entrance to a very old subterranean tomb of one of China's prime ministers, who lived under the Han dynasty. This would be about the year A.D. 25. Many years ago a tablet stood there, which they unearthed with the above stone figures, giving full particulars, but the disinterested inhabitants destroyed it 'as it was in the way of their cart track.' How the people came to unearth these huge statues is interesting. During the past generations the severe dust-storms experienced in North China have swept over the district and steadily but effectually buried out of sight the beautiful tomb and all its accompaniments. The inhabitants frequently dig out their land to make mud bricks for their houses, and in this manner the stone figures came to light. It is said there are a great many more of them ere one reaches the actual tomb. Had this been in England these ancient curios would have been excavated and a correct description published centuries ago. But in China the country folk, who simply live from hand to mouth, somewhat take after Gallio, of sacred writ, and 'care for none of these things.'"

NOTES AND COMMENTS.

ALTHOUGH one would give much gratification, we are not likely to have an exhibition of the late Mr. WHISTLER'S works this year. But the Copley Society of Boston, Massachusetts, intend to hold a memorial exhibition of his works next winter. The exhibition will open on Tuesday, February 23, 1904. In order that it may be as complete, representative and worthy of the fame of the artist as possible, the owners of WHISTLER'S pictures in America, as well as those in England and Paris, are invited to lend them for the occasion. For several years the Copley Society has had in view a Whistler exhibition, but it has been necessarily postponed until now. It seems appropriate that the first important memorial exhibition of the works of this eminent American artist, who lived so many years in Europe, should be held in America, and it will naturally be followed by other similar exhibitions in London and Paris. With this in mind it is hoped that many of his best pictures in Europe may be lent for this American exhibition, and that in turn those which are in America may be seen in Europe when the time comes.

THE camera has not been employed hitherto, so far as we know, as a weapon in strikes. The innovation is to be credited to the masons of Geneva. A great many of them are on strike, but, as happens in all countries, the steadiest men prefer to work. The Swiss laws are severe against any interference with the liberty of the subject, and the physical-force policy with which we are familiar in Great Britain dare not be exercised. There is, however, no law against taking snapshots of the operatives who have no liking for idleness and of exhibiting the prints as the portraits of cowards who are disloyal to trade organisations. If the men are sensitive, such records may have a terrorising effect, and in that way the end of the strikers will be attained. But if the experiment is ever tried here it is to be hoped summary methods will be adopted for dealing with the perpetrators.

If there is any part of Paris which should exemplify the latest improvements in illumination it ought to be the site of the vanished Tuileries, the gardens and the Place du Carrousel. The subject has been under consideration for some years, but the lighting is still unaccomplished. The delay is caused by the difficulty which often arises of defining the limits separating the duties of the State from those of the municipality. The Louvre is a Government building, including what remains of the Tuileries; the gardens are also State property; but then the roadways are supposed to be controlled by the Municipal Council. In one part the State denies the right of the municipality to interfere; in another part the latter wish to make the State pay all the expenses. It was supposed a compromise had been arranged, but the feud has been renewed on the question of privilege. The last step is to refer the whole subject to a commission, and in France, as in England, that means the postponing of a settlement for an indefinite period.

ILLUSTRATIONS.

CATHEDRAL SERIES: EXETER—DETAILS OF WEST FRONT.
ON July 3 we published a plate showing the whole west front of Exeter Cathedral. We now give an enlargement of the central division, which will suggest the character of the sculpture. It is not easy to discriminate between a series of ruined statues. But an effort was made by a Mr. DAVEY, who wrote a history of the cathedral with the assistance of JOHN CARTER, the architect, and they prepared the following list. The series is intended to be commenced on the left. In the upper row are:—Samuel, Samson, Jephthah, Gideon, Barak, Deborah, Noah, St. Matthew, St. John, St. Jude, St. Bartholomew, St. Matthias, St. Philip, St. Andrew, St. Peter, King Richard II., King Athelstan, St. Paul, St. John, St. James the Greater, St. Thomas, St. James the Less (modern), St. Simon, St. Luke, St. Mark, St. Augustine, King Ethelbert, St. Birinus, St. Boniface, Kynigils, Cwichelm, Kenwalch, Kentwald, Caedwalla, Ina, the last six being kings of Wessex. In the lower row following the same order are:—Canute, Edgar, Ethelred, Justice, Fortitude, Discipline, Edward II., Henry III., two

unknown bishops, Richard I., Henry II., Stephen, Henry I., William I. (modern), Robert of Normandy, William II., a king unknown, two bishops, John, Edward I., Edward III., Black Prince, Godfrey de Bouillon, Stephen, Count of Blois, Guy de Lusignan, Ethelwold, Alfred, Edward the Elder. The authors of the list admit that some of these names are doubtful. In the plate the upper row begins with Jude and ends with Simon, and the lower row with a figure of the Conqueror. Over the central doorway are St. Peter, Richard II., Athelstan and St. Paul. The early monastery of Exeter was dedicated to St. PETER. King ATHELSTAN was said to have founded a monastery for Benedictines about 932. The name of St. PAUL does not appear to have been connected with the monastery, but he was the usual pendant to St. PETER, and on that account may have been introduced. The introduction of RICHARD II. in so prominent a position may excite some surprise. The king was not remarkable for devotion to the Church. He reigned from 1377 to 1399. Now THOMAS BRANTYNHAM was consecrated Bishop of Exeter in 1370 and he died in 1394. If, as some inquirers believe, the sculpture was executed during his episcopacy it would be customary to give a prominent position to the reigning sovereign.

COTTAGES, HIGH STREET, BRIGHTON.

IN most Sussex towns the "High Street" is the leading thoroughfare, and in the older villages is also the most picturesque. Neither of these descriptions could be hitherto applied to High Street, Brighton, but the owner of a great part of the street (Mr. C. SCRASE, DICKINS, & CORTHURST) is about to rebuild on one side of the street in a manner which will go some way towards justifying the latter appellation. Our view illustrates this intended rebuilding the proposed houses being, with their tiled roofs, stone mullioned windows and other characteristic features, a very great improvement on the commonplace old cottages now occupying the site. The architects responsible for the design are Messrs. CLAYTON & BLACK, of Brighton.

HOUSE AT EAST GRINSTEAD.

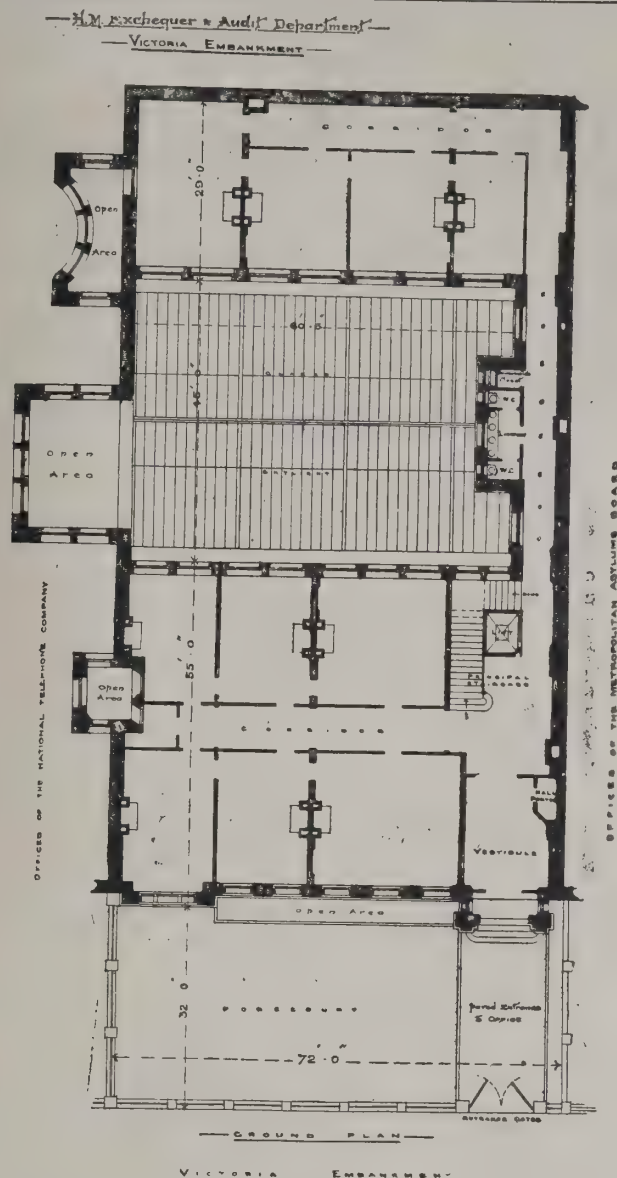

THIS house was erected for Mr. F. C. POYNTER, M.P., just outside the town of East Grinstead. The facing bricks were of a russet brown colour, with worn burnt headers specially selected from the Nut Hatch brick-kiln. The stone dressings, &c., were of Hackenden stone obtained in the neighbourhood, and the roofs covered with stone heeling brought from Wiltshire. The external woodwork was of English oak cut from old beams and built solid. The contractor was Mr. CHARLES RICE, of East Grinstead.

PROPOSED PRINCIPAL GATE TO ST. HUGH'S MONASTERY, PARKMINSTER, SUSSEX.

THE Monastery of St. Hugh, Parkminster, Sussex, is the largest in the world, and belongs to the Carthusians (Grande Chartreuse). It was designed about thirty years ago by the French architect, M. NORMAN. The buildings are in the Romanesque style and the church is simple but grand. In the design for the entrance Romanesque is adopted, with the exception of the arch of the carriage entrance, which is Florentine. The lodge lies on the right-hand side of the proposed new gates. Since the expulsion of the Carthusian Order from France a good many of the monks have been transferred to Parkminster and also to Italy, Austria and Belgium.

RESIDENCE AT HOVE.

THIS detached house for the Rev. DAVID DAVIES occupies a position which commands a close and uninterrupted view of the Sussex county cricket ground. The new road in which it stands will, when the remaining and adjoining houses are built, complete the circle of residences (mostly occupied, it is to be supposed, by cricket enthusiasts) which enclose this, the finest run-getting ground in England. The house, with the specially designed interior fittings, is being carried out under the direction of Messrs. CLAYTON & BLACK, architects, of Brighton.

A view of the building was published last week.

SALE OF CITY CHURCHES.

PARLIAMENTARY paper has been issued comprising the number of churches in the City of London pulled down or condemned during the period from August 2, 1894, to December 31, 1902, the gross sum realised by the sale of the churches, the items of expenses, such as solicitors and auctioneers' charges, and the cost of the removal of the bodies buried within the church, and the net sum produced. It also includes the new churches built out of the proceeds, their situation and cost, and the purposes to which the parochial endowments have been applied. Four churches are mentioned in the return, viz. St. Michael, Wood Street, St. Michael, Bassishaw, St. Bartholomew, Moor Lane, and St. George, Botolph Lane. The gross result of the sale of St. Michael, Wood Street, was £31,617. 4s. 9d. (which included £117. 4s. 9d. as the price paid for the fittings); the charges, about which the return gives no details, amounted to £670. 9s. 7d. The church erected out of the proceeds is St. Andrew and St. Michael, East Greenwich, where £14,783. 15s. 6d. has been paid for the church and parsonage house, further sums being still required of the capital sum. The parochial endowments of St. Michael, Wood Street, passed to the united benefice of St. Andrew and St. Michael, East Greenwich. Out of the proceeds of the sale of St. Michael's the following were also made:—Small compensations to the organ-blower and sextoness for the loss of their offices; £2,000. transferred to the Union of Benefices Fund; the induction fees and first-fruits of the first incumbent appointed to the united benefice; £4,000. for a parsonage for the united benefice; £600. for maintaining the old burial-grounds of St. Mary, Staining, and St. Olave, East Street; £1,000. for improving St. Alban's, Wood Street; £5,043. 15s. for the purchase of India 3 per cent. stock to

provide an income of 150*l.* for the incumbent of St. Andrew and St. Michael, East Greenwich.

The church of St. Michael, Bassishaw, was sold for £36,014*l.* 17s. 2*d.*, less £773*l.* 6s. 9*d.* for "charges." The new church of St. Michael, Edmonton, was erected at a cost of £10,000*l.* The parochial endowments were transferred and annexed to St. Lawrence, Jewry, with which the parish of St. Michael, Bassishaw, was amalgamated. The following further appropriations were made in this case:—£4,000*l.* transferred to the Union of Benefices Fund for defraying the cost of the removal of human remains from St. Michael's; £4,000*l.* for a parsonage for the united benefice of St. Lawrence, Jewry, &c.; £500*l.* for improvements to St. Lawrence Church; £2,000*l.* for a parsonage for the new church of St. Michael, Edmonton; £12,000*l.* for erecting the church of St. Aldhelm, Edmonton, and for completing the church of St. Peter, Lower Edmonton.

The price realised by the sale of St. Bartholomew, Moor Lane, was £20,420*l.*, the "charges," as far as at present known, being 30*l.* Of this sum £9,000*l.* served to build the new church of St. Bartholomew, Stamford Hill. The endowments were partly annexed to St. Giles, Cripplegate, the mother church of the united parishes, and partly went to provide a pension for the ex-incumbent of St. Bartholomew; the latter portion will ultimately provide an income for the new benefice at Stamford Hill. The following additional appropriations were made:—£4,252*l.* 4s. 6*d.* to provide part of the ex-incumbent's pension and to be used for other purposes on his decease; £736*l.* 13s. 4*d.* to provide compensation to the church servants, of which £666*l.* 13s. 4*d.* will ultimately be available for other purposes; £2,000*l.* to provide a parsonage for the new church at Stamford Hill.

No details can as yet be given in regard to St. George, Botolph Lane. Sir A. de Bock Porter adds that in these cases the cost of removing and reintering bodies is, under section 22 of the Union of Benefices Act, 1860, defrayed out of a special fund. The sum expended in the case of St. Michael, Wood Street, was £936*l.* 2s. 4*d.*, and in that of St. Michael, Bassishaw, £2,444*l.* 2s.

CHRIST CHURCH AND THE SEE OF OXFORD.*

Diocese of Oxford.

IN the reign of King Cynegils, A.D. 634, Birinus came to England, having first expressed to Pope Honorius his intention to "scatter the seeds of faith" among the Pagans. He commenced his mission amongst the West Saxons, and soon after converted the King and many of his people to Christianity. Bede records that Cynegils gave to the Bishop, for the establishment of a see, the City of Dorchester, the Roman Durocena and the modern Dorchester. Here Birinus built his Cathedral, and by his pious labours called many to the faith. He died in 650, and was buried in his Church. In 705 the large diocese of Wessex was divided into the two sees of Winchester and Sherborne, Oxford being assigned to the former. About a century later Dorchester was re-established as a Mercian see and remained so until 1087, when Remigius of Fécamp, who had been appointed Bishop by the Conqueror, transferred the seat to Lincoln, where he built a new Minster on the site of an earlier Church, which he called the Church of the Blessed Mary of Lincoln, connecting with it a foundation of secular canons. The Bishop did not live to see the consecration of his Cathedral, which took place in 1092. Upon the creation of six new bishoprics by Henry VIII., two were taken from the diocese of Lincoln, one being bestowed, by letters patent granted in 1542, on Oxford. Robert King, the last Abbot of Oseney, was appointed the first Bishop of Oxford with his seat in the Church of St. Mary at Oseney Abbey. At the dissolution Oseney met with the same fate as the other monasteries, and in 1546 Henry transferred the see to St. Frideswyde's Church, which, together with Wolsey's foundation, he reconstituted as his College and Cathedral. Henry granted Gloucester Hall, now Worcester College, to Bishop King for his Palace, which he occupied for about three years, when he took up his residence in the house in St. Aldate's Street, near the Trill Mill stream, known as "Bishop King's Palace," where he died in 1557. He is supposed to have built the house, his arms and those of Edward VI. appearing on the richly decorated ceilings. The half-timber and pargetted front in Rose Place was rebuilt in 1628 and is a good specimen of this style.

Oseney Abbey

was founded in 1129 by Robert d'Oily the younger as a house of Augustinian Canons Regular, and incorporated as a Church and College by Stephen in 1149. The magnificent pile of buildings, for which it became so renowned, was erected about 1247. It was designed on a sumptuous scale, and was one of the finest Abbeys in the Kingdom. The Church was dedicated to the Blessed Virgin Mary. It had double aisles, was 352 feet long by 100 feet wide, and in it were no less than twenty-four altars. There were two lofty towers, one at the crossing and the other at the west end, the latter containing the beautiful peal of bells now at Christ Church, "Great Tom" being in the central tower. In 1542 Henry VIII. created the new see of Oxford and made the Abbey Church the Cathedral of the diocese, but it only retained the dignity for four years, when the Abbey was dissolved and the see removed to Christ Church. The buildings seem soon to have fallen into ruins, for we see them represented as roofless in Aggas's map (1566). There is now nothing left but a stone doorway and a chamber with a fine old timber roof, which has apparently been shortened at each end. During some alterations in the mill now standing on the site, a short time ago, some of the foundations were exposed and several very fine carved capitals and mouldings were found. A few are left on the spot, but I understand the best specimens were removed to the Ashmolean Museum.

Christ Church Cathedral.

The history of the Cathedral dates back to the eighth century, when a Prince named Didan who lived at Oxford had, by his wife Safrid, a daughter called Frideswyde. Her father built her a Church within the City of Oxford which he dedicated to the honour of the Holy Trinity, the Virgin Mary, and All Saints. He also "erected other edifices adjoining to the Church," and settled lands upon the Nunnery. Frideswyde, who was a woman of great piety, took the veil, induced "twelve virgins of noble extract to follow her," and here she lived doing good work and performing many miracles. Some time after the death of Frideswyde the nuns were removed, the buildings being occupied and the work carried on by a body of Secular Canons. At the massacre of the Danes by the West Saxons, which King Ethelred II. had commanded to take place on St. Brice's Day, 1002, those living about Oxford sought refuge in the tower of St. Frideswyde's Church. After some resistance they were burnt in the tower, and at the same time the roof and other portions of the Church were destroyed. In 1004 Ethelred commenced the restoration of the building, and of his work a great deal may now be traced. Prior to the

Norman Conquest the Seculars were suppressed and the Priory granted to the Benedictine Monastery of Abingdon, subsequently to Roger, Bishop of Salisbury, and finally it was restored in the reign of Henry I. to the Canons Regular of St. Augustine. During this time the buildings became in a very ruined condition. The first Prior was Guimond (1120-4), and probably he restored the roofs and some of the other dilapidations. Sir G. G. Scott ascribes the Norman doorway of the Chapter House to him. During Guimond's time a school was founded in connection with the Priory, the buildings occupying a position in about the centre of the present great quadrangle. Inns and Halls were subsequently acquired, notably Vine Hall and Peckwater Inn, that now form part of the College buildings. Robert of Cricklade, the next Prior (1141-80), completed the restoration, the later Norman work, including the presbytery and clerestory, being probably some of his work. He had the relics of St. Frideswyde translated "from an obscure place on the north side of the choir." They were again translated in 1289 by Robert de Ewelme, the Prior, the beautiful marble tomb now in the Lady Chapel being made for the purpose. At the Reformation (1538) this was demolished, but portions were recovered from various places and set in their present position. The upper part, which was of wood, utterly lost. The Priory was suppressed by Wolsey in 1540, who obtained a Bull from Pope Clement VII. for the purpose, and in the following year the Church of St. Frideswyde became the Chapel of his new foundation, Cardinal College. He made way for the building of his great quadrangle he ruthlessly sacrificed three bays of the nave. In 1546 Henry VIII. recreated the foundation under the title of "The Cathedral Church of Christ in Oxon," and made it the site of the new created See of Oxford. Since then it has served the double purpose of Cathedral and College Chapel. The building suffered a great deal at the hands of Brian Duppa, who was Dean from 1629 to 1638. He removed the old stalls to the Latin Chapel and replaced them with high seats backed with panelling of oak, for which he sacrificed the monuments on the pillars. He paved the choir with black and white marble and other parts with stone slabs, removing the old memorial-stones many of which were lost or destroyed. Ant. Wood says "having most of them Saxon inscriptions on them." He removed away the beautiful Gothic tracery from the windows, substituting others of two lights, removed the priceless old glass of the Priory Church, representing stories from the life of St. Frideswyde, and the Arms of the Benefactors, and inserted Dutch glass, by Abraham Van Ling. The side Chapel, separated by stone screens and closed the west end of the choir with an organ-loft. Little or nothing more was done to the Cathedral until 1856, when Dean Liddell commenced his restorations that have been so well carried out. Under the direction of Mr. John Billing, Duppa's high pews and panelling were replaced by the present stalls, and the gallery and organ-loft were removed. In 1870 Sir G. G. Scott was consulted, and in his able hands the building was restored to its present admirable condition. At the east end he took out the great window that Duppa had altered from a five-light to a three-light, and substituted the present wheel window, with intersecting arcading, and two round-headed windows below, carrying out the original design of Robert of Cricklade as far as was possible from conjecture and traces of original work that he discovered. The other windows were restored in the same manner. Among other restorations and improvements the lantern storey of the tower was opened and the bells removed to the new belfry constructed by Mr. Bodley in 1870 over the hall staircase. At the same time a new bay was added to the nave, forming an ante-chapel, and the western porch leading from Tom Quadrangle was thrown down under the direction and from the designs of Mr. Bodley.

The best view of the exterior is to be obtained from the garden of the Professor of Pastoral Theology. From here the tower and spire and the north transept, with its two pinnacles and turrets, are well seen. The lower storey of the tower is Norman, the belfry and spire being Early English. The spire is particularly interesting as being perhaps the earliest in England. The Latin Chapel, with its four fine Decorated windows and buttresses, is most picturesque. Passing to the east end, we see the three Saxon arches discovered by Mr. Park Harrison in the centre one being partly concealed by a flat Norman buttress. In front of these he also discovered, by excavating the foundations of three apses into which the arches would have led. These are now covered up, but Mr. Harrison made careful plans of them, which have been published with a paper he read before the Royal Archaeological Institute in 1887. The south side is the Cathedral cemetery, where repose the remains of Dr. Liddell and his daughter Edith, Phillip Edward Pusey, son of Dr. Pusey, Mrs. Paget, wife of the Bishop of Exeter, Dr. Moberley. The beautiful flamboyant tracery in the window of the Lady Chapel is best seen from here, also the east end of the Chapter House. The slype passing under the vestry in the south transept leads from the cemetery to the cloisters.

* A paper read by Mr. Frank E. Spiers before the members of the Upper Norwood Athenæum.

On entering the Cathedral by the new western porch the first impression is that you are in a building of great architectural beauty and interest, but of unusual proportions, and you feel what has been lost by Wolsey's destruction of the three western bays of the nave. The nave is probably the work of Robert of Cricklade, the restoration having been commenced by him after the Pope's Charter had been secured in 1158, though it may have been commenced by Guimond, the first Prior of the Augustine Canons Regular. The clerestory windows are probably Prior Robert's. The roof of the nave is sixteenth century, that of the transepts being a little earlier. The tower is Transitional, and, it will be noticed, is not square. The east and west arches are round, the north and south being pointed. The choir has four bays and a presbytery. It is probably of the same period as the nave, excepting that, according to Mr. Park Harrison, two of the capitals are far older than the others, and by their weathered appearance and careful comparison of details in Saxon MSS. with the carving in these capitals, he puts them down as part of Ethelred's restoration in 1104. He also points out a capital in the south choir aisle as Saxon and attributes one of the clerestory windows in the South Transept to Ethelred. These statements are disputed by high authorities; I therefore give them for what they may be worth as it is an interesting question. The tracery of the choir is deeply recessed with delicate lantern pendants, and is said by Fergusson to be the best example of its kind in England. In the east wall of the north choir aisle and the Lady Chapel we find the only visible remains of St. Frideswyde's Church. Here are the two built-up arches, with indications of a centre arch covered by a pillar, already alluded to as having been discovered by Mr. Park Harrison. In the apse to which the southernmost of these arches led, it is conjectured the remains of St. Frideswyde were first laid, and that this is the "obscure place" in which they remained until their translation in 1158 by Robert of Cricklade. The Latin Chapel was for some time used for the lectures of the Regius Professor of Divinity until Dr. Liddell had it refitted as a chapel. The west bay formed part of the north transept aisle, the second bay is thirteenth century, the third and fourth having been added in the fourteenth century, when the vaulting was put up. Some of the stalls belonged to the Priory church, and were removed from the choir by Dean Duppa. There are also some that it is supposed were made for Wolsey's chapel, bearing the Cardinal's hat. The Jacobean pulpit formed at one time the Vice-Chancellor's seat in the choir. The altar table was until 1890 in the presbytery. When the chapel was being refitted an arched recess was found in the north wall that may have been the tomb of the founder, or more probably an Easter Sepulchre. The south choir aisle is of Ethelred's time. St. Lucy's Chapel, which is now used as a baptistery, is Norman, the east window being decorated with rich flamboyant tracery. The font is the first ever used in the cathedral, and was placed here in 1882. It is of Rosso-antico marble with a lofty cover of oak elaborately carved from designs by Mr. Bodley. The vaulting of the aisles of the nave and transept is twelfth century. The reredos was presented anonymously in 1881; it is in red Dumfries sandstone with figures in Rosso-antico marble carved by Brindley from designs by Mr. Bodley. The centre subject represents the crucifixion. The high altar is of cedar wood, the beautiful embroidered super-frontal being the work and gift of Dr. Liddell's daughters. The silver gilt alms dish and the candlesticks are dated 1661, and the Bible and Prayer-Book 1634. The lectern is a very handsome specimen of brasswork and is the gift of the Rev. T. Vere Bayne and the Rev. H. L. Thompson. The pulpit and canopy of carved oak is of good Jacobean design. The organ screen, which is now at the west end of the nave, is the same that Dean Duppa erected, and contains an organ of fine tone, built by Willis & Son in 1884. As I have described earlier in my paper, the shrine of St. Frideswyde was destroyed during the Reformation (1538). While the restorations of the Cathedral by Dr. Liddell were being carried out, various portions of the marble shrine were recovered, many of them lining a well in the Cathedral grounds, others built into the walls and in many other places. These were collected and have been very carefully fitted together. The restored shrine now stands on the south side of the Lady Chapel, and there is sufficient to show it must have been of great beauty. The carving, which represents the flowers and plants of the neighbouring country, which Frideswyde loved so well, is exceedingly delicate and effective. The watching chamber is of the fifteenth century. It is not known for what purpose it was constructed. Probably a watching chamber for guarding the precious jewels on St. Frideswyde's shrine. Some imagine it may have been intended as a third shrine of the Lady Saint. It is a beautiful specimen of Perpendicular work, the lower part being of finely carved stone forming an altar tomb and canopy, on the tomb being the matrices of two brasses. The upper chamber is of wood most delicately carved. Other monuments in the Lady Chapel are to the memory of Elizabeth Lady Montacute,

Alexander de Sutton, Prior of St. Frideswyde's 1294 to 1314, Sir George Nowers (d. 1425) and Robert Burton (d. 1639). In the south choir aisle, to Bishop King (d. 1677), Bishop Mackarness, Prince Leopold, and a brass to Stephen Pence (d. 1587). In the south transept, to Viscount Brownker (d. 1445). In the south nave aisle, to Dean Corbet (d. 1688) and James Zouch, Monk of the Priory 1503. In the nave, to Dean Aldrich (d. 1710), Bishop Berkeley (d. 1753), and Dr. Pusey (d. 1882). In the ante-chapel, to Dean John Fell (d. 1684), the only Dean of Christ Church who became Bishop of Oxford, and Dean Gaisford (d. 1855).

The oldest glass in the Cathedral is in the east window of St. Lucy's Chapel; it dates from early in the fourteenth century and is very fine. Other fourteenth-century glass spared by Dean Duppa is in three of the side windows of the Latin Chapel. One of the most interesting windows is in the south choir aisle representing Bishop King, with a view of Osney Abbey in the background, attributed to Van Ling. At the west end of the north aisle is the only window put up by Dean Duppa that is left. It is of very rich colouring and represents Jonah sitting under his gourd, with a view of Nineveh in the background. The east windows of the Lady Chapel and the north and south choir aisles are by William Morris from designs by Sir Edward Burne-Jones. That in the Lady Chapel is to the memory of Frederick Vyner (d. 1870), and represents Samuel, David, St. John and Timothy; in the north aisle is the "St. Cecilia" window, presented by Dr. Corfe in 1873, and in the south aisle the "St. Catherine" window, in memory of Edith Liddell (d. 1876). In the Latin Chapel is "St. Frideswyde's" window. This is from one of Burne-Jones's earliest designs, and is very rich and beautiful in effect. It represents scenes from the life of the Saint, and was carried out by Powell of Whitefriars. Another of Burne-Jones's early works is at the west end of the south nave aisle, and represents "Faith, Hope and Charity." It is to the memory of Edward Denison, the founder of the Oxford settlement in the East-end of London. Clayton & Bell are responsible for the glass in the wheel window at the east end given by Dr. Liddell, and the two round-headed windows given by Sir John Mowbray. Also the half-window in the south transept in memory of Dr. Liddon, the large window in the north transept and several windows in the aisles. The glass in the clerestory windows of the two transepts is by Henry and Alfred Gerenté (1854), and was removed from the former east window.

Christ Church.

Cardinal Wolsey obtained from Henry VIII., in July 1525, the Royal license to establish a college of learning and piety at Oxford. He had in the former year acquired the Papal authority for the suppression of twenty-two religious houses for the benefit of his Foundation, one of them being the Priory of St. Frideswyde in Oxford, and upon the site of the Priory he founded "Cardinal College," dedicating it to the Holy Trinity, the Virgin Mary, St. Frideswyde, and All Saints. The foundation-stone was laid on July 15, 1525, by Dr. John Longland, Bishop of Lincoln, Oxford being then in the diocese of Lincoln.

The plan designed by Wolsey for his buildings took the form of a large quadrangle, 264 feet long by 261 feet wide. On the south side he built the Refectory, or great Hall, the grandeur of which is perhaps only surpassed in this country by Westminster Hall. The other buildings were devoted to lodgings for the Dean, Canons and Scholars, with an entrance gateway on the west side. Wolsey apparently never intended that St. Frideswyde's Church should be the Chapel of his College, for he commenced building what would have been a magnificent Chapel, occupying nearly the whole of the north side of the quadrangle, but the walls never rose higher than about 7 feet from the ground. The Kitchen, an important part of the establishment in those days, was built at the back of the Hall. The Chapter House and Refectory of the Priory were preserved, and the domestic buildings were utilised for various purposes of his College. The three western bays of the Cathedral and the west side of the Cloisters were unfortunately sacrificed by Wolsey, to make room for his new buildings, as well as the parish Church of St. Michael's at the south gate and portions of the old city wall.

Wolsey gave an elaborate code of Statutes to his College, and liberally endowed it with his own private wealth and funds obtained by the suppression of the Monasteries. Dr. John Higdon, President of Magdalen, of which College Wolsey had been a Fellow, was appointed the first Dean, and temporarily lodged in the rooms of the Prior of St. Frideswyde. On Wolsey's disgrace in 1529 his College was forfeited to the Crown, and soon afterwards dissolved.

Henry refounded the College by letters patent dated July 18, 1532, under the title of "King Henry VIII's College in Oxford," as a religious foundation, comprising a Dean and twelve Canons; apparently it was not devoted to learning. On May 20, 1545, the Dean and Chapter surrendered the foundation to the King, and on the same day the Commissioners also received the surrender of the Cathedral Church

of Christ and the Blessed Virgin Mary at Oseney, that had three years previously been created the see of the Diocese by Henry VIII.

The foundation of Christ Church dates from November 4, 1546, when it was created under letters patent of the King, who united with it the Episcopal See and designated it "Ecclesia Christi Cathedralis Oxon.; ex fundatione Regis Henrici Octavi." It thus became a Royal Foundation. Richard Cox, who had been nominated to the Deanery of the Cathedral at Oseney four years earlier, was appointed the first Dean, and Wolsey's buildings were conveyed to him and eight Canons with an endowment of 2,200*l.* per annum, the Dean and Chapter to maintain Professors of Theology, Hebrew and Greek—to be appointed by the King—one hundred students, and such officials and servants as were necessary for the College and Cathedral. In 1664 an additional studentship was created under the bequest of William Thurston, making the number one hundred and one. The establishment in this form remained more or less the same until 1858. Dean Cox was a strong supporter of the reformed religion, and was deprived of his position by Queen Mary. It was under Richard Marshall, his successor, that the degradation of Archbishop Cranmer took place on February 14, 1555, "in a yard outside the Cathedral," probably the Cloister garth.

An important event in the history of Christ Church took place in 1567, when Queen Elizabeth issued a statute ordering that three of its studentships should in future be assigned to boys educated at the Royal Foundation of St. Peter's, Westminster. This has always had a most beneficial influence upon the College, many of its most distinguished men having been Westminster students, including no less than sixteen of its Deans.

All regulations for the government of the College were made from time to time by the Dean and Chapter, no regular code of Statutes having been given by the Royal Founder.

In 1642 Lord Saye and Sele, acting under the instructions of the Parliamentary party, seized all the College plate he could lay hands on, and later the Chapter gave the remainder of their plate to be coined into money for the King's use. Christ Church was thoroughly loyal to the King; John Fell, who was Dean from 1660 to 1686, wrote "Most of the academicians exchanged the gown for the military coat and square cap for the helmet. . . . Out of the hundred students twenty were officers in the King's Army, and the rest, almost to a man, were indefatigable in protecting the dwellings of the inhabitants."

As previously stated, few changes took place in the establishment until 1858, when Dr. Liddell was at the Deanery. At this time the reforms introduced by the Oxford University Commissioners came into operation, and important alterations were made in the government of the College. By the Christ Church ordinance dated June 5, 1858, two Canonries were suppressed and the number and title of studentships were altered to 28 senior and 52 junior students, 21 of the latter to be from Westminster. Later, by the Christ Church Oxford Act, 1867, the senior students were recognised as part of the governing body—a position similar to that of Fellows in other Colleges—in conjunction with the Dean and Canons. In 1882 a further titular alteration was made, when the senior students were termed Students, and the junior Scholars.

The main entrance to Christ Church is in the centre of the west front in St. Aldate's Street. The gateway, lower part of the tower, the buildings to the south and a portion of those to the north were built by Wolsey. The gateway arch has groined vaulting with shields bearing, among others, the arms of Henry VIII., Charles I., Charles II. and Wolsey. Samuel Fell (Dean 1638-48) completed the building of the west front and commenced the north side of the great quadrangle, substituting the present Canon's residences for the Chapel, of which Wolsey had laid the foundations, but his work was stopped by the Civil War. John Fell, who was appointed Dean (1660-86) after the Commonwealth, completed the work his father had commenced in the quadrangle. He formed the present terrace by excavating the centre area, making use of the earth removed, for the formation of the celebrated Broad Walk, planting on either side seventy-two elm trees, some of which still survive. In the centre of the quadrangle he placed a fountain, where, prior to the Reformation, had stood a cross, from the steps of which Wyclif is said to have preached. The base of this cross is now preserved in the gallery over the vestry of the Cathedral. In 1659 Dr. Anthony Radcliffe gave the historic figure of Mercury that took the place of the globe and serpent of Dr. Fell's fountain. The beautifully proportioned tower over the gateway was added by Dr. Fell in 1682 from the design of Sir Christopher Wren. In it he placed the celebrated bell "Great Tom," which originally hung in the central tower of Oseney Abbey. From there it was removed, at the Dissolution, to the Cathedral, where it remained until Dr. Fell had it recast and hung in what has since been known as "Tom Tower." It is 7 feet 1 inch in diameter, and weighs over seven tons. It was first rung on May 29, 1684, and from that time it has continued

to toll every evening at nine o'clock, one hundred and one—number of students at that time in the foundation—and tolling has been the signal to undergraduates of the closing of all the College gates.

Dr. Liddell (Dean 1855-91), who did so much to add to the æsthetic appearance of Christ Church, slightly lowered the terrace of the great quadrangle, exposing the bases of the shafts of Wolsey's structure. He had the buildings refaced with Taynton stone, and made a special feature of showing the springing of the arches projected by Wolsey to form a cloister round the quadrangle. He also replaced the balustrade seen by Dean Fell with the present battlements, restoring Wolsey's design. In some of the staircases on the west side may be seen the original oak stairs and doorways, with Wolsey's devices in the spandrels above. Dean Liddell built the tower over the Hall staircase, from the designs of Mr. Bodley, in which he placed the well-known peal of Christ Church bells, twelve in number, seven of which came from Oseney; he also added the parapet and pinnacles above the Hall.

The approach to the Hall is by a grand staircase, the vaulting of which is an exceedingly fine specimen of the tracery, springing from a slender clustered column in the centre. Christ Church is indebted to Dean Samuel Fell for the beautiful vestibule. The name of the architect was Smith, but more concerning him is not known.

The Hall, completed by Wolsey in 1529, is a noble apartment 115 feet long, 40 feet wide and 50 feet high. It has a fine hammer-beam roof with lantern pendants, and is wainscoted with oak panelling decorated with shields bearing the arms of the Royal Founder, Wolsey, Oseney Abbey, the University &c. Some of the original glass remains in the west window. The roof was partly destroyed by fire in 1720, caused by a burning on the central hearth of boughs that had been used for the Christmas decorations, by which the louvre was ignited. The present roof was then put up, following Wolsey's design, but without the louvre, and the fireplaces were inserted. George I. gave one thousand pounds towards the cost. An exceedingly interesting collection of portraits adorn the walls, the following deserving special attention:—Henry VIII. (Holt), Queen Elizabeth (Zuccheri), Cardinal Wolsey (Holt), Archbishop Markham (Reynolds), Bishop Corbet (Vanderpool), Dean Aldrich (Kneller), George Canning (Lawrence), Bishop Hooper (Hogarth), John Locke (Lely), Dr. Pusey (Richman), Archbishop Robinson (Reynolds), Lord Mendip (Gibson), Chief Baron Skynner (Gainsborough), Dean Liddell (Watts), W. E. Gladstone (Millais), Dr. Liddon (Herkness), and John Wesley (Romney). Christ Church Hall has been honoured by the presence of Royalty on many occasions. In 1533 Henry VIII. was entertained at a grand banquet; Queen Elizabeth witnessed stage plays in 1566 and 1592; Charles II., Queen Anne and George III. were all entertained here; and in January, 1644, when Parliament met at Oxford, Charles I. opened the Session in Christ Church Hall, and in 1681 the House of Lords sat in the Hall. The large Lecture room adjoining the Hall was erected in 1829.

The kitchen is a room of grand proportion 40 feet square. It was the first part of his College finished by Wolsey. It remains almost in its original state, excepting that the huge fireplaces he placed at the sides have been modernised, and the addition of chimneys. The old gridiron that used to occupy a place in the centre, under the louvre, is preserved and hung upon the walls.

The old Monastic Refectory was converted by Wolsey into a Library. Part of the interior was fitted up by Dean Aldrich (1767-76) as lodgings for the Westminster student body, a portion overlooking the Cloisters being retained for the purposes of the Allstreet Library, containing a very valuable collection of theological works. On the south side may still be seen the old open-air pulpit built into one of the buttresses, now closed up.

The Cloisters belonging to St. Frydeswyde's Priory, built in 1499; the western side was demolished by Wolsey to make room for his College. They were very carefully restored in 1871 by Dean Liddell, who threw open the north side, which had been enclosed and used as a muniment room, and refaced the vaulting and the tracery of the windows. He also had the earth excavated to expose the shafts of the buttresses, the same time bringing to light the foundations of some of the Monastic buildings.

The Chapter-house on the east side of the Cloisters entered by a fine Norman doorway with zigzag moulding, the interior is a very perfect specimen of Early English, the building having been destroyed by fire in 1190. It is an oblong room of four bays with vaulted and groined ceiling. At the east end is an arcade of five arches, pierced for windows. The foundation-stone of Wolsey's College at Ipswich (dated 1529) is inserted in the east wall. On the south side is a staircase leading to a very comfortable room above, with good Jacobean panelling, in which the meetings of the Chapter are now held. It contains interesting portraits of Henry VIII., Elizabeth I., Mary, Dean Samuel Fell, Dean Aldrich and Peter Martineau.

The Anatomy School to the south of the Hall was erected by Dean Gregory in 1766 from the designs of Mr. H. Keen. It is now used as a chemical laboratory.

The Meadow Buildings facing the Broad Walk were built by Dean Liddell in 1863-65, from designs by Mr. Thomas Deane, of Dublin, on the site of the old chaplain's lodgings and Fell's buildings. The floral embellishments were carved by workmen trained under Mr. Ruskin, and are very good in design. Cyril Jackson, who was Dean from 1783 to 1809, having in view the necessity that would some day arise for new buildings, initiated a building fund that by Dr. Liddell's time had attained to a considerable amount, and with this fund the Meadow buildings were erected.

The archway known as "Kill-Canon" leading from the great quadrangle to Peckwater was made by Dr. Samuel Fell, who sacrificed a portion of his garden for it. Above the archway facing the quadrangle is a statue of Dean John Fell, and on the other side of Dean Liddell.

Henry Aldrich (Dean 1689-1710) rebuilt the north, east and west sides of Peckwater quadrangle in 1706 from his own designs, the greater part of the cost being defrayed by a bequest of Dr. Anthony Radcliffe, a Canon of Christ Church. This quadrangle occupied the site of Vine Hall and Peckwater Inn, given to the Priory of St. Frideswide in the reign of Henry III.

The Library, completing the quadrangle on the south side, was commenced in 1716 from designs by Dr. George Clarke, of All Souls College, but was not completed until 1761. It was originally intended to have an open piazza on the ground level, but this was enclosed to form a gallery to hold the collection of pictures bequeathed to Christ Church by General Guise, who died in 1765. In the vestibule is the seated figure of Dean Cyril Jackson, by Chantrey, and on the staircase a fine statue of John Locke by Rysbrack. The Library is a fine proportioned room, 142 feet long by 30 feet wide, with a coved ceiling decorated with rich mouldings. The book-cases and galleries are of Norwegian oak. There are many valuable illuminated MSS. and other rare and interesting works, among them Wolsey's "Lectionary," 1528, a MS. of Wyclif's Bible and of haucer, and Cavendish's "Life of Wolsey," 1554-57. The library contains upwards of 50,000 volumes. Among the treasures may also be seen the Cardinal's hat belonging to Wolsey and also his chair. Among the pictures in the gallery

may be mentioned "The Nativity" (Titian) and "Christ bearing His Cross" (Mantegna), both from Charles I.'s collection; "Portrait of Vezali" (Tintoret), "Diana and her nymphs" (Giorgione), "Marriage of St. Catherine" (Paul Veronese), two portraits by Vandyke, a fine Triptych, "Madonna and Child" (attributed to Raphael), and "Portrait of General Guise" (Reynolds). There are also paintings by Margaritone, Giotto, Filippo Lippi, specimens of the earliest Italian masters given by the Hon. W. T. H. Fox-Strangways, and fragments of Raphael's cartoons given by Mr. Crackerode. Probably the most highly treasured works in the collection are the original drawings by the great masters, including Titian, Leonardo da Vinci, Masaccio, Domenichino, Annibale Carracci, and others.

The rebuilding of Canterbury quadrangle, including the gateway, was commenced in 1773 and completed in 1778, from designs by the elder Wyatt, excepting the south-west portion, which was erected in 1783, Richard Robinson, Archbishop of Armagh, contributing the funds for the purpose. These buildings occupy the site of Canterbury College, founded by Archbishop Islip in 1363 for training the monks of Christ Church, Canterbury, and were given to the College by Henry VIII. Richard was at one time Warden of the old College, and Sir Thomas More was a student there.

In conclusion, I have to express my indebtedness for valuable information I have obtained from the following works:—Ant. Wood's "City of Oxford," Ingram's "Memorials of Oxford," "Early History of Oxford," by James Parker; "Christ Church," by Rev. H. L. Thompson, M.A. (College histories); "Oxford, the Cathedral and See," by Rev. Percy Palmer, M.A. (Bell's Cathedral Series); "Recent Discoveries at Oxford Cathedral," three papers, by J. Park Harrison; "The Colleges of Oxford," by Andrew Clark, M.A.; "Oxford," by G. W. Seignior (series of Historic Towns); "Oxford," by Rev. Edward Blyden (Diocesan Histories), &c.

THE LATE JAMES HENRY COOK.

As briefly mentioned last week the regretted death of Mr. James Henry Cook, architect, of Liverpool. We are now enabled to add further particulars of a career that was full of still more success if it had not been prematurely ended. He was the eldest son of Alderman Thomas Cook, formerly mayor of Birkenhead, and who has been long distinguished in Liverpool as an architect and surveyor. Having intended to become also an architect, James Henry Cook was apprenticed to the late Colonel Walker, who had a large practice

in the city. Having completed his indentures, he became associated with his father, in whose business he assisted for many years. He obtained a silver medal for measured drawings from the Royal Institute of British Architects.

Some twelve years ago he crossed to America, and during his eight years' stay in that country he acquired knowledge that stood him in good stead afterwards. While in America he assisted some of the most prominent architects in New York and Philadelphia. Perhaps the most important work with which he was connected was that of the World's Fair at Chicago, in which he assisted the late Richard Morris Hunt. In Philadelphia he was also associated in several undertakings with Mr. Frank Miles Day. About four years back he returned to England and became connected with the business carried on by his father at 12 St. George's Crescent, Liverpool, the alderman retiring from the architectural department altogether, and leaving that entirely under the control of his son, while he devoted all his energies to valuing. During the last few years Mr. Cook has been brought before the public eye by obtaining the third premium in the Dock Board contest for the new offices which are to be built upon a portion of the old George's Dock site, while again the design he prepared in the recent Liverpool Cathedral competition was admired. Five of the competitors in the latter contest were selected to compete and eight others were highly commended, Mr. Cook being one of the latter and the only Liverpool man to be so honoured. Among his works in Birkenhead are the additions to the Oxton Road Congregational church, and some fairly large contracts which he carried out for Messrs. Buchanan, in the form of an extension to their large mills on the Dock estate and the construction of a large grain silo. He also designed a house for Mr. Thomas Gilton in Budworth Road, while his practice in Liverpool extended to Seaforth, where about two years ago a Congregational church built to his design was completed. Other works were warehouses for Messrs. MacCombish & Co. and Messrs. Robinson & Co., new stabling for Messrs. Edmondson & Co. and Messrs. Pelling, Stanley & Co., a lecture-hall at Chadwick Mount Church, additions and alterations to Liverpool Jewish baths, new offices for Messrs. Powell & Sing, additions and alterations to Dr. Given's house, to Rake Lane Church, Wallasey, and a new house for Mr. A. Lilwall at Hoylake. As recently as June 1 last he formed a partnership with Mr. Otis D. Black. Mr. Cook was in indifferent health towards the close of last year, and he spent six months in Switzerland, deriving considerable benefit from his stay in that grand country. About a fortnight ago alarming symptoms developed, and he was confined to his bed until the end. Illustrations of some of his buildings, as well as articles by him, have appeared in *The Architect*.

ADVANCED AMERICAN PRACTICE.

SOME months ago two young New Yorkers who made up an architects' firm that has a record of winning, entered a competition to design a "model village" for the housing of boys and girls, waifs of the street, says a writer in the *New York Times*. Nearly 100 separate structures would be necessary, and these were to be spread over a tract of rolling country 277 acres in extent. Five architectural firms were invited to submit designs. In commissions—it having been decided to spend something like 1,500,000 dols.—between 70,000 and 80,000 dols. would go to the winner, a notable prize. Besides this, the honour and repute of success would be great.

The manner in which the successful competitors secured the award, and the amount of preliminary work done in order to secure this result, furnish a typical example of what architectural practice has developed into to-day, and show what great business concerns modern architects' offices have become. It has often been said with much shallowness that all the equipment and capital the novelist requires is a table, a pen, some ink and paper; and also it is generally considered that an architect's needs are merely an office, a few pictures and books, drawing paper and colours, and with these any building can be designed. The actual conditions are, however, very different.

By the terms of the competition 500 dols. was to go to each of the five contesting firms towards the cost of preparing their drawings. The winning architects, however, before they made their designs invested literally thousands of dollars in preliminary work. For months before pen or pencil was put to paper they were collecting material on every hand. Only the barest idea of what they would eventually design was then in their minds. First, they realised information must be gathered as to a hundred different conditions.

Not content with the topographical and other details furnished them, they studied these 277 acres on the ground itself, traversing them personally and sending their men over them.

Nor were their own studies and those of their office force sufficient. Every point of view must be considered thoroughly, and thus they sent up a landscape gardener, a surveyor and an electrical expert. These men thrashed out with thoroughness the problems submitted to them, and they made elaborate reports and recommendations, which were all gathered together and gone over by their principals. Slowly the plan began to evolve itself in these architects' minds.

After some weeks the investigations gradually narrowed themselves down. The questions of plumbing, lighting, ventilation, power, grading and beautifying had been considered. The preliminary work was well-nigh over, and the practical necessities having been considered, it was possible to take up the details of architectural design and actual building construction, which heretofore could only be considered generally and roughly. The "model village" had now to be given substance. But the extended studies had themselves worked out the full problem thoroughly.

On a floor of one of the rooms of these offices given over especially to this purpose a topographical map of this site among the hills was laid out. With all the accumulated matter from the experts and their own memoranda, aided by their most expert designers, these architects worked for some days over this. They had now determined very nearly what buildings would be required to fulfil the competition's conditions, and had settled upon their size, general design and character.

Precisely on scale and of the proper shape each building was cut out of pasteboard. With these buildings in miniature, over the map on the floor a serious game of design of much practical value was played. Day after day these men, as their other duties allowed them, would retire into this room and move these flat strips of pasteboard up and down over the topographical floor map, arranging them in every conceivable position and combination, until at last the final plan suggested itself.

It is seldom, of course, that such a great and complicated piece of design comes before an architect. Most frequently it is but a single building with which he has to deal, and not a proposition involving acres of ground. Yet the principle and the problem are the same. The art end has come to be but a fragment of the work involved, though an important fragment, the shell that must harmoniously combine with all else, yet is but one of a dozen considerations.

In fact, the days when the architect was, before all, a man whose chief merit was that he could make a charming design, afterward fitting the interior and the planning generally to this exterior, have long since passed and gone. One of the most distinguished architectural firms of the country, a concern that is famous for its artistic designs, and does its greatest work on fine residences, libraries, splendid public buildings and structures generally of the monumental order, has but one of its three partners who pays any attention to design. This man, too, spends vastly more time in the securing of important contracts than he does in actually drawing or planning. A second of the partners concerns himself entirely with the problems of construction, supervising his engineers and experts. The third partner handles the firm's finances, which are as great and as complicated as those of a large mercantile house, an expenditure of thousands of dollars a week being necessary to keep things running and pay the dozens of men employed.

So remarkably, indeed, has architecture developed that recent years have seen an extraordinary phase of it. Latterly there has come into the building field one enormously big construction company and several others very nearly as large. These enterprises concern themselves solely with the putting up of commercial edifices. They are highly capitalised, and have large funds to draw upon. Expert financiers and engineers make up their chiefs of staff, and each company is compactly divided into departments, precisely as is a manufactory. With the exception that the product is in each case a big building built on its own site, instead of one of a thousand articles made under one roof, these companies are purely and simply combinations of manufacturers.

Relatively the architecture here is a minor detail. It is the engineering problems, the work of actual stone, brick and steel construction, that stand out most prominently. Much of the architecture is purchased on order for the individual structure, as any expert service would be. In some cases, indeed, for buildings of this nature an architect is not needed. So simple are the problems in that direction that some of the members of the construction company's staff can easily take them in hand. When they are rather beyond this the company merely engages an architect to design the exterior. The architect has simply to make the front. In all its details otherwise the building has been laid out. He gets his fee and the building goes up successfully. It has been a case of the experts engaging the architect instead of the architect the experts.

Commercial building construction has not cut seriously into the profession of architecture, however, though it has had an influence in making the modern architect's office more than

ever a business place. Despite the multiplication of construction demands, the gaining of every inch of rentable floor space possible, the placing of highly developed systems of ventilation, plumbing, heating, chutes, electric wires (which now, according to the very best methods, must be carried in special pipes), the designer is yet all powerful, and the firm that lacks on the first rank is hopelessly behind in the race. But nowadays the designer must be an engineer too, almost an expert in electricity, materials, steel frames, heating and pipes of all sorts and interior decorations. He can hire experts, but he has got to know enough about all these subjects to get the meat out of their reports. He must be a sufficiently good business manager to finance his firm when it is carrying along half a dozen big jobs. One little item alone in his expense is that first-quality draughtsmen will cost him 40 dols. a week. It would be difficult to carry an architect's office through in time of rush of big work without a number of these.

One of the biggest prizes of the past year among the architects was a huge Government building. Design in this case was all-important. It was not a towering skyscraper, where cubic foot of space was the first consideration, and the practical details, after being settled, had then to be given a touch of beauty, but a structure in which beauty must be the starting-point. Two men, each less than forty years of age, made up a team that set out to win it, and did eventually win. The decision being reached that they should compete, one of these partners took his grip one afternoon and went out into the country. No word from the office, it was agreed, was to reach him; he was to be lost to the world. In four days he was back with a number of sketches. The building that was afterwards approved lay before them in the rough.

And then the work was just begun. The little sketches were like an author's notes for a novel—they but suggested the way. Hundreds of detail plans had to be drawn, sets of calculations in line and dot, masses of black and red ink, all worked up to the final series of plans that were submitted. Ornamental studies, taking weeks of care, had to be prepared; there were drawings of floors in detail, of great halls, of steel and stone construction, laid out to the veriest point.

What investment in actual money, to say nothing of time, preliminary work of this sort costs the modern architect it would be difficult to say, but a thousand dollars here and there would be but a fraction. One architect of the practice calculated the other day that fully 50 per cent. of his fees would have to go in actual working expenses—that is, his office took in during the year 50,000 dollars in commissions there would be but 25,000 dollars of it clear profit, and only if the office had been administered on a most careful basis.

"And let me tell you," said this architect, "50,000 dollars in commissions means 1,000,000 dols. worth of building done during the year. It has to be a pretty good firm to get that quantity—a firm that is fortunate and has some sort of reputation for being successful in big things."

Of course, no living man with anything of an architectural practice could spare the time required to-day to design a plan out the elaborate interiors made necessary by modern tendencies. What the big architect does is simply to train. He trains men into his way of thinking, his way of looking at a problem of decoration. As he gets the opportunity he does this and that over. The understudy works it out, precisely the man himself would have done. "Organisation is the most important thing to-day," a certain architect of New York recently in conversation. "To succeed you must build up an organisation. The real science of architecture in these days is just that. You know just what is to be done; you can just do it all. Now, when you have ten or twenty men working for you, you carry out the work precisely in that manner, there is your organisation. All it needs is to be started; directed by you. Architecture has come to be too big to be carried out otherwise."

And now the architect is coming into a field, that of the decoration. In its entirety this includes not only the treatment of the walls, but hangings as well, and often floor coverings and furniture. Not only are many more beautiful houses being built than formerly, but these are increasing in comparative beauty, and the city house is steadily growing more magnificent. Besides this, business buildings are demanded more and more in the way of decorative adornment within, and banking institutions especially are making use of ornate finishings and furnishings.

For the architect to get the best effect for his building must take into consideration all of these. Much of it is his own design, all of it he must at least supervise and see through from the beginning to the end. What he actually does in practice to-day is to plan out colour schemes and effects for each of the rooms, especially if this be a commercial establishment. Directly under his supervision the walls are handled, and frequently the hangings. In the interior as well as exterior comes to be his own.

There are some people, however, who think the honours and emoluments of the modern architect are too great, even considering his duties and the many expenses of carrying on his business. An interesting contention is brewing between government officials and the American Institute of Architects. The Government, it is understood, is to claim that for the new big Government buildings to be erected very speedily in Washington the architect's fee is excessive. It has been suggested that officers of the Engineers corps of the army superintend the erection of these buildings, and that the architects' work be concluded with the making of their plans. In other words, this means that architects should be engaged merely for architectural matters, and that the construction should be put in the hands of Government employes.

TESSERÆ.

Erasmus at Canterbury Cathedral.

THE visit of Erasmus to Canterbury is alluded to by all historians. He entered the cathedral by the south porch, where he observed the statues of the three knights who were Thomas à Becket. In the nave he noted certain books tied to the pillars, and amongst them the gospel of Nicodemus. Iron railings separated the nave from the space which was between that and the choir. Many steps ascended to this space, and under them a vaulted passage led to the north part of the transept, where he was shown the small ancient wooden tomb of the Virgin. From this place he was conducted down a crypt and shown the skull of St. Thomas and his ordinary ornaments. Then he returned and went to the choir, where on the north side he was shown a multitude of relics and examined the tabula and ornaments of the altar and the riches beneath, the presence of which Midas and Cræsus would have envied beggars. He was then led to the sacristy and the vestments, candlestick, &c., were shown to him, together with the staff of St. Thomas, his pallium and sudarium, which were specially exhibited by special favour. After this he was taken to the upper part of the church behind the high altar, where in a chapel, probably the corona, was the image of St. Thomas gild decorated with precious gems. In the next place the shrine was opened for his inspection, the prior pointing out with a white wand each jewel in succession and mentioning its name, value and the donor. Then he returned to the crypt and was shown the chapel of the Virgin and its riches, and finally was again brought to the sacristy to see an old black chest filled with rags which had once belonged to Becket. He then took his leave.

Mediæval Rome.

The city of the Cæsars had sunk to its lowest degradation at the end of the eighth century; its old habitations had been destroyed, even the course of most of its streets obliterated; the remains of antiquity were confined to the bare walls of palaces and temples, and a few other monuments of unusual length and solidity. Of these remains a list is given by a biographer of the next age. It includes the baths of Alexander, Commodus, Trajan, Sallust, Diocletian and Constantine; temples of Jupiter and Minerva; the Roman Forum and that of Trajan; the three circuses; the arches of Severus, Titus, Theodosius and Valentinian; the Flavian and Antonine amphitheatres; the Capitol, the Septizonium, the tomb of Nero, and another pretending to be that of Pontius Pilate; the theatres of Pompey and Marcellus; the Trajan and Antonine columns; a Nymphaeum, an obelisk, several remains of aqueducts and porticoes, together with various specimens of ancient sculpture. These monuments, it will be observed, for the most part exist, but the demolition of the ancient city had already advanced at this period almost to the point at which it has now arrived a thousand years later. A change, however, now occurs in the history of Rome. The Popes, acknowledged masters of the venerable city, attempted every interval of domestic tranquillity to repair the most serious injuries she had suffered. The Aqua Virgo was made to convey water to the dwellings about the Pantheon, and Claudia to those which encircled the Lateran. A new wall was rising under the protection of St. Peter's, which Leo VI. fortified in 846 and gave it the name of the wall of Leonina, now the Borgo. Rome had become a cluster of towns, one of which grew up around each of her imperial sanctuaries, and from this time her records teem with tales of the building of new churches, and even the restoration of old ones. The papal city had itself become an antiquity. The strongest monuments of the old city still existing were seized by the barons and converted into castles. Even the monasteries sought to protect themselves by similar means. Thus the convent of St. Gregory on the Esquiline had its outposts in the Septizonium and the Arch of

Constantine, while other religious houses made use of the columns of Trajan and Antonine for belfries. In the twelfth century the noble family of the Frangipani had possession of many ancient buildings, such as the Colosseum, the Circus Maximus, the Septizonium, the arches of Titus and Janus; the Orsini occupied about the same time the mole of Hadrian and the theatre of Pompeius; the Colonna the mausoleum of Augustus and the Baths of Constantine; the Savelli maintained themselves in the theatre of Marcellus and the tomb of Cæcilia Metella; the Corsi had fortified the Capitol and were in possession of the basilica of St. Paul. The Pantheon was defended as a fortress for the Pope. We may suppose that the defiant attitude assumed by the holders of these places of strength provoked mutual hostilities, but they were preserved at least from natural decay by the pains taken to fortify them. We can trace, however, some of the damage inflicted upon them in the struggle between the popes and emperors, and we may guess at more. Rome was attacked more than once by the Emperor Henry IV. In the siege of 1082 the portico of St. Peter's suffered injury; in the following year that of Hadrian's mole, or Castle of St. Angelo, was destroyed. The assaults were generally directed against the Transtiberine portion of the city, and in 1084 the Borgo was overthrown. At the same time the long colonnade which connected St. Paul's beyond-the-Walls with the city was demolished. Thus far the injury inflicted had lighted chiefly on objects comparatively modern, but the emperor now penetrated the walls and made a furious attack on the Capitol, which caused the ruin of many ancient remains. The outrages of the imperialists, however, were far exceeded by those of the Normans and Saracens, who recovered the city for Pope Gregory VII. under Robert Guiscard. These savage allies burnt their way from the Flaminian Gate to the Antonine column, and they assaulted with barbarian violence both the Capitol and the Colosseum, and laid waste the area of the city from thence to the Lateran. The greater part indeed of this space was at this time uninhabited, and even uncultivated. The remains of the several borgos were thus separated by desert tracts; and William of Malmesbury in writing of this lamentable period could describe Rome as "quite a small city." At the end of this century, under Innocent III., it is said to have contained only 35,000 inhabitants. In the thirteenth century the violence of the nobles was brought in some degree under the control of the municipal government, and the senator Brancalone caused the demolition of 140 baronial "towers." These were perhaps for the most part turrets of brick erected on the summit of the ancient monuments, but their destruction extended in many cases, as we are specially assured, to the monuments themselves; the extent, however, of the demolition has probably been exaggerated—at least, the check it inflicted was incomplete and transient. We continue to hear again and again of the feudal castles in Rome; as many as forty-four existed, it is said, at a much later period in a single borgo.

Thorwaldsen as a Sculptor.

Thorwaldsen is considered by his admirers the greatest of modern sculptors, and many have not hesitated to place him far above Canova and to compare him with the antique. This is, however, hardly the rank he will hold with posterity; his style is uniform to monotony, though many individual figures are bold, solid and of beautiful proportions. His *beau idéal* appears to have been something between the Antinous and the Discobolus of Nanydes, as it is sometimes called; but as his subjects are seldom heroic, he seldom required more than a moderate expression of heroic vigour or robust strength and activity: in this respect and in execution generally he was much surpassed by Canova, but still more so in the grace of the female form, in which Thorwaldsen certainly did not excel. His females are much too square in the frame, the head and shoulders being generally heavy; and in no instance do we find in his female figures, in full relief, that beautiful undulation of line and development of form characteristic of the female, which is displayed in the antique, in the works of Canova and in those of some other modern sculptors, as, for instance, the Ariadne of Dannecker. Basso-relievo was a favourite style with Thorwaldsen, and a great proportion of his works are executed in this style. Of this class some of his minor works are the most expressive; but the principal are the Triumph of Alexander and the Procession to Golgotha, which is the frieze of the cathedral church of Copenhagen, immediately below the numerous group of John preaching in the Wilderness, in full relief, in the pediment; in the vestibule are the four great prophets; Christ and the Twelve Apostles are above and around the altar. The Triumph of Alexander, of which there is a copy in marble in the palace of Christiansburg (the first marble copy was made for Count Somariva's villa on the lake of Como) is a long triumphal procession in two divisions, one meeting the other. In the centre, Alexander, in the chariot of Victory, and followed by his army, is met by the goddess of Peace, followed by Mazæus and Bagophanes with presents for the conqueror. The subject is taken from the

work of Quintus Curtius. Much of the frieze is symbolical; perspective is nowhere introduced. The whole arrangement is beautiful, especially that portion which comes from Babylon, comprising the General Mazæus with his family; female figures strewing flowers; Bagophanes placing silver altars with burning incense, musicians and attendants leading horses, sheep, wild animals and other presents for the conqueror; next to these are symbolic representations of the river Euphrates and the peaceful occupations of the Babylonians. The human figures of this work are admirable, as is also the management of the costumes; but the horses are below mediocrity both in design and modelling, especially that of Alexander himself, Bucephalus, which is led following the chariot of Alexander. It is a complete distortion. None of the horses of Thorwaldsen are successful. The colossal animal of the Poniatowski monument at Warsaw, and that (of smaller proportions) of the monument to Maximilian of Bavaria at Munich are heavy and graceless, and wanting in the finer characteristics of form which belong to the horse. The works of Thorwaldsen do not display extraordinary power or fertility of invention—Flaxman's distinguishing faculty. Flaxman's outlines belong not the less to the province of sculpture from the circumstance of their not having been executed in marble. Most of them are designed and well adapted for basso-relievo.

Columnar Notation.

Simple as are the plans of Grecian temples, there are many terms required to express their varieties in regard to the application of columns, besides those denoting the number of columns in front, that is, beneath the pediment. Thus, if there were columns only in front, the building was termed *prostyle*; if at each end, *amphiprostyle*; if there were also colonnades along the sides, it was said to be *peripteral*, that is, with wings (aisles) or colonnades quite round it. When there were two rows of columns, one behind the other, it was termed *dipteral*. Again, where a range of columns was placed between antæ, forming the extremities of walls at right angles with such colonnade, it was said to be in *antis*. This was generally the case with the pronaos, the vestibule or inner portico behind the columns in front. According to the number of columns in front, porticoes are said to be *tetrastyle*, that is, with four columns; *hexastyle*, with six; *octastyle*, with eight; *decastyle*, with ten; and *dodecastyle*, with twelve, the greatest number that can very well be brought beneath a pediment; and even of these two last the examples are exceedingly rare. If instead of columns at the angles there were antæ, then the number of columns alone was reckoned as before, and would dominate what would be equivalent to a portico containing two more; thus a *distyle* in *antis*, *i.e.* two columns between two antæ, would be equal to a *tetrastyle*, as in both there would be three intercolumns; a *tetrastyle* in *antis* would be equal to a *hexastyle*, and so on. By means of this simple mode of numerical notation, a couple of words suffice to explain in the concise manner what even a long description may leave doubtful; for instance, when we say that a portico is *hexastyle Ionic*, we clearly specify the order and the number of columns in front; and it is upon this latter circumstance that so much of particular character depends.

Illuminated Manuscripts.

The ornamental and initial letter decorations of MSS. are almost infinite, and but very few of the names of these decorators have been preserved. Some of the arabesque and floral decorations are extremely elaborate and beautiful, and there are also many classes of initial letters which display extraordinary ingenuity, skill and patience. The red ink or minium, cinnabar, was long used very sparingly by the Greeks of the Lower Empire; it was the sacred *enkauston*, and was at one time used only by the emperor or for his name to imperial rescripts, as confirmed by Leo, A.D. 470. This continued until the thirteenth century. The custom was imitated in the West by Charles the Bald in the ninth century, but was not continued by his successors. Gold and silver letters were common in the earlier centuries, sometimes written on vellum of a purple or rose colour. Julius Capitolinus, in his "Life of the Emperor Maximinus the younger," mentions a present to the emperor from his mother of the poems of Homer written on purple vellum in gold letters; this was at the beginning of the third century. By the end of the fourth century such MSS. of devotional books became common, but in other classes of literature they were still rare. The Codex Argenteus of Ulphilas, in gold and silver letters on purple vellum, of the year 360, is the most ancient specimen extant of this magnificent description of calligraphy; other early specimens are the Book of Genesis in the library at Vienna, the Psalter of St. Germain des Près, and the fragment of the New Testament in the Cottonian library in the British Museum (Titus, c. xv.)—all of the fifth and sixth centuries. Eddius, the biographer of Wilfrid, archbishop of York, mentions a copy of the Gospels of this description, which that prelate presented to his church; this was in the seventh century. In later times

only parts of MSS. were thus richly executed, as the titulus. In some Greek MSS. the vellum was burnished with gold on both sides where it was to be written upon, and was then richly ornamented with coloured arabesques or borders. The more beautiful MSS. of the eighth, ninth and tenth centuries are executed in the gold letter on white vellum. The Harleian copy of the Gospels, and the Bible and "Hours" of Charles the Bald, at Paris, are among the finest examples of this kind of writing extant. The Charter of King Edgar to a new minster, or Hyde Abbey, at Winchester, in the year 960 (MSS. Cott. Vesp. A. viii.), is the only remarkable instance that occurs of gold writing in England. Prefixed is a portrait of Edgar between the Virgin and St. Peter. This MS. is much damaged, and the ink has fallen off in many places. In the fourteenth century gold and silver writing became comparatively common. When MSS. were written altogether in capitals, the initials were in general not larger than the other letters. The large illuminated initials are said to have commenced first among the Greeks about the close of the seventh century. In subsequent centuries large initials were usual, and they gradually became more complicated and elaborate down to the twelfth century, when they attained a degree of size, ornament and intricacy that they have not in these respects been surpassed. These letters are ornamented with all kinds of fanciful figures, composed of men, animals, birds, fish and flowers. Montfaucon, in his "Palæographie," gives a complete alphabet from MSS. of the ninth and tenth centuries, of what the Benedictines call, from their illustration of the text, "Lettres Historiées." They occur most frequently in Visi-Gothic and Franco-Gallic MSS.

The Roman Insula.

This term bears two distinct significations. It originally denoted a mass of building, consisting of one or of several houses surrounded on all sides by streets or lanes, and completely detached from other buildings. Even where an insula contained only one regular mansion there were frequently shops in different parts of the ground storey, as is common in Roman and Neapolitan palaces in modern times. Such a mass of building was frequently raised to the height of several storeys and laid out in lodging-houses for the accommodation of single individuals or of small families belonging to the middle or lower classes, these individuals and families living completely apart, but still under the same roof, as in the place in the flats of a Scotch "land" or the "étages" of a French hotel. Hence the term is employed to denote a set of lodging-house or set of apartments, and the person employed by the proprietor to exercise a general superintendence of the whole of the separate insulæ which were included in a large insula was named "insularius," his duties being proportional to those of a concierge in French establishments of a similar nature. A mass of building containing not only a mansion called the House of Pansa in Pompeii, but a number of shops and small lodgings, was an insula in this sense; where the lodgings had no communication with the House of Pansa they were termed insulæ in the second sense.

GENERAL.

The Gold Medal offered for works shown in the International Exhibition of Art in Venice has not been awarded, and there will be a second contest. Forty-five works have been submitted to the judges.

The Caissons for the new bridge at Bâle are now being laid. The old bridge over the Rhine, part of which dates from the beginning of the thirteenth century, has to be superseded owing to its inadequacy to sustain the increased traffic.

The Mafeking Town Council have decided to light the town with electricity, for which purpose a loan of 6,000 £ has been raised.

A Committee has been formed in Paris in order to make arrangements for the erection of a memorial to Arthur Holmes, the English composer, who long resided in Paris.

A Competition confined to German architects has been arranged for a Stadthaus in connection with the Rathhaus in Bremen. The prizes offered are one of 8,000 marks, one of 6,000, two of 3,000 and two of 2,000 marks. The plans are to be sent on or before December 31.

The Louvre has been enriched among other pictures by the *Defeat of the Cimbræ* by Decamps and the *Portrait of Delacroix*.

The International Society of Sculptors, Painters and Gravers shipped from Liverpool to Philadelphia last week a collection of works by its members, numbering about 100, for exhibition in the various American academies and galleries, including Philadelphia, Pittsburg, Chicago, Boston, New York &c., and the collection will be shown in the St. Louis Museum during the Exhibition next year.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

AYLESFORD.—The Maidstone Town Council invite designs and estimates for a stone single-span bridge over the Medway at Aylesford, Kent. Premium 100 guineas offered for design named premier place. Details can be obtained on application to the Town Clerk, Maidstone.

BLACKPOOL.—Aug. 31.—Competitive drawings are invited for new offices to be erected at the corner of Sefton Street and Market Street, Blackpool. The architect whose design is selected will be appointed to carry out the work. The competition is limited to architects having offices and practising in the water area of the Fylde Water Board. Mr. C. H. Wright, 34 Victoria Street, Blackpool.

BRIGHTON.—Nov. 9.—Designs are invited for a new hospital. Premiums of 50l., 30l. and 20l. will be paid to the first, second and third premiated designs respectively. Mr. J. R. Holmes, hon. secretary, Brighton and Hove Hospital Committee, 76 West Street, Brighton.

HEYWOOD.—Sept. 14.—Competitive designs are invited for a library building to be erected in Church Street at a cost of 4,500l. Premiums of 30l., 20l. and 10l. will be awarded for designs adjudged of sufficient merit and placed first, second and third in order respectively. Mr. J. Ainsworth Settle, Municipal Buildings, Heywood, Lancs.

HOWDEN.—Sept. 12.—Plans and estimates are invited for improving and extending the sewerage of the contributory place of Howden. The successful competitor will be awarded a sum of 15l. and the usual commission for superintending the execution of the works. Mr. Henry Green, clerk.

IRELAND.—Sept. 30.—The Great Southern and Western Railway Company offer a prize of 20l. for the best design and specification of workmen's cottages, built either semi-detached or in terraces. Mr. Francis B. Ormsby, secretary, Knightsbridge Terminus, Dublin.

LEYLAND.—Sept. 26.—Plans are invited for the laying-out and development for municipal and other purposes of about 11,902 square yards of land in Church Road and Sandy Lane, Leyland, Lancs. A premium of 15l. 15s. is offered to the author of the plan considered to be the best design. Mr. M. H. Wilkinson, surveyor, 21 Towngate, Leyland.

LONDON.—Oct. 2.—Designs are invited for a public library to be erected in Brunswick Road, Bromley, E. Premium 75l. for design placed first, and one of 25l. for second. Mr. Leonard Potts, town clerk, Council Offices, High Street, Poplar.

RAWTENSTALL.—Oct. 12.—Competitive designs are invited for free library, town hall and assembly-room buildings. Premiums of 100l., 50l. and 30l. respectively will be awarded. Mr. A. W. Lawson, borough surveyor, Municipal Offices, Rawtenstall.

SCOTLAND.—Sept. 12.—Competitive plans are invited for alterations on and additions to the Stonehaven town hall. Mr. George Murdoch, borough surveyor.

SCOTLAND.—Sept. 22.—Competitive plans are invited for the erection of a hospital and offices. Conditions of the competition and full particulars may be obtained from Mr. J. E. Shaw, clerk to the Lunacy Board, County Buildings, Ayr.

CONTRACTS OPEN.

AMBLE.—Aug. 27.—For the erection of a house and shop in Queen Street, Amble, Northumberland. Mr. E. D. Richardson, 7 Gibson Street, Amble.

AYLESBURY.—Sept. 1.—For repairing, painting and decorating the town hall. Mr. J. H. Bradford, surveyor, Town Hall, Aylesbury.

BATLEY.—Sept. 4.—For additions to the town hall. Messrs. Walter Hanstock & Son, architects, Branch Road, Batley.

BATLEY.—Sept. 5.—For the erection of an approach tower to the Independent Methodist chapel, Cambridge Street, Batley. Mr. O. J. Kirby, borough surveyor, Branch Road, Batley.

BEDLINGTON.—Aug. 25.—For the erection of twenty-six cottages at the Dr Pit, Bedlington. Mr. Weeks, Bedlington.

BERMONDSEY, S.E.—Sept. 3.—For the construction of offices, &c., at the town hall, Spa Road. Mr. R. J. Angel, borough surveyor, Town Hall, Spa Road, S.E.

BERMONDSEY.—Sept. 8.—For the erection of buildings in connection with extensions to the dust-destructor house, electric light station, boiler-house, &c. Mr. R. J. Angel, borough surveyor, Town Hall, Spa Road, S.E.

BIRMINGHAM.—Aug. 25.—For additions to the head post office at Birmingham. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, &c., Storey's Gate, S.W.

LONDON OFFICE AND SHOWROOMS, 27 CHANCERY LANE, W.C.

BIRMINGHAM.—Sept. 16.—For the erection of engine and boiler-houses, including seatings for five Lancashire boilers and the construction of a new flue, adjoining the present pumping station at Monument Lane, Edgbaston, Birmingham. Mr. Edward Orford Smith, town clerk, Council House, Birmingham.

BRISTOL.—For the erection of the Bell inn, Two Mile Hill. Messrs. C. & C. Thompson, architects, Athenæum Chambers, Nicholas Street, Bristol.

BRISTOL.—Aug. 31.—For the erection of one or two ware-houses at Cumberland Basin. Mr. W. W. Squire, engineer, Engineer's Office, Underfall Yard, Cumberland Road, Bristol.

BRISTOL.—Sept. 10.—For the erection of school buildings in Hanham Road, Kingswood, near Bristol, to accommodate 900 children. Mr. John Mackay, architect, Richmond Place, Kingswood, near Bristol.

BURNLEY.—Aug. 24.—For the erection of a Wesleyan church, Manchester Road, Burnley. Messrs. Waddington, Son & Dunkerley, architects, Mansfield Chambers, St. Ann's Square, Manchester.

BURTON-IN-LONSDALE.—Aug. 31.—For the erection of a Wesleyan Sunday school and classroom at Burton-in-Lonsdale. Mr. Robt. Richardson, Halfway House, Cantsfield, Kirkby Lonsdale.

CAIRO.—Feb. 1, 1904.—For the construction of three bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CANNOCK.—Sept. 7.—For the construction of an iron and wood infectious disease isolation hospital, comprising administration and mortuary blocks and wards to accommodate sixteen patients. Mr. Herbert M. Whitehead, surveyor, Penkridge, near Stafford.

CANNOCK.—Sept. 8.—For certain works at the workhouse, Cannock, Staffs, in connection with (a) rebuilding and additions to the laundry and washhouses, and (b) the provision and fixing of steam engine and laundry machinery. Mr. Ashton Veall, architect, 84 Darlington Street, Wolverhampton.

CARLISLE.—Sept. 1.—For the erection of twelve houses in Margery Street, Carlisle. Messrs. Johnstone Bros, architects, 39 Lowther Street, Carlisle.

CHESTER.—Aug. 31.—For the erection of twelve cottages on part of the Tower Field Gardens, Dee Basin Road, Chester. Mr. J. H. Dickson, deputy town clerk, Town Hall, Chester.
